Vol. I

TRANSCRIPT OF RECORD

(Pages 1 to 512)

Supreme Court of the United States

OCTOBER TERM, 1944

No. 296

PANHANDLE EASTERN PIPE LINE COMPANY, ILLINOIS NATURAL GAS COMPANY AND MICHIGAN GAS TRANSMISSION CORPORATION, PETITIONERS,

vs.

FEDERAL POWER COMMISSION, CITY OF DETROIT, COUNTY OF WAYNE, MICHIGAN, ET AL.

ON WRIT OF CERTIORARI TO THE UNITED STATES CIRCUIT COURT OF APPEALS FOR THE EIGHTH CIRCUIT

PETITION FOR CERTIORARI FILED JULY 28, 1944.

CERTIORARI GRANTED JANUARY 8, 1945.

VOL. I.

TRANSCRIPT OF RECORD.

United States Circuit Court of Appeals

EIGHTH CIRCUIT.

No. 12,466

PANHANDLE EASTERN PIPE LINE COMPANY, A CORPORATION, ILLINOIS NATURAL GAS COMPANY, A CORPORATION, AND MICHIGAN GAS TRANSMISSION CORPORATION, A CORPORATION, PETITIONERS,

vs.

FEDERAL POWER COMMISSION, CITY OF DETROIT, MICHIGAN, COUNTY OF WAYNE, MICHIGAN, MICHIGAN CONSOLIDATED GAS COMPANY, A CORPORATION, AND MICHIGAN PUBLIC SERVICE COMMISSION, RESPONDENTS.

PETITION TO REVIEW AND SET ASIDE ORDER OF FEDERAL POWER COMMISSION.

FILED FEBRUARY 6, 1943.

United States Circuit Court of Appeals

EIGHTH CIRCUIT.

No. 12,466

PANHANDLE EASTERN PIPE LINE COMPANY, A CORPORATION, ILLINOIS NATURAL GAS COMPANY, A CORPORATION, AND MICHIGAN GAS TRANSMISSION CORPORATION, A CORPORATION, PETITIONERS,

vs.

FEDERAL POWER COMMISSION, CITY OF DETROIT, MICHIGAN, COUNTY OF WAYNE, MICHIGAN, MICHIGAN CONSOLIDATED GAS COMPANY, A CORPORATION, AND MICHIGAN PUBLIC SERVICE COMMISSION, RESPONDENTS.

PETITION TO REVIEW AND SET ASIDE ORDER OF FEDERAL POWER COMMISSION.

FILED FEBRUARY 6, 1943.

Index, Volume I.

Exhibits:		
1, Statement of operating Results of Panhandle Eastern Pipe Line Company and Michigan Gas Transmission Company, 1938-1940	10775	4012
Operating Results	10775	4012
Cost, and Cost Less Reserves, of Plant and Operating Results as of December 31, 1938	10777	4013
Cost, and Cost Less Reserves, of Plant and Operating Results as of December 31, 1939	10778	4014
Cost, and Cost Less Reserves, of Plant and Operating Results as of December 31, 1940	10779	4015
Working Capital Estimate, December 31, 1938-39-40	10780	4016
Working Capital Estimate Approximate Payroll Basis, December 31, 1940	10782	4017
2, Determination of possible Revenue Reduction of Panhandle Eastern Pipe Line Company and Michigan Gas Transmission Company	10783	4018
3, Excerpts from Registration Statement of Panhandle Eastern Pipe Line Company filed with the Securities & Exchange Commission, February 12, 1937, with respect to Gas Reserves	10785	4019

	Original	Print
4, Excerpt from Registration Statement of Panhandle Eastern Pipe Line Company filed with the Securities & Exchange Commission, November 13, 1940, with respect to Gas Reserves	10786	4021
5, Excerpts from Registration Statement of Panhandle Eastern Pipe Line Company filed with the Securities & Exchange Commission, November 13, 1940, with respect to Design, Construction and Maintenance of Property	10789	4025
6, Statement of Operating Expenses and Taxes at 100% Load Factor Operation	10791	4029
7, Statement as to necessary Price per M. C. F. at 100% Load Factor	10793	4030
8, Statement of estimated Effect of 100% Load Factor on earning Power of System	10795	4030
9, Statement of Factor affecting the Nature and Magnitude of reported Net Incomes	10796	4031
10, Statement showing Effect of Variation in accounting Practices on Reported Incomes of an Enterprise	10799	4034
11, Chart showing Relation of Yield of United States Treasury Bonds and Notes	10800	4035
12, Statement showing United States Treasury Bond Yields	10801	4037
13, Chart showing History of Yields of United States Bonds, 1920–1939	10806	4045
14, Average Yield of United States Treasury Bond	10807	4047
14-A, Securities & Exchange Commission Releases Nos. 2778 and 2834 — Findings and Opinion of the Commission in the Matters of Panhandle Eastern Pipe Line Company, et al	10808	4047

Index, Volume IX.

Order of Securities & Exchange Commission Denying Applications in Part and granting Applications in Part	10842	4087
Supplemental Order of Securities & Exchange Commission amending Findings and Opinion	10844	4089
17, Miscellaneous Data concerning Property and Operations of Panhandle Eastern Pipe Line Company	10848	4090
Schedule 1, Panhandle Eastern Pipe Line Company System Compressor Stations	10848	4090
Schedule 2, List of Communities receiving Service directly or indirectly from Panhandle Company including Population and Number of Customers as of June 30, 1941	10849	4091
Schedule 3, List of Industrial Customers receiving Service direct from Panhandle Company System, June 30, 1941	10853	4099
Schedule 11, Panhandle Eastern System Summary — Miles of Pipe by Sizes, June 30, 1941	10926	4101
30, Testimony of Rufus M. Smith	10958	4103
Schedule 2, Estimated Original Gas Content in the Texas Panhandle Field under Acreage constituting Reserves of Panhandle Eastern Pipe Line Company as of July 1, 1941	10986	4125

	Original	Print
Schedule 3, Estimated Remaining Gas Content in the Texas Panhandle Field under Acreage constituting Reserves of Panhandle Eastern Pipe Line Company as of July 1, 1941	10987	4125
Schedule 5, Comparison of Open Flow Potentials in Texas Panhandle Gas Field	10990	4129
Schedule 6, Gas Acreage owned and under Gas Purchase Contracts held by Panhandle Eastern Pipe Line Company as of June 30, 1941	10991	4131
Schedule 7, Hugoton Production to Argus Natural Gas Company, Inc. by Panhandle Eastern Pipe Line Company, et al	10992	41
Schedule 8, Texas Production to Panhandle Eastern Pipe Line Company	10	4135
Schedule 9, Hugoton Production to Panhandle Eastern Pipe Line Company	0997	4143
Schedule 10, Hugoton Production to Panhandle [illegible]rn Pipe Line Company	11000	4149
Schedule 11, Analysis of Cumulative Produ[illegible] to Main Line to and including Fiscal Month of [illegible]e 1941	11003	4155
Schedule 12, Comparative Statement [illegible] Production and Purchases from each District for the two Years ended June 22, 1940 and June 22, 1941	11004	4157
36, Testimony of Glenn G. Bartle	11010	4159
Schedule 3, Estimated Original Gas Content in the Hugoton Field, (Kansas, Oklahoma and North Texas Panhandle), under Acreage constituting Reserves of Panhandle Eastern Pipe Line Company as of July 1, 1941	11038	4176
Schedule 4, Estimated unmetered Gas from Panhandle Eastern Pipe Line Company Wells in the Hugoton Field Kansas, connected to Argus Natural Gas Company, Inc. as of July 1, 1941	11041	4181
37, Testimony and Exhibits, Market Value of Leases of Panhandle Eastern Pipe Line Co.	11047	4187
R. J. Wallace	11047	4187
Summary of Market Value of Leases	11064	4199
38, Basic Statistics used in calculating Interest, ad valorem Taxes and operating Expense attributable to unused Capacity	12159	4203
39, Reproduction Cost New of Plant, Property and Business of Panhandle Eastern Pipe Line Company and subsidiary Companies as of June 30, 1941	12162	4206
Letter P. McDonald Biddison, Consulting Engineer, to Panhandle Eastern Pipe Line Company, August 29, 1941	12163	4206
Statement relating to Reproduction Costs—New—June 30, 1941	12164	4207
Summary	12165	4207
39-A, Reproduction Cost New of Plant, Property and Business of Panhandle Eastern Pipe Line Company and subsidiary Companies as of June 30, 1941	13130	4208
Letter P. McDonald Biddison, Consulting Engineer, to Panhandle Eastern Pipe Line Company, August 2[illegible], 1941	13130	4208

VI

	Original	Print
Statement relating to Reproduction Cost New—June 30, 1941	13131	4209
Summary	13133	4209
40, Table showing estimated Main Line Sales, years 1941-1946, inclusive	13149	4211
41, Graph showing Sales and Gas Plant by Years, Panhandle Eastern Pipe Line Company and Subsidiary Companies	13150	4213
42, Testimony of C. H. Hinton relating to Future Capital Expenditures and Operating Expenses in Production and Gathering System West and South of Liberal, Kansas	13151	4215
43, Schedules presented in connection with the written Testimony of C. H. Hinton	13193	4244
Schedule 1, Additional Capital Expenditures required to produce and gather Basic Load, or Present Requirements	13194	4244
Schedule 2, Additional Capital Expenditures required to produce and gather Anticipated Increased Load	13195	4244
Schedule 3, Estimate of Operation and Maintenance Costs —west of Liberal Panhandle Field — Basic Load	13196	4245
Schedule 4, Estimate of Operation and Maintenance Costs — west of Liberal Panhandle Field — Estimated Future Load	13199	4251
Schedule 5, Probable Production from Panhandle Eastern's own Wells and Wells under Gas Contracts (Panhandle Field) during the Period July 1, 1940 to December 31, 1956	13202	4257
47, Panhandle Eastern Pipe Line Company and Subsidiary Companies, future Capital Requirements, Gas Transmission Facilities, Liberal Station and Eastward	13206	4257
48, Statement showing Balance Sheets per Books Panhandle Eastern Pipe Line Company and Subsidiary Companies, as at each December 31, 1930 through 1940 and as at June 30, 1941	13207	4259
49, Income Statement per Books — Period from April 1, 1932 to December 31, 1941	13210	4265
50, Statement showing Earned Surplus per Books, Period from Commencement of Operations to June 30, 1941	13212	4269
51, Statement showing Capital Surplus per Books, Period from September 1, 1930 to June 30, 1941	13214	4273
52, Statement showing Investment in Gas Plant as at each December 31, 1930 through 1940 and as at June 30, 1941	13215	4275
53, Statement of Dividends paid on Class A and Class B Preferred Stocks from beginning to September 1, 1941	13217	4279
54, Statement of Dividends paid on Common Stock from beginning to September 1, 1941	13219	4280
55, Statement showing Comparison of Sales and Revenue, Principal Industrial Customers, years 1939, 1940 and 1941	13220	4281
55-A, Statement showing Comparison of Sales and Revenue, Principal Industrial Customers, years 1939, 1940, and 1941	13221	4283
56, Statement of Gas Produced, Period from April 1, 1932 to June 30, 1941	13222	4284
57, Statement of Gas Purchased, Period from April 1, 1932 to June 30, 1941	13223	4285

	Original	Print
58, Statement of Gas Revenue, Period from April 1, 1932 to June 30, 1941 and Schedule showing Detail of Sales to various Types of Customers, 1939 and 1940	13224	4287
Schedule 1, Statement of Gas Revenue, Period from April 1, 1932 to June 30, 1941	13224	4287
Schedule 2, Detail of Sales to Gas Utilities, years 1939 and 1940	13225	4289
Schedule 3, Detail of Sales to Industrial Customers, years 1939 and 1940	13227	4293
59, Statement of Gas Revenue by States, Period from April 1, 1932 to December 31, 1941	13229	4297
60, Statement showing Sales Agreements with other Gas Companies as at June 30, 1941	13230	4299
61, Study of Current and Future Trends in Commodity Prices and Wages, by David Friday	13238	4310
Graph showing Wholesale Prices from 1800 to 1940	13239	4311
Index Numbers of Wholesale Prices of Commodities by Groups	13241	4313
Commodity Price Indexes of Ten Countries	13247	4318
Statement relating to Tax Collections in the United States, from 1913 to 1942	13258	4328

Pleas and proceedings in the United States Circuit Court of Appeals for the Eighth Circuit, at the May Term, 1944, of said Court, before the Honorable John B. Sanborn, the Honorable Joseph W. Woodrough and the Honorable Walter G. Riddick, Circuit Judges.

Attest:

E. E. KOCH,
Clerk of the United States Circuit Court of Appeals for the Eighth Circuit.

(Seal)

Be it Remembered that heretofore, to-wit: on the 6th day of February, A. D. 1943, a transcript of record on Petition to Review and Set Aside Order of Federal Power Commission was filed in the office of the Clerk of the United States Circuit Court of Appeals for the Eighth Circuit, in a certain matter wherein Panhandle Eastern Pipe Line Company, a Corporation, et al., were Petitioners, and the Federal Power Commission, et al., were Respondents, which said transcript as prepared and printed, pursuant to designations, under the rules of the United States Circuit Court of Appeals for the Eighth Circuit, under the supervision of its Clerk, is in the words and figures following, to-wit:

[fol. a] Petition of Panhandle Eastern Pipe Line Company, Illinois Natural Gas Company, and Michigan Gas Transmission Corporation to Review and Set Aside An Order of the Federal Power Commission.

(Filed in U. S. Circuit Court of Appeals on November 18, 1942.)

In the United States Circuit Court of Appeals for the Eighth Circuit.

Panhandle Eastern Pipe Line Company, a Corporation, Illinois Natural Gas Company, a Corporation, and Michigan Gas Transmission Corporation, a Corporation, Petitioners,

No. 12466. vs.

Federal Power Commission, City of Detroit, Michigan, County of Wayne, Michigan, Michigan Consolidated Gas Company, a Corporation, and Michigan Public Service Commission, Respondents.

To the United States Circuit Court of Appeals for the Eighth Circuit and the Honorable Judges Thereof:

Panhandle Eastern Pipe Line Company, a Delaware corporation (herein sometimes referred to as Panhandle Eastern), Illinois Natural Gas Company, an Illinois cor-
[fol. b] poration (herein sometimes referred to as Illinois Natural), and Michigan Gas Transmission Corporation, a Delaware corporation (herein sometimes referred to as Michigan Gas), herein collectively referred to as Petitioners, being aggrieved by an Order of the Federal Power Commission (herein sometimes referred to as the Commission) dated September 23, 1942, as amended October 12, 1942, respectfully petition this Honorable Court to review and set aside said Order.

In support of their petition they respectfully represent:

A.

The Nature of the Proceedings As to Which Review Is Sought.

(a) The Order of the Commission which Petitioners now seek to have reviewed and set aside was entered after a hearing in two consolidated proceedings brought against petitioners. These proceedings were entitled and docketed before the Commission as follows: "City of Detroit, Michigan, and County of Wayne, Michigan, vs. Panhandle Eastern Pipe Line Company and Michigan Gas Transmission Corporation, Docket No. G-200," and "In The Matter of Panhandle Eastern Pipe Line Company, Michigan Gas Transmission Corporation, and Illinois Natural Gas Company, Docket No. G-207."

The proceedings were instituted and the Order was made purportedly under the authority of and in accordance with the terms of an act of Congress known as The Natural Gas Act (Act of June 21, 1938, Ch. 556, 22 Stat. 824, Title 15, U. S. C. A. 717).

(b) Case No. G-200 was instituted February 28, 1941, by the filing of a complaint by the City of Detroit, Michigan, and the County of Wayne, Michigan, against Petitioners, Panhandle Eastern and Michigan Gas. In said complaint it was alleged that the rates and charges paid [fol. c] by Panhandle Eastern to Michigan Gas (which latter Company, for a carrying charge paid by Panhandle Eastern, transports gas from Panhandle Eastern's pipeline to its distributor customer, Michigan Consolidated Gas Company, and other customers) were excessive, and that the rates and charges demanded and collected by Panhandle Eastern from said Michigan Consolidated Gas Company were unjust, unreasonable and unduly discriminatory. The prayer of the complaint was that the Commission, after investigation, fix and determine the just and reasonable rates to be thereafter observed and enforced in respect to such transportation and sale of natural gas for resale in said city of Detroit and in said County of Wayne.

Answers were filed by Michigan Gas on March 28, 1941, and by Panhandle Eastern on April 3, 1941, in which it

was denied that the rates complained of were excessive, unjust, unreasonable or discriminatory. Permission to intervene in said proceeding was granted to Michigan Public Service Commission (a State regulatory body having jurisdiction of the rates of Michigan Consolidated and other Michigan utilities) on June 10, 1941, and to Michigan Consolidated on July 12, 1941.

(c) Docket No. G-207 was a proceeding instituted by the Commission on its own motion against Panhandle Eastern and Michigan Gas by way of an investigation for the purpose of enabling the Commission

(1)

To determine with respect to each of said companies (a) whether it is a natural gas company within the meaning of the Natural Gas Act, and (b) whether in connection with any transportation or sale of natural gas subject to the jurisdiction of the Commission, any rates, charges or classifications demanded, observed, charged or collected, or any contracts affecting such rates, charges, or classifications, are unjust, unreasonable, unduly discriminatory or preferential; and

[fol. d] (2)

If the Commission, after hearing, should find that Panhandle Eastern or Michigan Gas is a natural gas company within the meaning of the Natural Gas Act, and that any of their rates, charges, classifications, rules, regulations, practices or contracts, subject to the jurisdiction of the Commission, are unjust, unreasonable, unduly discriminatory or preferential, to determine and fix by appropriate order or orders, just and reasonable rates, charges, classifications, rules, regulations, practices or contracts to be thereafter observed and in force.

On March 26, 1942, during the hearings hereinafter referred to, Illinois Natural was, by agreement, made party to the proceedings in Docket G-207.

(d) On July 15, 1941, hearings were commenced under Docket No. G-200 before Hon. Samuel H. Crosby, Trial Examiner for the Commission. During those hearings, on September 2, 1941, Dockets Nos. G-200 and G-207 were

consolidated, and thereafter the hearings continued in the consolidated causes from time to time, until April 23, 1942. These hearings occupied eighty-four hearing days, during which oral testimony (comprising 10,774 pages), two hundred sixty-seven exhibits, and other documentary evidence were introduced.

(e) On April 23, 1942, motions were filed by Commission Counsel, and by Counsel for the City of Detroit, the County of Wayne, and Intervener, Michigan Consolidated, seeking an immediate or interim order of the Commission directing a reduction of Petitioners' rates pending further hearings and investigation. Upon such motions being filed, the examiner adjourned the hearings and directed the filing by all parties of briefs, addressed to such motions. Briefs of all parties were filed on or prior to June 1, 1942.

(f) On September 28th, 1942, the Commission served on your petitioners its final interim rate order in said con- [fol. e) solidated dockets, but keeping the record in said causes open for such further proceedings as the Commission may deem necessary or advisable. Said order bears the date September 23, 1942, and was issued pursuant to its Opinion No. 80. A copy of such Opinion No. 80 and the order issued pursuant thereto is hereto attached, marked Exhibit A, and by reference made a part hereof.

In said Order the Commission, without a specific finding as to the reasonableness of any specific rate, but solely because it found that Petitioners' net earnings during 1941 exceeded a 6½% return on the rate base found by it to be reasonable, purported to find Petitioners' rates and charges in connection with their transportation and sale of natural gas in interstate commerce for ultimate public consumption to be unjust, unreasonable and excessive, and directed that Petitioners' rates and charges for or in connection with their transportation and sale of natural gas in interstate commerce for resale for ultimate public consumption be so reduced as to reflect, when applied to their 1941 transportation and sales, a reduction of $5,094,384 per annum below their 1941 consolidated gross operating revenues of $17,789,573.

Said Order further required that on or before October 15, 1942, Petitioners file new schedules of rates and charges

for or in connection with their transportation and sale of natural gas in interstate commerce for resale for ultimate public consumption which shall reflect such reduction of $5,094,384 below 1941 consolidated gross operating revenues; and that such new schedules of rates and charges shall be effective as to all bills regularly rendered on or after November 1, 1942.

On October 12, 1942, the Commission issued its order extending the time for filing new schedules of rates and charges required by said Order of September 23, 1942, to be filed by October 15, 1942, to November 10, 1942; but provided therein that such extension of time should not operate as a change of the date on which the new schedule of rates and charges should be effective, namely, Novem- [fol. f] ber 1, 1942, and that nothing in said order should be construed as staying the time within which Petitioners shall file a petition for rehearing or a petition for review as provided in Section 19 of the Natural Gas Act. A copy of said Order is attached hereto, marked Exhibit B, and by reference made a part hereof.

(g) Within thirty days from the date of said Opinion No. 80 and the order of the Commission issued pursuant thereto, to-wit, on October 23, 1942, Petitioners did file with the Commission, in strict accord with the rules of the Commission and Section 19 of the Natural Gas Act, their joint Petition for Rehearing and Reconsideration by the Commission of its said order of September 23, 1942, issued pursuant to said Opinion No. 80. In that petition complaint is made of certain rulings by the Commission's Examiner in the course of the hearing of evidence, and to certain rulings, holdings and findings in the memorandum opinion upon which said order is based, and in the order itself; and complaint is also made of the failure of the Commission in said order to make certain rulings, holdings and findings. The rulings, holdings and findings concerning which complaint is made are set out in Specifications of Error incorporated in said petition.

(h) On October 30, 1942, the Commission denied your Petitioners' Petition for Rehearing and Reconsideration. Petitioners have, therefore, exhausted all their administrative and procedural remedies before the Commission.

B.

The Facts and Statute Upon Which Venue Is Based.

(a) The statute upon which venue and jurisdiction in this case is based is Section 19(b) of the Natural Gas Act; Act of June 21, 1938, Ch. 556, 52 Stat. 833; Title 15, U. S. C. A., Section 717 r (b), the pertinent part of which reads:

[fol. g] "Any party to a proceeding under this chapter aggrieved by an order issued by the Commission in such proceeding may obtain a review of such order in the circuit court of appeals of the United States for any circuit wherein the natural-gas company to which the order relates is located or has its principal place of business. * * *"

(b) Panhandle Eastern is a corporation organized and existing under the laws of the State of Delaware, Illinois Natural is a corporation organized and existing under the laws of the State of Illinois, and Michigan Gas is a corporation organized and existing under the laws of the State of Delaware. Each of petitioners is a natural-gas company within the contemplation of said Natural Gas Act. Illinois Natural and Michigan Gas are both wholly owned subsidiaries of Panhandle Eastern. Each of Petitioners has its principal place of business in Kansas City, Jackson County, Missouri, within the jurisdiction of the Eighth Circuit Court of Appeals. Petitioners together constitute a pipeline production transmission and marketing system owning large gas reserves in the states of Texas, Oklahoma, and Kansas, and a pipeline with appropriate lateral lines connecting those reserves with markets in Texas, Kansas, Missouri, Illinois, Indiana, Ohio, and Michigan. A substantial portion of the transmission facilities lie within the territory over which this Court has jurisdiction.

C.

The Points on Which the Petitioners Intend to Rely.

In this Review proceeding, Petitioners intend to rely upon each and all of the Points hereinafter set forth, all of which were urged by Petitioners as specifications of error in their Petition for Rehearing filed with the Commission.

To avoid unnecessary repetition, Petitioners assert that each of the errors hereinafter specifically assigned under [fol. h] the following Points operates to confiscate and take Petitioners' property without just compensation, and to deprive Petitioners of such property without due process of law; contrary to the Fifth Amendment to the Constitution of the United States; that none of the Findings and Conclusions challenged is based upon substantial evidence as required by the Natural Gas Act, and each is contrary to the evidence; and that because of the errors complained of in said respective Points, Petitioners have not been given such a fair hearing as is contemplated by the Natural Gas Act and the provisions of the Fifth Amendment to the Constitution of the United States; and, by virtue of such errors, the Commission's order, as applied to the facts before it and viewed in its entirety, produces an arbitrary result.

First Point.

The Examiner for the Commission erred in refusing to admit in evidence Exhibits 39, 39-A, 62, 83 and 84, showing the reproduction cost of Petitioners' physical properties and the present value of such properties as evidenced by the reproduction cost new of such properties less observed depreciation thereof; such evidence being admissible for consideration in determining both the fair value of such properties and the return to which Petitioners are justly and [reasonable] entitled.

Second Point.

The Examiner for the Commission erred in refusing to admit in evidence Exhibit 71 and Pages 17, 20, 21, 22 and 32, of Exhibit 75, showing the value of the properties of Panhandle Eastern at the approximate date of the enactment of the Natural Gas Act; such value, when considered in connection with subsequent additions and allowances for depreciation being appropriate for consideration by the Commission in determining both the fair value of Petitioners' properties and the return to which Petitioners are justly and reasonably entitled.

[fol. i] Third Point.

The Examiner for the Commission erred in refusing to admit in evidence Exhibits 37 and 37-A, and the testimony

explanatory thereof, showing the present value of the gas leasehold estates owned by Panhandle Eastern, based on the prices at which said gas leaseholds could now be sold, whether the production therefrom be sold by the purchaser in a regulated or in an unregulated market; such evidence being appropriate for consideration by the Commission in determining both the fair value of Petitioners' properties and the return to which Petitioners are justly and reasonably entitled.

Fourth Point.

The Commission erred in refusing to include in the rate base the value of the property represented by "Construction Work in Progress" on December 31, 1941, February 28, 1942, or March 31, 1942, the evidence clearly showing that the property reflected in such accounts represented actual cost to Petitioners as of those respective dates.

Fifth Point.

The Commission erred in refusing to include in the rate base Petitioners' property represented by the increase in "Gas Plant Classified" from December 31, 1941, to March 31, 1942, since such increase represented actual cost to Petitioners.

Sixth Point.

The Commission erred in refusing to include in the rate base the property represented by additional capital expenditures which, at the time hearings were suspended, were covered by current budgets, were in course of construction, and expected to be completed by the end of 1942, since the evidence clearly showed that the expenditures would be made, and that funds were on hand to make the required payments.

[fol. j] Seventh Point.

The Commission erred in failing to consider, in determining either the rate base or the appropriate return, the cost of carrying unused capacity until its use was required, since it was not shown that during the period 1932 to 1937 the earnings of Petitioner Panhandle Eastern constituted a reasonable return on its invested capital or that such cost was thereafter recouped from excessive earnings.

Eighth Point.

The Commission erred in finding that the failure of Petitioner Panhandle Eastern fully to utilize its capacity during the development period 1932 to 1937 was because of the restraint of its holding company because

(1). There is no evidence of probative value sufficient to justify the finding.

(2) The amount of revenues, if any, lost to the company, as a result of such restraint, if any there was, is not made to appear.

(3) There is no evidence to support the finding that customers along the line were clamoring for service.

Ninth Point.

The Commission erred in refusing to include in the rate base the unamortized portion ($251,505) of the item of $654,989 included in "old gas sales and purchase contracts" which concededly reflects cost to Panhandle Eastern.

Tenth Point.

The Commission erred in refusing to accept as the rate base Petitioners' "Prudent Investment" represented by its invested capital, adjusted by a reduction therefrom of the unamortized portion of the item representing the contracts acquired by Panhandle Eastern from Missouri [fol. k] Kansas Pipe Line Company, originally for $2,398,402, the only item reflected in the invested capital as to which any question has been raised relating to cost to Panhandle Eastern.

Eleventh Point.

The Commission erred in failing to adopt at least Petitioners' Invested Capital (less the unamortized portion of the old gas sales and purchase contracts) as of March 31, 1942, in the sum of $76,563,961, as the appropriate rate basis and the cost of service thereof, $5,173,686 as the return to which Petitioners are entitled—a "rate of return" of 6.75% on the invested capital.

Twelfth Point.

The Commission erred in failing to adopt at least Petitioners' Pro Forma Invested Capital (less the unamor-

tized portion of the old gas sales and purchase contracts) as of December 31, 1941, in the sum of $75,738,202, as the rate base, and the cost of service thereof, $5,074,292, as the return to which Petitioners are entitled—a rate of return of 6.69% on such invested capital.

Thirteenth Point.

The Commission erred in finding that 6½% is a fair return upon the rate base allowed because there is no evidence of probative value to support that finding.

Fourteenth Point.

The Commission erred in finding that $4,363,925 constitutes a reasonable return to Petitioners because there is no evidence of probative value showing that such amount is a fair and reasonable return on either Petitioners' invested capital, or the fair value of their property.

[fol. 1] Fifteenth Point.

The Commission erred in finding that $4,363,925 constitutes a reasonable return to Petitioners since there is no evidence of probative value showing that such sum reflects the "cost of service" as that term is used in applying the prudent investment doctrine of regulation, no evidence of probative value that such sum will be adequate to attract capital to the enterprise, or be adequate to enable Petitioners to maintain and support their credit, and enable them to raise the money necessary for the discharge of their public duties; and such finding is against the uncontradicted evidence showing that such sum will not be adequate for those purposes.

Sixteenth Point.

The Commission erred in using Petitioners' 1941 experience as a test period without

(a) Adjusting same so as to deduct from receipts the amounts received ($980,000) from increased sales to purchasers engaged in war work, such sales not being normal.

(b) Increasing operating expenses in the sum of $73,500 resulting from payroll increases not incident to increases in revenues, required in 1942 and subsequent years, and not fully reflected in 1941 operating expenses.

(c) Increasing operating expenses by the sum of $221,500, not fully reflected in 1941 operating expenses, required for emergency property protection as a result of the war (which emergency expense should be considered if the abnormal receipts are considered).

(d) Increasing operating expenses by the sum of $30,000 representing increased cost of Employees' Welfare and Pension Expense resulting from the employees of Michigan Gas becoming employees of the Panhandle Eastern System, and thereby being entitled to participate in such benefits.

[fol. m] (e) Increasing operating expenses by the sum of $70,000 representing a reasonable annual charge for amortizing in five years the expense of the proceedings.

(f) Increasing operating expenses by the sum of $.... so as to take care of increased Federal Income Excess Profits Taxes required by the 1942 Act.

Seventeenth Point.

The Commission erred in the assumption that future increases in net revenues will equal the increases in expenses since there is no evidence of probative value to sustain such assumption.

Eighteenth Point.

The Commission erred in taking into consideration the possibility that Petitioners' lines may for a time be operated at a 90% capacity factor without also taking into consideration the additional capital expenditures which will be required to permit such operation more than a few months, and the increased unit production cost resulting therefrom.

Nineteenth Point.

The Commission erred in holding that increased tax burdens must be borne by a regulated utility, and are not to be allowed for in the fixing of Petitioners' rates.

Twentieth Point.

The Commission erred in failing reasonably to allocate Petitioners' earnings between regulated and unregulated sales, and in taking Petitioners' direct sales into consid-

eration in determining the amounts of Petitioners' profits, and then directing that the excess return so determined be reduced through a reduction of the prices and charges for gas sold for resale; thereby assuming jurisdiction over Petitioners' direct sales.

[fol. n] Twenty First Point.

The Commission erred in requiring a reduction of Petitioners' rates and charges so as to reflect, when applied to their 1941 transportation and sales, a reduction of not less than $5,094,384 below their 1941 consolidated gross operating revenue; thus taking from Petitioners a large portion of their required cost of service.

D.

The record in this case, as already shown, contains 10,774 pages and two hundred sixty-seven Exhibits, some of which are rather lengthy. Counsel for Petitioners are now preparing a narrative statement of the record, and it may be possible for the parties to stipulate as to the corrections thereof, and as to what portions of the transcript or the narrative should be printed. Whether such stipulation is reached or not, it will not be reasonably feasible for Petitioners after the filing of the transcript in this Court, within the time required by the rules of this Court, to prepare and serve upon all other parties and file with the Court a designation of the portions of the transcript to be contained in the printed record, and a reasonable time should be allowed for such designation and service and filing thereof.

Wherefore, Petitioners pray:

1. That a copy of this Petition forthwith be served upon some member of Respondent, Federal Power Commission, in pursuance of Section 19 (b) of the Natural Gas Act (Act of June 21, 1938, Ch. 556, 52 Stat. 833; Section 717 r. (b), Title 15, U. S. C. A.), and that all parties respondent herein be served with a copy of said Petition, as provided by the Rules of this Court.

2. That Respondent, Federal Power Commission, be required, in conformity with said Act, to certify and file with the Court a transcript of the record upon which the Order now sought to be reviewed was entered, including

[fol. o] the testimony, evidence, exhibits, pleadings, opinions, findings, conclusions and orders of said Respondent in the two dockets above referred to.

3. That pursuant to the rules of this Court Petitioners be notified by the Clerk when said transcript has been received and that an order be entered herein allowing Petitioners a reasonable time from the date of such notice within which to prepare the portion of the transcript to be contained in the printed record, unless, in the meantime, the parties have stipulated as to what portions of the transcript shall be printed.

4. That this Court review the Order of the Respondent, Federal Power Commission, of September 23, 1942, and the findings and opinion of the Commission upon which the same is based and which are incorporated therein, as supplemented by the order of said Commission dated October 12, 1942, and the order of the Commission denying Petitioners' Petition for Rehearing filed with the Commission, and upon such review reverse, vacate, set aside, and hold said Order for naught.

5. That this Court exercise its jurisdiction over the parties and subject matter of this Petition and grant to Petitioners such other and further relief in the premises as the rights and equities of the cause may require.

PANHANDLE EASTERN PIPE LINE COMPANY,

ILLINOIS NATURAL GAS COMPANY,

MICHIGAN GAS TRANSMISSION CORPORATION,

Opinion

Scott, Commissioner:

The issues now before us in these proceedings are raised by motions for an immediate order reducing natural gas rates pending further investigation.

On February 28, 1941, the City of Detroit and the County of Wayne, Michigan, filed a petition with this Commission alleging that the rates and charges of Panhandle Eastern Pipe Line Company[1] and Michigan Gas Transmission Corporation[2] for natural gas sold to Michigan Consolidated Gas Company[3] for resale in that city and county are unjust, unreasonable and unduly discriminatory. On May 22, 1941, the Commission, on its own motion, instituted an investigation of all the interstate wholesale natural gas rates and charges of Panhandle Eastern and Michigan Gas. The two proceedings were consolidated for purposes of hearing. The Michigan Public Service Commission and

[1]Hereinafter referred to as "Panhandle Eastern."

[2]Hereinafter referred to as "Michigan Gas."

[3]Hereinafter referred to as "Michigan Consolidated."

Michigan Consolidated were permitted to intervene. On March 26, 1942, the Commission enlarged the investigation [fol. s] to include the Illinois Natural Gas Company.[4]

Hearings were begun on July 15, 1941, and continued thereafter from time to time through 84 days until April 23, 1942, when our Trial Examiner adjourned the hearings pending disposition by the Commission of the pending motions for an immediate order reducing rates filed by the Complainants, Michigan Consolidated and counsel for this Commission. The record comprises 10,774 pages of transcript of the proceedings and 267 exhibits, consisting largely of the respondents'[5] presentation on direct, cross-examination thereon, and rebuttal evidence.

The complainants offered one witness in support of their petition. The respondents offered 24 witnesses who presented a complete rate case including, among other matters, evidence of operations, revenues, expenses, book cost and original cost of their properties, "going concern value," working capital, gas reserves, depreciation, rate of return, future capital expenditures and allocation of costs. Counsel for the Commission called 5 witnesses whose testimony related principally to depreciation, a write-up, historical earnings on average net investment, working capital, rate of return, and allocation of costs. The interveners presented no witnesses. The witnesses were tendered to all parties for cross-examination and full opportunity was given to present rebuttal evidence. Exhaustive briefs have been filed by the parties fully arguing the issues raised by the motions.

The complainants contend that the respondents' rates should immediately be reduced by $6,800,479 per annum; Commission counsel seeks a reduction of [a] least $5,580,887; and Michigan Consolidated urges a reduction of $5,489,874. The respondents deny that their rates and charges are unjust and contend that the motions should be denied.

[fol. t] Jurisdiction.

No question has been raised concerning the Commission's jurisdiction over the respondents' rates and charges

[4]Hereinafter referred to as "Illinois Natural."

[5]Panhandle Eastern, Michigan Gas and Illinois Natural are hereinafter sometimes referred to collectively as the "respondents."

for the transportation and sale in interstate commerce of natural gas for resale, and the respondents admit that they are "natural-gas companies" within the purview of the Natural Gas Act.

Authority for Interim Order.

It has been clearly established by the Supreme Court of the United States in the Natural Gas Pipeline Company of America case[6] that this Commission may, upon a proper record, enter an interim order in rate proceedings under the Natural Gas Act.

In the instant proceedings respondents have been given full opportunity to present all the evidence they desired, to adduce, and to cross-examine the witnesses offered by the complainants and Commission's counsel. Indeed, respondents' counsel stated at the conclusion of all the testimony now contained in the record that they had no further evidence to offer, and that they had not been denied the opportunity to present additional testimony. In their brief, respondents' counsel state that full and complete evidence has been presented dealing with those elements which this Commission has heretofore deemed appropriate for consideration in proceedings such as these. The record is voluminous and comprehensive, touching those matters usually deemed relevant in the rate-making process. It cannot be gainsaid that the respondents have had a full and complete hearing. Thus, it appears that the record is ripe for a determination of the substantive aspects of the problem posed by the motions.

[fol. u] Ownership, Control and Description of Respondents' System.

The respondent, Panhandle Eastern, a Delaware Corporation, has outstanding 807,367 shares of common stock owned beneficially as follows: 404,326 shares (50.1%) by Columbia Oil & Gasoline Corporation, a subsidiary of Columbia Gas & Electric Corporation; 339,475 shares (42%) by Missouri-Kansas Pipe Line Company; and 63,566 shares

[6]Federal Power Commission, et al., vs. Natural Gas Pipeline Company of America, et al., 315 U. S. .....; 62 S. Ct. 736.

by the public. All the outstanding securities of respondent, Michigan Gas, a Delaware corporation, and respondent, Illinois Natural, an Illinois corporation, are owned by Panhandle Eastern. The respondents are operated as a single system for the production, gathering, transportation and sale in interstate commerce of natural gas, principally for resale, and it is not controverted that the separate corporate entities may be disregarded.

Panhandle Eastern produces, purchases and gathers natural gas in the Amarillo field of the Texas Panhandle and in the Hugoton field in southwestern Kansas. This gas is transported to markets along Panhandle Eastern's main transmission line which extends for a distance of about 860 miles from a point in Moore County, in the Texas Panhandle, through the States of Oklahoma, Kansas, Missouri and Illinois, to a point near Dana, Indiana, adjacent to the Illinois-Indiana boundary. At this point, gas is delivered into the main transmission line of Michigan Gas, which extends from Dana, Indiana, to a point near Zionsville, Indiana, where the line branches to Detroit, Michigan, and to Muncie, Indiana. Through these facilities of Michigan Gas, the gas is marketed in Indiana, Ohio, and Michigan. Illinois Natural owns numerous lateral lines extending from Panhandle Eastern's main line in Illinois, and serves numerous customers in that State. Panhandle Eastern also owns a small section of pipe line, recently acquired from The Ohio Fuel Gas Company, connected to the lines of Michigan Gas and used to serve certain com- [fol. v] munities in Indiana and Ohio. Together, these lines constitute the longest natural-gas pipe line in the world, serving more than 200 cities, towns and communities with more than 700,000 retail customers in Texas, Kansas, Missouri, Illinois, Indiana, Michigan and Ohio.

The Rate Base.

Evidence of Reproduction Cost Excluded. The record before us raises the question of the necessity, under the Natural Gas Act, for considering evidence of the reproduction cost of respondents' property. Upon objection of Commission counsel, such evidence was excluded by the Trial Examiner.

Section 6(a) of the Natural Gas Act provides:

"Sec. 6(a) The Commission may investigate and ascertain the actual legitimate cost of the property of every natural-gas company, the depreciation therein, and, when found necessary for rate-making purposes, other facts which bear on the determination of such cost or depreciation and the fair value of such property."

It is obvious from an examination of the record that there is no need to estimate the cost of the respondents' properties. The cost records are complete and maintained in accordance with recognized accounting practice. The respondents assert that their books accurately reflect the original cost of the properties. The plant has been built within recent years, construction having begun in 1930.[7] [fol. w] There is, therefore, no difficulty whatever in ascertaining promptly and accurately from respondents' books the actual legitimate cost of or the investment in their property.

We held in the Chicago District Electric Generating case[8] that under Section 208(a) of the Federal Power Act (the provisions of which are identical with Section 6(a), supra) that reproduction cost evidence is inherently fallacious and should be disregarded under that statute.

It is not deemed necessary to discuss at great length the defects and vagaries of reproduction cost evidence. The manifold reasons why such evidence is fallacious, and is

---

[7]The books show the gas plant classified of Panhandle Eastern and Illinois Natural, combined, at the end of each of the years 1930-1941 as:

1930	$ 7,571,851	1936	$46,387,074
1931	41,815,781	1937	58,071,907
1932	42,568,283	1938	58,751,335
1933	42,435,049	1939	59,226,065
1934	42,594,692	1940	64,380,428
1935	42,441,201	1941	65,225,927

and of Michigan Gas as:

1931	$ 2,340,353	1937	$ 9,226,241
1932	2,354,167	1938	9,260,047
1933	2,353,183	1939	9,812,436
1934	2,357,450	1940	12,295,897
1935	2,397,880	1941	12,804,341
1936	7,770,429		

[8]Re Chicago District Electric Generating Corp., 39 PUR (N. S.) 263.

obstructive of the regulatory process, have been fully expounded by members of the Supreme Court[9] and by this Commission.[10]

[fol. x] Moreover, in the light of the many expressions emanating from the highest court in the land, and the opinions of competent experts in the regulatory field, it seems evident that Congress recognized the fallacy of the reproduction cost doctrine and sought by the enactment of Section 6(a) to shelve that illusory concept as a requisite in rate making. Our view, that this was uppermost in the mind of Congress, is substantially concurred in by the Special Committee of the Public Utility Law Section of the American Bar Association in its report at the annual meeting of such association in September, 1940.[11] No less significant in this respect is the statement of the Supreme Court in the Natural Gas Pipeline Company of America case that:

"The Constitution does not bind rate-making bodies to the service of any single formula or combination of formulas. Agencies to whom this legislative power has been

[9]See concurring opinion of Justice Black, Douglas and Murphy in Federal Power Commission, et al. vs. Natural Gas Pipeline Company of America, et al., 315 U. S. ....; 62 St. Ct. 736. Mr. Justice Black dissenting in McCart vs. Indianapolis Water Co., 302 U. S. 419, 435. Concurring opinion of Mr. Justice Frankfurter and Mr. Justice Black in Driscoll vs. Edison Co., 307 U. S. 104, 122. Dissenting opinion of Mr. Justice Brandeis in State of Missouri ex rel Southwestern Bell Telephone Co. vs. Public Service Commission of Missouri, et al., 262 U. S. 276, 292. Mr. Justice Brandeis concurring in St. Joseph Stockyards Co. vs. U. S., 298 U. S. 38, 88-92.

[10]Re Chicago District Electric Generating Corp. case, supra; Re Canadian River Gas Co., et al., FPC Op. 73; Re Hope Natural Gas Co., FPC Op. 76; see brief for the United States Amicus Curiae, in which this Commission joined, case of Driscoll vs. Edison, 307 U. S. 104.

[11]This Committee in discussing Section 208 of the Federal Power Act and Section 6 of the Natural Gas Act concluded:

"It will be noted that the primary duty of the Commission under these two provisions is to ascertain the cost of the property and the depreciation thereon, and that 'other facts which bear on the determination of such cost or depreciation, and the fair value of such property' are to be determined only 'when found necessary for rate making purposes.' There is here the possible inference that the Congress, when it drafted this provision, was hopeful that the courts would decide that nothing other than the 'actual legitimate cost' of the property would be found necessary for rate making purposes.' However that may be it is patent that an accounting or cost rate base was dominant in the Congressional mind, and that these very recent statutes in that respect are the very antithesis of some of the older state statutes which prescribe the reproduction cost new less depreciation formula."

delegated are free, within the ambit of their statutory authority, to make the pragmatic adjustments which may be called for by particular circumstances."

[fol. y] When such pronouncement is coupled with the assertion, in the separate concurring opinion, of Justices Black, Douglas and Murphy that:

"As we read the opinion of the Court, the Commission is now freed from the compulsion of admitting evidence on reproduction cost or of giving any weight to that element of 'fair value.' The Commission may now adopt, if it chooses, prudent investment as a rate base—the base long advocated by Mr. Justice Brandeis. And for the reasons stated by Mr. Justice Brandeis in the Southwestern Bell Telephone case there could be no constitutional objection if the Commission adhered to that formula and rejected all others"

any thought that reproduction cost evidence is any longer required in the rate-making process is substantially destroyed.

Having been authorized by the Congress to determine in the first instance the actual legitimate cost of utility properties and the depreciation therein, we conclude that the rate base is the actual legitimate cost of the property used and useful in furnishing the service, less the existing depreciation in such property, plus the working capital necessary to render such service. It is certain from the record that no necessity exists requiring the consideration of other facts in determining a rate base in these proceedings. It is, therefore, clear that the exclusion of reproduction cost evidence by the Trial Examiner was proper.

The Actual Legitimate Cost. The record clearly shows that the consolidated book cost of the plant in service at December 31, 1941, is $79,986,407.[12] Respondents take the

[12]This gives effect to the acquisition by Panhandle Eastern on February 6, 1942, of Michigan Gas, Indiana Gas Distribution Corporation, and a section of pipe line purchased from The Ohio Fuel Gas Company. It also gives effect to the following deductions:

(a) $139,500 of inter-company profit eliminated by the respondents on their consolidated statements, but not recorded on the books, and (b) $55,016 of "contributions in aid of construction."

Indiana Gas Distribution Corporation, hereinafter referred to as "Indiana Gas," a wholly-owned subsidiary of Panhandle Eastern, owns

position that their book cost and the actual legitimate cost [fol. z] are identical. The movants, for purposes of their motions, have accepted this sum as the actual cost of the properties, except for an item of $1,172,115, the unamortized amount of "gas sales and purchase contracts," alleged to be a write-up.

The evidence shows that the partnership firm of Shippey, Maddin and Parish Gas Company originally secured these contracts at no cost, and thereafter transferred the same to its subsidiary, Missouri-Kansas Pipe Line Company, which company recorded them on its books at a purported value of $1,105,000. On October 23, 1930, Panhandle Eastern acquired these contracts from Missouri-Kansas Pipe Line Company, then its parent, and recorded the same on its books at $2,398,402. By December 31, 1941, this amount had been reduced through annual amortization charges to $1,172,115. Since the record discloses that this unamortized balance of "gas sales and purchase contracts" represents a write-up (no property used and useful), it must be excluded in arriving at the actual legitimate cost of plant.

Panhandle Eastern is currently amortizing this write-up through charges to operating expenses at the rate of $293,029 per year. Inasmuch as this write-up, if allowed, [fol. aa] would impose an unwarranted burden on the consumers, it is accordingly excluded from operating expenses.

The elimination from book cost of the said write-up of $1,172,115 leaves $78,814,292, which is accepted, for purposes of disposing of the problems presented by the motions before us, as the actual legitimate cost of the respond-

---

and operates certain facilities in Indiana through which it serves approximately 1,800 customers with natural gas purchased from either Michigan Gas or Panhandle Eastern. Although the distribution facilities of this company are not subject to the jurisdiction of this Commission, it is undisputed that its properties, receipts and expenses are inconsequential in comparison with the whole of the respondents' system, and the parties have treated the same as an integral part of the respondents' interstate operations. We shall therefore include the operations of Indiana Gas as a part of the respondents' interstate business for purposes of disposing of the motions before us.

ents' property used and useful in furnishing gas service at December 31, 1941, as shown by the following tabulation:

Panhandle Eastern	$ 62,665,568
Illinois Natural	2,871,194
Michigan Gas	12,643,847
Indiana Gas	194,357
Pipe Line Purchased from Ohio Fuel Gas Co.	439,326
Total	$ 78,814,292

Depreciation.[13] The respondents charge amounts for depreciation to operating expense and credit the same to depreciation reserves at the rate of approximately 3% per year on a straight-line basis. As shown by the respondents' books, the depreciation expense in 1941 was $2,512,498, and the total accumulated depreciation reserves at December 31, 1941, was $12,596,987. The Commission's staff recommends that for purposes of determining the rates to be fixed by interim order these amounts be accepted as the annual depreciation allowance and accrued depreciation respectively. The respondents agree that the books reserves should be accepted for purposes of these proceedings as the appropriate measure of the accrued depreciation. They do not deny that the annual depreciation expense as recorded on the books has been adequate and reasonable. The depreciation reserves, as of December 31, 1941, were as follows:

[fol. bb]	Panhandle Eastern	$ 10,405,047
	Illinois Natural	502,976
	Michigan Gas	1,661,966[14]
	Indiana Gas	26,998
	Total	$ 12,596,987

Where reasonable and proper depreciation accounting practices have been observed, the resulting reserve represents the best measure of the depreciation existing in the property and should be deducted from the gross cost in the rate base determination.[15] The record discloses that

[13]The term "depreciation" as herein used includes depletion and amortization.

[14]Reflects a deduction on $36,000 of inter-company profit eliminated by the respondents on their consolidated statements, but not recorded on the books.

[15]Re Hope Natural Gas Co., FPC Op. 76; Re Chicago District Electric Generating Corp., 39 PUR (N. S.) 263, 275; Re Interstate Power Co., 32 PUR (N. S.) 1, 10.

the respondents have followed a consistent accounting method in recording the annual and accrued depreciation. The amounts have been determined by the management after consultation with an independent engineer and geologist as to the propriety and reasonableness of the annual provisions and the reserves. The testimony of the Commission's staff is to the effect that the amounts which the respondents have set up on their books are adequate and reasonable, having in view the economic life of the property as governed by such elements of depreciation as the exhaustion of the natural gas supply, wear, decay, inadequacy and obsolescence. There is no dispute that these amounts have been sufficient to provide for the restoration of the capital investment over the life of the gas supply.[16]

[fol. cc] The respondents, complainants, and Michigan Consolidated presented separate estimates of depreciation expense consisting of a combination amortization and annual replacement allowance. Under these estimates, the amortization allowance is accumulated at various sinking fund interest rates, but the replacement allowance is not calculated on a sinking fund basis. There is sharp disagreement both as to the sinking fund formula to be used in computing the amortization and as to the amount to be allowed for replacements. These differences lead to widely varying results.

No sufficient reasons have been advanced why these estimates are to be preferred to the amounts recorded on the respondents' books. For the purpose of disposing of the motions before us, we shall accept the respondents' recorded depreciation expense of $2,512,498 as the reasonable annual allowance for depreciation, and the total accumulated depreciation reserves of $12,596,987 as the actual existing depreciation in the plant as of December 31, 1941.

---

[16]The respondents presented evidence indicating that Panhandle Eastern controls recoverable gas reserves of not less than 700 billion cubic feet in the Texas Panhandle field, and not less than 1,700 billion cubic feet in the Hugoton field, combined gas reserves adequate to supply the respondents' estimated market requirements for a period of more than 25 years. In fact, Panhandle Eastern's president testified that sufficient additional gas reserves could be secured on a favorable and economical basis to meet future requirements for the next 30 to 35 years.

Working Capital. The respondents claim the following amounts for working capital:

Cash for operating expenses	$ 517,175
Cash for emergencies	100,000
Minimum bank balances	316,303
Prepayments	134,538
Materials and supplies	735,724
Line pack	65,407
Total	$1,869,147

The Commission's staff recommends a total working capital allowance of $920,000. This sum includes for the respondents $322,701 of cash for operation and maintenance expenses, $489,893 for materials and supplies, $101,097 for prepayments, and $6,309 to provide working capital for Indiana Gas.

[fol. dd] We find the staff's estimated cash allowance for operation and maintenance expense of $322,701 to be proper and reasonable. This sum is equal to 45 days of the actual total 1941 operation and maintenance expense of the respondents, excluding cost of gas purchased. The respondents' higher claim for this item is primarily due to the improper inclusion of Panhandle Eastern's cost of gas purchased. It is clear from the evidence that the respondents pay for such gas at about the same time in each month as revenues from gas sales are collected. Hence, no allowance should be included in working capital for the cost of such gas.

We accept the staff's recommendation of $489,893 for materials and supplies. This amount represents the actual inventory on hand at December 31, 1941, the largest in the respondents' operating history. The respondents' higher claim is occasioned by the inclusion for Panhandle Eastern, in addition to the inventory as of June 30, 1941, of materials and supplies then on order and estimated to be ordered during the ensuing six months, without any deduction for materials and supplies issued and used during that period. The exorbitance of the respondents' estimate is demonstrated by the fact that it exceeds by at least $260,000 the materials and supplies actually on hand at December 31, 1941.

The staff's allowance of $101,097 for prepayments, representing the actual amount of such items as of December 31, 1941, is considered ample.

The evidence of record convinces us that $920,000 is a fair and reasonable amount for working capital and the same is allowed.

We make no separate allowance for the items of line pack, cash for emergencies, and minimum bank balances. To do so would result in duplication. The evidence discloses that Panhandle Eastern has capitalized in its plant accounts amounts for line pack in excess of the sum separately claimed for that item as working capital. The amounts accrued by the respondents for Federal, State [fol. ee] and local taxes are more than sufficient to cover the cash required for emergencies and minimum bank balances. Panhandle Eastern alone had approximately $3,000,000 in tax accruals at all times during the year 1941. Michigan Gas had accrued $268,385 for Federal income taxes and $114,000 for Indiana property taxes at December 31, 1941. We have consistently recognized that such tax accruals are available as cash working capital.[17]

Going Concern Value. We reject the respondents' claim for going concern value of $7,822,533. $5,500,000 of this amount is for so-called "carrying costs on that portion of plant idle, pending development of business," the same species of going concern value disallowed in the Natural Gas Pipeline Company of America case, supra. The said sum of $5,500,000 consists of a portion of the operating expenses, bond interest and ad valorem taxes incurred from the beginning of Panhandle Eastern's commercial operations on April 1, 1932, to October 1, 1937, all of which has been recouped through past rates and charges. It appears from the evidence that the failure of Panhandle Eastern to attain sales capacity during this so-called "development" period was not due to initial difficulties in securing patronage, but was because of the refusal by its holding company, Columbia Gas & Electric Corporation, to permit Panhandle Eastern to sell gas in competition with

[17] Re Chicago District Electric Generating Corp., 39 PUR (N. S.) 263, 276; Re Canadian River Gas Co., et al., FPC Op. 73; Re Hope Natural Gas Co., FPC Op. 76.

other subsidiaries and in territory considered as lying within the sphere of influence of other holding company interests. Actually, customers along the line were "clamoring" for service, and no justification for the refusal to sell gas has been offered by the respondents.[18]

[fol. ff] $736,619 is for "payments to utility customers" and "contributions to customers," consisting principally of reimbursements to distributing companies for expense incurred in the change-over from artificial to natural gas, and in promoting sales. Of this sum, $383,722 has been recovered through past operating expenses, and the balance of $352,897 is included in the allowed book cost of plant.

The remaining item of $1,585,914, "value of gas purchase contracts," is a synthetic figure appearing nowhere on the books, representing the purported present value of future savings anticipated in the purchase of gas under certain advantageous contracts. The "value" is based upon the difference between the present field price and the lower contract prices of such gas. It would be a travesty on regulation to permit fictitious amounts of this character to inflate the rate base.

Conclusions as to Rate Base. Our conclusions with respect to the proper rate base as of December 31, 1941, may be summarized as follows:

Actual Cost of Gas Plant in Service at December 31, 1941	$ 78,814,292
Less: Accrued Depreciation	12,596,987
Actual Cost Less Depreciation	$ 66,217,305
Working Capital	920,000
Rate Base	$ 67,137,305

The rate base as of February 28, 1942, determined in the same manner, is $66,697,358.[19] These amounts reflect the

[18] See Columbus Gas & Fuel Co. vs. Public Utilities Commission of Ohio, et al., 292 U. S. 398, 412.

[19]

Actual Cost of Gas Plant in Service at February 28, 1942	$ 78,875,242
Less: Depreciation Reserves	13,097,884
Actual Cost Less Depreciation	$ 65,777,358
Working Capital	920,000
Rate Base at February 28, 1942	$ 66,697,358

actual legitimate cost of the respondents' property as an [fol. gg] assembled whole and an established plant in successful operation.

The respondents contend that $4,944,820 of construction work in progress, and budget estimates totaling $6,372,100 to complete said construction, should be added to the rate base as of February 28, 1942. We conclude that it would be highly improper to include these amounts in the rate base. The facilities under construction are for the purpose of meeting the demands of new or increased business and consist mainly of plant additions to extend service to 80 communities in Michigan including Pontiac, Flint, Jackson, Battle Creek and Kalamazoo, involving service to territory not heretofore served by the respondents. If this construction were included in the rate base, rudimentary principles of fairness would require that full consideration also be given to the [addittional] revenues to be obtained from the added territory. However, the respondents deny that it is possible to estimate such increases in revenues.

The exclusion of this incomplete construction from the rate base does not deprive the respondents of just compensation on their actual investment therein. The respondents follow the practice of capitalizing interests on such amounts during construction. To allow in addition a return during the construction period would result in duplicate charges against the customers. Insofar as the respondents' claim includes future capital expenditures, the same must, of course, be disallowed. As the Supreme Court held in the Natural Gas Pipeline Company of America case, supra:

"* * * the refusal to include in the rate base capital expenditures not yet made can not involve confiscation."

Rate of Return.

A large part of the record is devoted to the subject of rate of return. The evidence on this subject is compre- [fol. hh] hensive and complete, dealing fully with those elements which Courts and Commissions have considered pertinent, such as the financial history of the respondents, the current cost of money, earnings on securities, commodity price indices, etc.

The respondents have advanced a novel theory which assumes that they are entitled to a return on their total capitalization as represented by the principal amounts of their outstanding securities including surplus. The fallacy inherent in this approach, however, is that it ignores the basic principle that the respondents are entitled to a fair and reasonable return upon the actual legitimate cost of their property devoted to the public service, less existing depreciation, plus a reasonable allowance for working capital, and no more.

The evidence discloses that the respondents' business is exceptionally free from serious business hazards. The gas supply is assured for at least 30 to 35 more years. We have made ample provision in the annual depreciation allowance for the restoration of the capital investment in the property over the claimed life of the gas supply. The respondents' markets are rapidly expanding and embrace the large metropolitan area of Detroit, which alone takes 40% of the entire output under a long-term contract. Panhandle Eastern's president testified that the demand for service is so great that within the next year the respondents will be called upon to sell every cubic foot of gas that can possibly be delivered through the lines, and that the capacity factor will increase from 70% to 90%.

It is likewise apparent from respondents' own evidence that Panhandle Eastern has been able to raise considerable capital at low cost. Only recently it successfully completed a financing program at remarkably low rates which resulted in a substantial reduction in its annual cost of capital. In February 1941, Panhandle Eastern sold $18,250,000 of first mortgage and first lien bonds and $5,000,000 of serial notes at an average annual interest cost of 2.74%. In February 1942, it sold an additional $10,000,000 [fol. ii] of first mortgage bonds at an interest cost of 3.13% and $15,000,000 of preferred stock at a cost of 5.86%. After the financing, Panhandle Eastern's annual cost of long-term debt was 2.88% and preferred stock was 5.87%, a combined annual cost of only 3.85% for these securities.

Panhandle Eastern has earned an average of 10.64% on its net investment over the past five years, and Michigan Gas an average of 8.5% during approximately the same period.

We conclude, upon careful consideration of the record in the light of the principles enunciated by the Supreme Court,[20] that 6½% is a fair and liberal annual rate of return upon the rate base allowed herein.

Rate Reduction.

The consolidated gross operating revenue of the respondents in 1941 was $17,789,573.

For the purpose of disposing of the motions for an interim order, we accept the respondents' 1941 consoli- [fol. jj] dated operating expenses as shown on their books (before Federal income and excess profits taxes), with the exception of $293,029 for the amortization of the write-up in "gas sales and purchase contracts" and $6,000 of rate case expense. The operating expenses thus allowed total $7,237,496. Adding Federal income taxes of $1,093,768 computed at the 1941 tax rate on the taxable net income reflecting a fair return of $4,363,925 (6½% of the rate base of $67,137,305 as of December 31, 1941), brings the total allowable operating revenue deductions for 1941 to $8,331,264.

The respondents' 1941 consolidated gross operating revenue, less proper operating revenue deductions, exceeds a fair return by $5,094,384. This amount is available for an immediate rate reduction, as shown by the following tabulation:

---

[20] See Bluefield Waterworks & Improvement Co. vs. Public Service Commission of West Virginia, 262 U. S. 679, 692, wherein it is stated: "What annual rate will constitute just compensation depends upon many circumstances and must be determined by the exercise of a fair and enlightened judgment, having regard to all relevant facts. A public utility is entitled to such rates as will permit it to earn a return on the value of the property which it employs for the convenience of the public equal to that generally being made at the same time and in the same general part of the country on investments in other business undertakings which are attended by corresponding risks and uncertainties; but it has no constitutional right to profits such as are realized or anticipated in highly profitable enterprises or speculative ventures. The return should be reasonably sufficient to assure confidence in the financial soundness of the utility and should be adequate, under efficient and economical management, to maintain and support its credit and enable it to raise the money necessary for the proper discharge of its public duties. A rate of return may be reasonable at one time and become too high or too low by changes affecting opportunities for investment, the money market and business conditions generally".

Gross Operating Revenue	$17,789,573
Operating Revenue Deductions	8,331,264
Income Available for Return	$ 9,458,309
Reasonable Return—6½% of Rate Base	4,363,925
Total Available for Rate Reduction	$ 5,094,384

It is clear that a reduction of $5,094,384 in the respondents' 1941 rates would reduce gross operating revenue to $12,695,189, which amount would yield a fair return upon the rate base as of December 31, 1941, after payment of all necessary and proper operating expenses and charges for that year.

The Test Period. The question arises as to whether the year 1941 is a proper period by which to test the respondents' rates. The record contains the respondents' revenues and expenses from the beginning of operations in 1932 through March 31, 1942. Consideration of these figures convinces us that the latest calendar year, 1941, is the most reliable guide for the future, in view of the changing [fol. kk] economic conditions and the respondents' rapidly expanding business.

The respondents contend that consideration should be given to a $389,000 increase in operating expenses not fully included in their 1941 consolidated income statement, as follows:

	Increased Expenses on Annual Basis	Increases Already Included in 1941 Expenses	Increases Not Included in 1941 Expenses
Payroll Increases	$ 138,000	$ 64,500	$ 73,500
Emergency Property Protection	228,000	6,500	221,500
Amortization of Rate Case Expense[21]	70,000	6,000	64,000
Increased Cost of Employees' Welfare and Pension Expense	30,000		30,000
Total	$ 466,000	$ 77,000	$ 389,000

It is also claimed that allowance must be made for future increases in Federal income and excess profits taxes. Significantly, the respondents do not ask us to consider future increases in revenues.

[21] The total rate case expense claimed is $350,000. The respondents contend that this sum should be amortized over the next five years at the rate of $70,000 per year.

A forecast to be proper must, of course, include a prediction of revenues as well as expenses. The record clearly shows the trends of both. The respondents' operating expenses, before Federal income taxes, increased 9.8% in the first three months of 1942 over the first three months of 1941. The claimed increases in expenses, including amortization of rate case expense, are fully reflected in the 1942 operating expenses. The gross operating revenue increased 13.8% over the same period, while the respondents' net investment in plant declined approximately $700,000. Although the Congress has not yet passed the Revenue Act for 1942, it is certain that Federal income taxes will be increased. The House of Representatives has recently ap- [fol. 11] proved a bill providing for a combined normal and surtax rate of 45%, as compared with the 1941 rate of 31%.

With these data at hand, we can make a reasonable forecast of future operations. Applying these trends to the 1941 revenues and expenses, as adjusted in this opinion, and giving effect to the latest proposed Federal income tax rate of 45%, it appears that increases in revenues will more than offset all increases in expenses and taxes. This is shown by the following tabulation:

	1941	Rate of Increase	Increase	Projected for Full Year 1942
Operating Revenue	$12,695,189	13.845%	$1,757,649	$14,452,838
Operating Expenses, Exclusive of Federal Income Taxes	7,237,496	9.82 %	710,722	7,948,218
Net Earnings Before Income Taxes	$ 5,457,693	19.183%	$1,046,927	$ 6,504,620
Federal Income Tax (31% for 1941 and 45% for 1942)	1,093,768	88.234%	965,077	2,058,845
Net Operating Income	$ 4,363,925	1.875%	$ 81,850	$ 4,445,775

Indeed, it is apparent from the foregoing that the net operating income for the projected year 1942 exceeds by $81,850 the 6½% return of $4,363,925 on the rate base of $67,137,305.

The record compels the conclusion that this forecast is liberal to the respondents. The main transmission line

was operated at a 70% capacity factor in 1941. Panhandle Eastern's president testified that because of anticipated increased sales he fully expects the line to be operated at a 90% capacity factor in the near future. He further testified that the acquisition of Michigan Gas by Panhandle Eastern, effective February 6, 1942, would result in economies of operation which, of course, are not reflected in 1941 expenses.

We find upon the substantial evidence in the record that the reduction of $5,094,384 in the respondents' rates indi- [fol. mm] cated by the 1941 operations, will leave more than sufficient revenues to yield a fair return upon the rate base as of December 31, 1941.

Direct Industrial Sales. Upon the record before us, we consider it unnecessary to make an allocation of the respondents' business as between sales for resale and direct sales. The direct sales are made to 19 industrial customers on an interruptible basis and at prices fixed in competition with other fuels.

According to respondents' own evidence, no capacity has ever been constructed or provided in their gas plant for these direct industrial customers. It is equally clear that deliveries are made to them only when there is available excess off-peak capacity not required by the other wholesale customers. As evidence of this fact, in 1941 the volume of gas sold to the direct industrial customers amounted to 13.2% of the total system sales, whereas on the system peak day of the 1941-1942 winter the direct industrial sales constituted only 2.69% of the total deliveries, due to interruptions and curtailments brought about by the necessity for meeting the wholesale customer requirements.

Testimony of respondents' witnesses discloses that only $128,848 of the entire investment in plant (less than one-sixth of one per cent) is used exclusively in the service of the direct industrials. Moreover, the respondents themselves treat their entire business as a unit and make no segregation of costs or profits on their books as between the two classes of sales. Indeed, Panhandle Eastern's

president testified quite clearly on cross-examination that any attempt to allocate would be "theoretical," "unrealistic" and "not practical" because of the unified character of the business.

Deliveries to the direct industrials are made only when the plant is not fully used in serving the requirements of the wholesale business, and are curtailed or interrupted [fol. nn] when the capacity is required by the wholesale customers. It is apparent that the incidental direct industrial business is in reality a by-product of the wholesale business, comparable to the respondents' gasoline extraction business. All parties are agreed that the expenses and revenues in connection with the sale of gasoline extracted from the natural gas should be treated as an integral part of the respondents' entire operations. Thus, it is manifest from the evidence that the direct industrial sales are purely incidental to the main or principal enterprise, viz.: the wholesale business of the respondents.

It is obvious from the record that respondents have made no clear and convincing showing that the direct industrial sales are so distinct and separate from the general wholesale business that the two cannot here be considered together. We conclude, therefore, that, under such circumstances, it is not unreasonable to treat the entire business as a unit requiring no allocation as between the two classes of sales.

Tax Increases Due to the War Effort.

While we have arrived at certain definite conclusions in disposing of the motions for an interim order reducing rates herein, the tax problem posed by legislation pending in the Congress makes it imperative that we make further comment on this subject.

We take judicial notice of the fact that our country is waging a war for survival. It is common knowledge that there will be increased tax burdens resulting from the requirements inherent in a global conflict. Business as usual is out—in fact, a great many so-called "small enterprises" have ceased to exist. Normal business during this period of grave emergency is at an end. Obviously, no

one can expect to maintain a status or condition of business unaffected by the holocaust now sweeping the world. Increased tax burdens must be borne by the utility which [fol. 60] enjoys a monopolistic position in the economic field, as well as by others who have no such advantage.

Proposals now pending in Congress to raise additional taxes are required to defray in part greatly increased expenditures resulting from the war effort. In this regard, the report of the House Committee on Ways and Means,[22] considering the proposed Revenue Bill of 1942, after first pointing out that "the cost of the war effort is placing upon the Nation a financial burden unequaled in our history," states:

"It is thus apparent that our revenue needs are extreme and your committee have endeavored to secure every dollar of additional revenue which, in its opinion, the national economy can bear. In its effort toward this objective, however, care has been exercised in every instance not to place an unbearable burden upon any taxpayer."

Moreover, the President in his message to Congress July 30, 1941, requesting enactment of legislation for control of prices, stated:

"Inflationary price rises and increases in the cost of living are today threatening to undermine our defense effort."

Thus it appears that the doctrine of unjust enrichment as well as equity and good conscience compel the conclusion that a utility should not be permitted to thwart the purpose and spirit of the war price control legislation and the revenue laws by passing such abnormal tax requirements along to its consumers as an operating expense to be collected in increased rates. Indeed, we feel increased rates on such a basis would be unjustifiable. To allow them would in effect impose upon the consumers a sales tax.

---

[22]Report No. 2333, 77th Congress, 2d Session, July 14, 1942.

[fol. pp] So that there may be no confusion concerning the tax situation in connection with the companies subject to our jurisdiction, where necessary to stabilize utility rates at reasonable levels during the war emergency period, we propose to allow as proper operating expenses only such taxes as may be termed ordinary or normal. For the purpose of distinguishing between ordinary or normal and war emergency or abnormal taxes, we conclude that the basis prescribed in the 1940 Revenue Act establishes the highest possible level of Federal taxes which may be allowed as an element of operating expense for such purpose. The 1941 Revenue Act and the pending 1942 proposal certainly reflect abnormal tax requirements for war purposes.

The conclusions we here express find validity in utterances of other regulatory bodies who were confronted with the problem of abnormal tax requirements in dealing with the utility industry as a result of the first World War.[23] Furthermore, the Public Service Commission of Wisconsin, on May 5, 1942, disapproved the application of the Wisconsin Telephone Company for authority to revise the base rate area and the rates at its Madison Exchange, a proposal estimated to increase the cost of telephone service to the subscribers in that area $290,000 annually. In its opinion denying such request the Wisconsin Commission made this significant comment:

"We do not look with favor upon proposals to increase utility rates in these times * * * rates should not be increased solely because the management may consider that its return is less than it is entitled to ask in normal times."

Moreover, it is evident that Congress intended when it enacted the Emergency Price Control Act of 1942, that [fol. qq] during the prosecution of the present war, this Commission, in carrying out its regulatory responsibilities, should make every reasonable effort to assist in making effective the national policy of price stabilization. In

[23] See Re Western States Gas & Electric Co., PUR 1919B, 485, 493; Re United Fuel Gas Co., PUR 1920C, 583, 606.

this regard we will be alert to the necessity for checking unwarranted increases in utility rates which, if permitted, will contribute to the disruptive inflationary process now threatening to destroy our economy.

Conclusion.

We conclude from the record that the present rates and charges of the respondents are unjust, unreasonable, unlawful and violative of the provisions of the Natural Gas Act. Therefore, until further order of this Commission, we determine for purposes of disposing of the motions before us that the just and reasonable rates, charges, classifications, rules, regulations, practices, or contracts to be hereafter observed by the respondents and fixed by order of this Commission shall reflect an immediate reduction of at least $5,094,384 below those in effect during the year 1941.

An appropriate order will be entered in accordance with this opinion.

[fol. rr] Order Reducing Rates.

United States of America.

Federal Power Commission.

Commissioners: Leland Olds, Chairman, Claude L. Draper, Basil Manly, John W. Scott and Clyde L. Seavey.

September 23, 1942.

City of Detroit, Michigan,
and
County of Wayne, Michigan,
Docket No. G-200. vs.
Panhandle Eastern Pipe Line Company,
and
Michigan Gas Transmission Corporation.

In the Matter of

Panhandle Eastern Pipe Line Company,
Michigan Gas Transmission Corporation,
and
Illinois Natural Gas Company.
Docket No. G-207.

Upon consideration of the entire record herein, including the motions for an immediate order reducing rates, and having on this date issued its Opinion No. 80, which is made a part hereof by reference,

The Commission for the purpose of disposing only of the motions before it for an immediate order reducing rates, finds that:

(1) Panhandle Eastern Pipe Line Company (hereinafter referred to as "Panhandle Eastern") is a corporation organized and existing under the laws of Delaware, is engaged in producing, purchasing and gathering natural gas in the Amarillo field of the Texas Panhandle and in [fol. ss] the Hugoton field in Oklahoma and Kansas; is engaged in the transportation of natural gas in interstate commerce by means of facilities which include (a) a partially looped natural gas main transmission pipe line extending from a point in Moore County,

Texas, known as "Windmill Junction," for a distance of approximately 860 miles through the States of Oklahoma, Kansas, Missouri and Illinois and into the State of Indiana to a point near Dana, near the Illinois-Indiana boundary, and (b) a natural gas main transmission line approximately 33 miles in length extending generally eastward from a point near Muncie, Indiana, to a point approximately 2½ miles east of the Indiana-Ohio boundary; is also engaged in the sale in interstate commerce of natural gas so transported to various purchasers for resale for ultimate public consumption for domestic, commercial, industrial, and other uses; and is a "natural-gas company" within the purview of the Natural Gas Act;

(2) Michigan Gas Transmission Corporation (hereinafter referred to as "Michigan Gas") is a corporation organized and existing under the laws of Delaware; is engaged in the transportation of natural gas in interstate commerce by means of facilities which include (a) two natural gas main transmission pipe lines extending from a point of interconnection with Panhandle Eastern's main transmission line near Dana, Indiana, for a distance of approximately 70 miles, to a point near Zionsville, Indiana; (b) a main transmission line approximately 52 miles in length extending from said point near Zionsville, Indiana, to a point near Muncie, Indiana, where said line is interconnected with Panhandle Eastern's main transmission line; and (c) a main transmission line approximately 230 miles in length extending from said point near Zionsville, Indiana, to Detroit, Michigan; is also engaged in the sale in interstate commerce of natural gas so transported to various purchasers for resale for ultimate public consumption for domestic, commercial, industrial, and [fol. tt] other uses; and is a "natural-gas company" within the purview of the Natural Gas Act;

(3) Illinois Natural Gas Company (hereinafter referred to as "Illinois Natural") is a corporation organized and existing under the law of Illinois, is engaged in the transportation of natural gas in interstate commerce by means of facilities which include the lateral lines extending from Panhandle Eastern's natural-gas main transmission pipe line in Illinois; is also engaged in the sale in interstate commerce of natural gas so transported to various

purchasers for resale for ultimate public consumption for domestic, commercial, industrial, and other uses; and is a "natural-gas company" within the purview of the Natural Gas Act;

(4) The rates and charges demanded, observed, charged and collected by the respondents for the transportation and the sales of natural gas in interstate commerce, set forth in findings Nos. (1) to (3), inclusive, together with the rules, regulations, practices, and contracts, affecting such rates and charges, are subject to the jurisdiction of this Commission;

(5) Panhandle Eastern, Michigan Gas, Illinois Natural (hereinafter referred to collectively as "the respondents"), and Indiana Gas Distribution Corporation (hereinafter referred to as "Indiana Gas") are under common control and ownership, and are operated as a single, interconnected and integrated system for the production, purchase, gathering, transportation, sale and delivery of natural gas;

(6) The actual legitimate cost before depreciation, within the meaning of Section 6(a) of the Natural Gas Act, of the respondents' gas plant used and useful as of December 31, 1941, is not more than $78,814,292, as follows:

Panhandle Eastern	$62,665,568
Illinois Natural	2,871,194
Michigan Gas	12,643,847
Indiana Gas	194,357
Pipe Line purchased from The Ohio Fuel Gas Company	439,326
Total	$78,814,292

The said actual legitimate cost of $78,814,292 gives effect to the acquisition on February 6, 1942, by Panhandle Eastern of Michigan Gas and Indiana Gas and the purchase by Panhandle Eastern from the Ohio Fuel Gas Company of a pipe line approximately 33 miles in length extending eastward from a point near Muncie, Indiana, to a point approximately 2½ miles east of the Indiana-Ohio boundary;

(7) The respondents' accumulated depreciation reserve as of December 31, 1941, totaling $12,596,987, as follows:

Panhandle Eastern	$10,405,047
Illinois Natural	502,976
Michigan Gas	1,661,966
Indiana Gas	26,998
Total	$12,596,987

are accepted, for the purpose of these proceedings, as the accrued depreciation existing in the respondents' gas plant as of December 31, 1941, and should be deducted from the actual legitimate cost of $78,814,292 in arriving at the rate base;

(8) The sum of $920,000 is the proper and reasonable allowance for working capital for the respondents;

(9) The sum of $67,137,305 is the proper rate base for the purpose of these proceedings, as shown by the following tabulation:

[fol. vv] Actual Legitimate Cost of Gas Plant in Service at Dec. 31, 1941	$78,814,292
Less: Accrued Depreciation	12,596,987
Actual Legitimate Cost Less Depreciation	$66,217,305
Working Capital	920,000
Rate Base	$67,137,305

and the said rate base of $67,137,305 reflects the actual legitimate cost of the respondents' property as an assembled whole and an established plant in successful operation;

(10) An annual rate of return of not more than 6½% on the rate base of $67,137,305, or $4,363,925, is a fair and reasonable return to the respondents;

(11) The respondents' consolidated gross operating revenues in 1941 totaled $17,789,573;

(12) The respondents' total consolidated 1941 operating expenses, as shown on their books (before Federal income and excess profits taxes), are accepted as the proper annual operating expenses for the purpose of these proceedings, with the exception of $293,024 for amortizing a write-up in "gas sales and purchase contracts" and $6,000

of rate case expense; the amount so accepted is $7,237,496; and adding thereto Federal income taxes of $1,093,768 makes the total annual consolidated operating revenue deductions $8,331,264 for the purpose of these proceedings;

(13) The respondents' 1941 consolidated gross operating revenues, less deductions for proper operating expenses, exceed a fair return on the rate base of $5,094,384, as shown by the following tabulation:

Gross Operating Revenues	$17,789,573
Operating Revenue Deductions	8,331,264
Income Available for Return	$ 9,458,309
Fair Return—6½% of Rate Base	4,363,925
Total Available for Rate Reduction	$ 5,094,384

[fol. ww] (14) The rates and charges made, demanded, or received by the respondents for or in connection with their transportation and sale of natural gas in interstate commerce for resale for ultimate public consumption are unjust, unreasonable and excessive;

(15) The rates and charges of the respondents, after reflecting the reduction hereinafter ordered, will be just and reasonable;

Therefore, the Commission orders that:

(A) The rates and charges made, demanded, or received by the respondents for or in connection with their transportation and sale of natural gas in interstate commerce for resale for ultimate public consumption shall be so reduced as to reflect, when applied to respondents' 1941 transportation and sales, a reduction of not less than $5,094,384 per annum below their 1941 consolidated gross operating revenues of $17,789,573;

(B) The respondents shall file on or before October 15, 1942, new schedules of rates and charges for or in connection with their transportation and sale of natural gas in interstate commerce for resale for ultimate public consumption, which shall reflect the reduction in consolidated gross operating revenues ordered in paragraph (A) above, which new schedules of rates and charges shall be effective as to all bills regularly rendered on or after November 1, 1942;

(C) The Commission reserves the right to reject all or any part of such new schedules and in lieu thereof to prescribe any other schedules by further order;

(D) On and after the effective date of the new schedules of rates and charges filed and made effective in accordance with paragraph (B) above, the respondents shall cease and desist from making, demanding, or receiving any rates and charges which do no reflect the reduction ordered in paragraph (A) above;

[fol. xx] (E) The record herein shall remain open for such further proceedings as the Commission may deem necessary or desirable;

(F) This order shall not be construed as an acquiescence by this Commission in any estimates or determinations of original cost, or any valuation of property, claimed or asserted by the respondents.

By the Commission.

LEON M. FUQUAY,
Secretary.

[fol. yy] Exhibit B.

Order Extending Time Within Which to File New Schedules of Rates and Charges.

United States of America.

Federal Power Commission

Commissioners: Leland Olds, Chairman, Claude L. Draper, Basil Manly, John W. Scott and Clyde L. Seavey.

October 12, 1942.

City of Detroit, Michigan,

and

County of Wayne, Michigan,

Docket No. G-200. vs.

Panhandle Eastern Pipe Line Company,

and

Michigan Gas Transmission Corporation.

In the Matter of

Panhandle Eastern Pipe Line Company,

Michigan Gas Transmission Corporation,

and

Illinois Natural Gas Company.

Docket No. G-207.

Upon motion filed with the Commission October 9, 1942, by Panhandle Eastern Pipe Line Company, Michigan Gas Transmission Corporation and Illinois Natural Gas Company, praying that additional time be granted Respondent-Defendants for the preparation and filing of new schedules of rates and charges as provided for in Section (B) of the Commission's order of September 23, 1942:

It appearing to the Commission that:

Good cause has been shown for the granting of the extension of time hereinafter ordered:

[fol. zz] The Commission orders that:

The time within which the Respondent-Defendants shall file the new schedules of rates and charges required by the Commission's order of September 23, 1942, be and the same is hereby extended to November 10, 1942, provided, however, that:

(i) The extension of time herein granted shall not operate as a change of the date on which the new schedules of rates and charges shall be effective, namely, November 1, 1942;

(ii) Nothing in this order shall be construed as staying the time within which Respondent-Defendants shall file a petition for rehearing or a petition for review as provided in Section 19 of the Natural Gas Act.

By the Commission.

Docket No. G-200. vs.

Panhandle Eastern Pipe Line Company and Michigan Gas Transmission Corporation.

Washington.

July 15, 1941.

[fol. 3] Proceedings.

Trial Examiner: The hearing will be in order, gentlemen, in the matter of the complaint of the City of Detroit, Michigan, and the County of Wayne, Michigan, against the Panhandle Eastern Pipe Line Company and Michigan Gas Transmission Corporation. This is Federal Power Commission Docket No. G-200.

. . . . . .

[fol. 7] Please let us have your appearances, gentlemen, in the order in which the various parties have been stated, such as the City of Detroit, first, and the County of Wayne, next.

[fol. 8] Mr. Lee: James H. Lee, on behalf of the Petitioner, City of Detroit,—Assistant Corporation Counsel.

Mr. Goodman: Harold Goodman, for the County of Wayne.

Mr. Williams: James W. Williams, Assistant Attorney General, State of Michigan, appearing for the Michigan Public Service Commission.

Mr. Chamberlain: Park Chamberlain, and Henry A. Montgomery, for the Michigan Consolidated Gas Company, as interveners.

Mr. Wheat: Glenn W. Clark, D. H. Culton, Carl I. Wheat, and Robert E. May, for the Defendant, Panhandle Eastern Pipe Line Company.

Mr. Baldridge: Milton C. Baldridge, for the Respondent, Michigan Gas Transmission Corporation.

Mr. Slaff: For the Federal Power Commission, George Slaff and W. Russell Gorman.

Trial Examiner: That completes our record of appearances, I take it, gentlemen.

* * * * * * * * *

[fol. 19] MANFRED K. TOEPPEN,

a witness produced on behalf of the Petitioners, having been first duly sworn, was examined and testified as follows:

Direct Examination.

By Mr. Goodman:

Q. Mr. Toeppen, where do you reside?

* * * * * * * *

[fol. 20] A. My legal residence is Lansing, Michigan, and I have been living in Alexandria, Virginia.

Q. What is your occupation?

A. I am an engineer.

Q. What is your present connection?

A. At present, I am on leave from my position with the Communications Property Section of the Federal Communications Commission.

Q. And you are here, or you have prepared your work here, under private employment, have you not?

A. I have prepared my work here and am testifying as a private consultant for the City of Detroit.

Q. Now, Mr. Toeppen, you are a graduate of what institution?

A. Washington University, in 1908.

Q. With what degree?

A. Bachelor of Science in Electrical Engineering.

Q. And upon what date did you graduate?

A. 1908.

Q. How many years engineering experience have you had?

A. I have been continuously employed in engineering since that time.

Q. And in that period, what branches or subjects of engineering were you primarily engaged in?

[fol. 21] A. Various forms of public utility services, street railway, electric power, telephone, gas, natural gas, either as an employee of operating companies or as an employee of regulatory bodies, or in private practice.

Q. Now, when you left college, what was your first connection?

A. I went to work for the United Railways Company of St. Louis.

Q. What capacity?

A. I was first assistant engineer in the power department, and then was chief inspector of the line, or overhead department.

Q. Now, did you remain in this connection until you went into the telephone line work? A. I did.

Q. And when was that?

A. That was first as student, and then as exchange engineer with the Southwestern Bell Telephone Company of St. Louis, in 1912.

Q. And what did your work consist of, for the most part?

A. The laying out, planning, and cost estimating of telephone distributing plants, poles, wires, cables, and conduit.

Q. And from that job, what was your next connection?

A. Still with the telephone companies, in the office of [fol. 22] chief engineer of the central group of the Bell Telephone Companies of Chicago, from July, 1914, until February, 1915, mostly on valuation and cost work.

Q. And did you continue further in the telephone line work? A. Yes.

Q. In what capacities?

A. In February, 1915, I transferred to the organization of the Receivers of the Central Union Telephone Company, which were operating the Bell Company properties in Indiana, Illinois, and Ohio, under a receivership.

Q. And—

A. (Interposing) And was in the office of chief of engineers.

Q. What work were you in charge of?

A. As assistant to the general commercial engineer in charge of valuation, rates, and fundamental plant studies.

Q. Now, did you establish a connection with the Michigan State Telephone Company?

A. In 1918 I went with the Michigan State Telephone Company at Detroit, first as special telephone line engineer and then as valuation engineer.

Q. Well, at around that time,—you left it subsequently, —you left the Michigan State Telephone Company and what was your next connection?

[fol. 23] A. With the General Oil Company as chief engineer in charge of lease surveys and engineering phases of drilling.

Q. Did you subsequently secure a connection with the Michigan Public Utilities Commission? A. I did.

Q. When?

A. April, 1920, I became valuation engineer for the Michigan Public Utilities Commission at Lansing, remaining as valuation engineer for two years, when I became chief engineer in charge of all of the work for the Commission.

Q. Now, as chief engineer what did your work consist of, in general?

A. Directing the engineering work relating to all utilities under their jurisdiction such as manufactured gas and electric light and power and telephones and interurban railways.

Q. Now, have you, from time to time, worked in any private capacity as an engineer?

A. In July, 1924, I took leave of absence from the Michigan Commission to become its consultant in charge of the second investigation of the Michigan Telephone Company properties, and after completing that work, I resigned in order to enter, or rather to continue, private practice as a consultant for the City of New York in the telephone proceedings both before the Commission and the Federal [fol. 24] courts and for the Michigan Commission and the Attorney General of Michigan in the proceedings between the Michigan Bell Telephone Company and the State of

Michigan in the Federal court at Detroit, and consultant for the Michigan Commission in connection with the application of the United Home Telephone Company of Muskegon, and consultant for the Detroit-Canada Tunnel Company in its security application, and for the Tri-County Telephone Company in its application for securities and rates; also, in Michigan, and for the Michigan Commission, again, in the case of the Michigan Federated Utilities, Inc., versus the Commission, relating to gas rates in Mount Clements; and for the cities of Dearborn and River Rouge in the case of the City of Detroit versus Detroit Edison Company regarding rates in the Detroit area before the Michigan Commission; and, in 1931, again for the Michigan Commission, in another investigation of the Michigan Bell Telephone Company, and then again, in 1934, I became chief consulting engineer of the Michigan Commission.

Q. Now, in the period from 1925 to 1934, all that period, were you a practicing general consulting engineer?

A. I was.

Q. And you were a specialist, more or less, in rate matters? A. I was.

Q. Rather more than less? A. Yes.

[fol. 25] Q. And during your experience, did you have occasion to study the principles involved in the valuation of public utility properties? A. I did.

Q. And did you have occasion to study the principles involved in the establishment of rates for public utility services? A. I did.

Q. And did these include substantially all manner of public utilities? A. Yes.

Q. Gas and electric rates and power, included, as well as telephones? A. That is right.

Q. Now, have you had occasion also to study the principles of depreciation applicable to rate-fixing? A. I have.

Q. You had occasion also to study the elements of going value applicable in the fixing of rates, did you?

A. I did.

Q. And, in short, it was your business to handle and to apply every phase of appropriate principle to your knowledge, to the general subject of regulation of rates?

A. That is correct.

[fol. 26] Q. Well, what connection did you have after you were chief consulting engineer for the Michigan Public Utilities Commission?

A. I would like to review some of my work in that connection before going ahead.

Q. Very well, proceed.

A. During the engagement which lasted from March, 1934, to May, 1935, I was in charge of all engineering work of the Commission again, and for part of the time in charge of a substantial part of accounting; incidentally, in the 1924 investigation of the Michigan Bell Telephone Company, I had also been in charge of the accounting work as well as the engineering work, and in the 1934 engagement, there was another really continued rate proceeding against the Michigan Bell Telephone Company, and there were a number of—one principally, I believe, and some minor,—but, one principal natural gas transmission line case before the Michigan Commission, and that was concerning the Muskegon supply by the American-Michigan Pipe Line Company, and a number of smaller light and power rate cases, and the writing of the Michigan Commission's rules for production, transmission, and sale of natural gas by a committee of which I was chairman.

Q. Did you have occasion, Mr. Toeppen, to become familiar with the principles involved in the valuation and the rates affecting the gas transmission companies,— [fol. 27] natural gas? A. I did.

Q. What was your connection subsequent to that of chief consulting engineer for the Michigan Commission?

A. On May 1, 1935, I went to the Federal Communications Commission as principal telephone engineer, subsequently becoming chief of the Valuation and Depreciation Section of the special investigation dealing with the investigation of various aspects of depreciation practices of telephone companies.

Q. Have you had some private practice during that period?

A. Not during that first period; that engagement lasted during the continuance of the special investigation and terminated January 1, 1937, I believe, when I became a member of the regular staff of the Commission as chief of the Communications Property Section where I have continued with the work we had been doing in the Valua-

tion and Depreciation Section and, too, certain additional duties of which I have been in continuous charge since. During this last engagement, I have taken leave on two prior occasions to engage in private practice.

Q. And were they engagements in behalf of public representatives?

A. They were: the first time, for the Michigan Public [fol. 28] Utilities Commission, to prepare a study of the gas division of the Consumers Power Company at Kalamazoo, Michigan; and on the second occasion, to serve the Prosecuting Attorney of Wayne County in the Michigan Consolidated Gas Company case before the Commission.

Q. Mr. Toeppen, have you made an investigation of the operating results during the past several years of the Panhandle Eastern Pipe Line Company and the Michigan Gas Transmission Company? A. I have.

Q. And will you state the sources and general nature of that investigation?

A. The sources were the reports of these companies filed with the Federal Power Commission for the years 1939 and 1940; the registration statement filed by the Panhandle Eastern Pipe Line Company with the Securities and Exchange Commission, and the information contained in Moody's Reports on Public Utilities, together with the general knowledge of the territory traversed by the pipe lines, at least east of Kansas City, and a rather detailed knowledge of the territory east of Kansas City—and a knowledge of the gas consumption conditions in Detroit, and the general knowledge of the economic conditions of [fol. 29] the entire Middle West through many years of living and working in that territory.

Q. Have you prepared a statement of the operating results of Panhandle Eastern Pipe Line Company and Michigan Gas Transmission Corporation in exhibit form?

A. I have.

Mr. Goodman: I desire to have the exhibit marked, please.

Trial Examiner: The reporter will mark this exhibit as Exhibit No. 1 for identification.

(The Document Referred To Was Marked For Identification as Exhibit No. 1.)

Mr. Goodman: Exhibit No. 1 consists of six pages marked 1-A to -F. I will hand the original to the Commission.

. . . . . .

[fol. 30] By Mr. Goodman:

Q. What does Exhibit 1 embody?

A. Exhibit 1 is a summary of the recorded costs of the properties of the Panhandle Eastern Pipe Line Company and the Michigan Gas Transmission Company and of the operating results during the years 1938, 1939 and 1940.

Q. And does Exhibit 1 represent your opinion of those subjects based upon the data that you have mentioned?

A. I wouldn't say any opinion there, it is a summary of facts.

Q. It represents the facts which come to your attention from the data mentioned?

A. They do.

Q. Now, I offer Exhibit 1 consisting of six sheets in evidence.

Mr. Wheat: Mr. Examiner, I wonder if we can reserve ruling until we have had an opportunity to examine the exhibit? This is the first time we have seen it. It comes to us entirely cold.

Trial Examiner: The ruling on admission will be deferred for the time being.

Mr. Baldridge: I would like to have ruling reserved on behalf of the Michigan Gas Transmission Corporation.

Trial Examiner: Very well.

[fol. 31] By Mr. Goodman:

Q. Will you proceed to explain the exhibit and the matter included therein?

A. The first sheet of this exhibit is a summary of the details set forth in the following five sheets which have been drawn from the annual reports of the two companies.

The first several lines, the first two lines show the recorded cost less recorded reserves of the Michigan Gas Transmission and Panhandle Eastern Pipe Line companies as at the end of the three years, 1938, '39 and '40.

The second line is a work line in which I laid the foundation for arriving at an average and the third line is the average cost less reserves during 1939 and 1940.

For 1938 I have used the cost at the end of the year as I could not get from the annual reports the cost less reserves at the beginning of 1938.

The next line is an allowance for working capital based on an analysis of the approximate amount of pay rolls of the two companies.

The line marked "Total" is the cost, less reserves, plus working capital of the properties of the two companies, of the Panhandle Eastern and Michigan Gas Transmission companies, used in producing and transmitting gas from the Texas and Kansas fields to the various customers en route in Detroit and other eastern points at the end of the pipe line.

[fol. 32] Mr. Wheat: Mr. Examiner, counsel has no objection to my asking a question for information, if I may, to clarify one matter here, if that will be agreeable to you, sir.

Trial Examiner: Is that satisfactory, Mr. Goodman?

Mr. Goodman: It is satisfactory. I think that counsel should be permitted to ask such questions in matters of this sort in order that they may understand the testimony as it proceeds.

Mr. Wheat: Thank you, sir.

Just one question, Mr. Toeppen. Are we to understand that what you have done on these figures on Exhibit 1 is to take figures obtained from file data, as you have stated, with respect to these two separate corporations and simply add them together and get your results?

The Witness: I have added together, as I will explain, with respect to pages 2, 3 and 4 of this exhibit the reported cost of gas plant from the reports of these two companies to get the cost of the entire property used in producing and transmitting gas from the Texas and Kansas fields to the various customers along the line and at the end of the line.

Mr. Wheat: Then any figures on page 1 of Exhibit 1, are we to understand, apply to the two companies together in the manner you have suggested, not to each individual company?

The Witness: They apply to the two companies jointly, being the entire property used and useful in supplying [fol. 33] gas to the customers of the Panhandle Eastern Company and of the Michigan Gas Transmission Company.

Mr. Wheat: I see. Well, I assume, Mr. Goodman, that an explanation of how the figures were arrived at will be shown later, but I just wanted to find out how you had done that. Thank you.

By Mr. Goodman:

Q. Proceed.

A. The line, "Utility Operating Revenue," is the combined utility operating revenue as reported for the Panhandle Eastern Pipe Line Company and for the Michigan Gas Transmission Company for the years indicated.

The line, "Percent Utility Operating Income of Average Cost Less Reserves of Utility Plant, Plus Working Capital," is simply the ratio of the last preceding line to the line marked "Total" and that shows that these companies combined earned a return, after provision for depreciation, depletion and amortization, of 7.96 percent of the cost less reserves in 1938, subject to possible adjustment between the end of the year, the average figure, and in 1939 10.59 percent was the average and 10.30 percent was the average in 1940.

The bottom of the sheet is simply an analysis of the amounts set aside for depreciation, depletion and amortization during each of these years as measured against the first cost as reported in the books of the properties [fol. 34] of the companies, the first cost being shown in the first three lines of the sub-group developed similarly to an average during the year as was done with the first three items on the page.

The next line is the total of the provisions for depletion, depreciation and amortization and the last line is the ratio which shows these provisions to have been at the

rate of 3.53 percent of the first cost of plant in 1938, 3.67 in 1939 and 3.32 in 1940.

Now, on the second page is shown separately the information with respect to each of the two companies which were combined, Column A being the information with respect to the Panhandle Eastern, Column B with respect to Michigan Gas Transmission Company and the last column being the total of the two.

I think the title of the lines and the operations performed are, in general, self-explanatory. I have added back the reserves for amortization of gas sales and purchase contracts so as to get a complete first cost instead of a mixed first and depreciated cost of plant and I have deducted construction work in progress because construction work in progress is not properly a part of a rate base because its earnings and its provision for protection of the investors are reflected in the interest-during-construction allowance included in construction work in progress.

Then, I have summarized in line 6 the various reserves [fol. 35] provided by the company according to the total set forth in the annual reports, again including the amortization of gas sales and purchase contracts which I added back up in line 2.

Then I deduct the total of these reserves from the cost new of plant in service to determine the cost, less reserves, which is set forth in line 7.

In lines 8 to 12 I combine the reported utility operating income with the provisions for depreciation, depletion and amortization in order to arrive at the total amount available for depreciation, depletion, amortization and return.

This first sheet is for the conditions as of December 31, 1938 and the same operation is repeated for the condition at the end of 1939 in the next sheet and for the condition at the end of 1940 in the following sheet marked "1d" in the lower left-hand corner.

The sheet after that, 1e, is a comparison of current assets, current and accrued assets and current and accrued liabilities to determine the probable working capital on this particular basis of estimating.

The first two numerical columns set up the amounts shown in the annual reports for the two companies as of the end of 1939 and '40 and derive the excess of assets over liabilities which turned out to be a deficiency in 1938 and of substantial magnitude in 1939 and '40. However, as [fol. 36] shown at the bottom of the page, there was a substantial increase in cash in 1939 and 1940 over the cash in 1938 which, in view of the increase in investment in fixed capital, I assume to be related to the construction operations carried on in the latter years and not relating to operation and I have, therefore, adjusted the balances in 1939 and 1940 by the excess of the cash in those years over the cash in 1938 on the assumption that that additional cash was acquired for construction and not for operating purposes.

After this adjustment, liabilities exceed assets in 1938 and in 1940 and assets slightly exceed liabilities in 1939. On the basis of this condition, there would be no need for any working capital allowance in the rate base.

I have further on sheet 1f, lower left-hand corner, roughly approximated the pay rolls by taking the amounts shown for the year 1940 for those accounts which are predominantly labor accounts, although I have adjusted the operation accounts by deducting the gas used in transmission included in it, and I have reduced administrative and general expenses by one-half on the assumption that it contains legal services and insurance and items of that kind which are not of the pay-roll character and have derived the total, approximate total, in the amount of $1,269,000 during the year or approximately one hundred five thousand-odd, one hundred six thousand a month, and I have allowed, as shown on the first page, $100,000 of [fol. 37] working capital, being the approximate average monthly pay roll.

Q. Is it your opinion that that allowance is adequate for the amount to be included in the calculation? A. It is.

Mr. Goodman: That covers Exhibit L. I renew the offer of Exhibit 1 in evidence.

Mr. Wheat: We should like the privilege of having ruling reserved until the conclusion.

Mr. Baldridge: I would like to reserve my objection to Exhibit 1 until further cross-examination.

* * * * * * * *

Trial Examiner: You have further testimony?

Mr. Goodman: Oh, yes, quite a bit.

I desire to have this paper marked Exhibit 2 for identification.

(Document referred to was marked Exhibit 2 for identification.)

Mr. Goodman: I am supplying three copies.

By Mr. Goodman:

Q. Will you identify the paper marked Exhibit 2?

* * * * * * * *

[fol. 38] Trial Examiner: Before we take that recess, however, I should like to express a request. It is evident that there are various companies with various affiliations which are now or will ultimately be involved in this proceeding and my attention was called yesterday to the advance sheets of the Supreme Court reports, the case of Missouri-Kansas Pipe Line Company, Panhandle Eastern Pipe Line Company vs. United States of America, reported in Volume 85, No. 9, page 586, which gives a considerable part of the affiliations existing between the several companies mentioned in that decision.

The Missouri-Kansas Pipe Line Company and its relation to Panhandle Eastern are set forth there, but I am also informed that there have been recent changes in the matter of affiliations.

I would like to have you give us very early in the record, right after the luncheon recess if possible, an exact state-
[fol. 39] ment of the present existing affiliations between the several companies, all of them, and if there are further changes prospective in affiliations, I would like to have some exact statement concerning the status of such negotiations.

I think that is important for us to have in the record immediately in the early part of the proceedings.

* * * * * * * *

[fol. 42] Mr. Clark: Your Honor, responding to your request made just before the noon adjournment, we, on behalf of Panhandle Eastern Pipe Line Company, have attempted to assemble the correct facts and figures for you with respect to the Panhandle Eastern Pipe Line Company's status concerning affiliations, and I will give you those, very briefly:

As to the capital structure of Panhandle Eastern Pipe Line Company, there are outstanding 807,367 shares of common capital stock; also, 100,000 shares of Class A 6 percent participating preferred stock; also, 10,000 shares of Class B preferred stock which is non-callable and has the right, as a class, to elect two directors.

Of this stock, which is all of the outstanding stock of the company, 404,326 shares of common stock is owned by Gano Dunn and held beneficially for Columbia Oil & Gasoline Corporation as trustee under a so-called consent decree; 339,475 shares of the common stock is owned by Missouri-Kansas Pipe Line Company; the balance of the common stock, being 63,566 shares, is owned by approximately 1,500 other stockholders.

All of the Class A preferred stock and the Class B preferred stock is owned or held by Gano Dunn as trustee and held beneficially for Columbia Oil & Gasoline Corpora-
[fol. 43] tion.

Recently, there was a hearing before the Securities and Exchange Commission, and, on May 28, 1941, that Commission entered findings and its opinion, in which it held Columbia Oil and Gasoline Corporation to be a subsidiary of Columbia Gas & Electric Corporation, and held this defendant, the Panhandle Eastern Pipe Line Company; to be a subsidiary of both Columbia Oil & Gasoline Corporation and of Columbia Gas & Electric Corporation. It also held that Panhandle Eastern Pipe Line Company was not a subsidiary of Missouri-Kansas Pipe Line Company.

Leaving now that finding and opinion of the Commission, which I am going to hand Your Honor at the close of this statement,—Michigan Gas Transmission Corporation, which is codefendant with Panhandle Eastern Pipe Line Company, is a direct subsidiary of Columbia Gas & Elec-

tric Corporation. Since the finding of the Securities and Exchange Commission, a contract has been entered into between the Columbia Gas & Electric Corporation, Columbia Oil & Gasoline Corporation, and Missouri-Kansas Pipe Line Company, subject to the approval of the Securities and Exchange Commission and of the Delaware court, which, if and when carried out, will change the existing status of those companies and their relationship to Panhandle Eastern Pipe Line Company which is not a party to that contract and does not have a copy of it, but there [fol. 44] has been handed to me, here, a summary of the contract insofar as it is pertinent to Panhandle Eastern Pipe Line Company. Under that contract, if and when carried out, Michigan Gas Transmission Corporation is to be sold by Columbia Gas & Electric Corporation to Panhandle Eastern Pipe Line Company at cost. Panhandle Eastern is to have the right to acquire from Columbia Gas & Electric Corporation other connecting pipe lines in Indiana for approximately $355,000. These would constitute all of Columbia Gas & Electric Company's lines in Indiana.

The two classes of outstanding preferred stock of Panhandle Eastern Pipe Line Company would be refinanced in a public issue contemplated. Columbia Oil & Gasoline Corporation would distribute its stock in Panhandle Eastern Pipe Line Company,—that is, the stock in Panhandle owned by the Columbia Oil & Gasoline Corporation, and held by Gano Dunn as trustee; and, Missouri-Kansas Pipe Line Company would distribute its common stock—its Panhandle Eastern Pipe Line Company common stock—at the same time.

A new and independent Panhandle Eastern Pipe Line Company board of directors would be elected and a new executive head would be installed.

This contract, as I have stated, will be subject to approval by the Securities and Exchange Commission and the Delaware Federal court.

I am sorry I do not have a copy of that contract, but [fol. 45] as I say, we are not a party to it and I do hand you the findings and opinion of the Securities and Exchange Commission in that recent hearing.

* * * * * * * *

[fol. 46] Mr. Chamberlain: Michigan Consolidated Gas Company is a wholly owned subsidiary of American Light & Traction Company. American Light & Traction Company, in turn, is a subsidiary of United Light & Railways Company, the latter company owning about 53 percent, I believe, of the voting shares. There is also, at the moment, a relationship there with United American Company, a company now about to be dissolved, but United American, again, is a wholly owned subsidiary of United American Railways, so the two are about to be merged into one. United Light & Railways is a wholly owned [fol. 47] subsidiary of United Light & Power Company, a public utility holding company registered under the Act of 1935.

* * * * * * * *

[fol. 48] MANFRED K. TOEPPEN

resumed the witness stand on behalf of the Petitioners and, having been previously duly sworn, was examined and testified further as follows:

Direct Examination (resumed)

By Mr. Goodman:

Q. Mr. Toeppen, during the recess you made some corrections in Exhibit No. 1, as heretofore offered, did you not?

A. Yes; in checking the figures in the proposed Exhibit No. 2, I found that they came out of Exhibit No. 1 and that there had to be corrections on the first sheet of Exhibit No. 1.

Q. And you have a substitute now for Exhibit No. 1?

A. I do.

Q. Now, is everything included in your testimony applicable to the Exhibit No. 1 as corrected, which you offer now?

A. Everything I stated is applicable, with the exception that certain figures in the first and second columns, in the last five lines, will read as shown on the revised exhibit, rather than as read on the original exhibit.

[fol. 49] Q. Well, the testimony given—

A. (Interposing) Applies to the revised exhibit.

Q. Is applicable to Exhibit No. 1 as now revised?
A. It is.

Mr. Goodman: Your Honor, I ask leave to withdraw Exhibit No. 1, as presented, and to present the substitute for it, including the corrections. Now, the request for withdrawal and substitution applies only to page 1 of Exhibit 1,—the rest of the exhibit stands as it is.

Trial Examiner: You may make the necessary changes and assist the reporter so that the original exhibit will stand.

Mr. Goodman: Very well; if the original is to stand, this will be put in as a correction.

Trial Examiner: That is correct.

Mr. Goodman: I suggest, but I leave it to Your Honor's judgment,—it might perhaps be better to withdraw the exhibit as presented today, completely, because it will just stand in the way. I think it best to take up Exhibit 1 as presented,—page 1 of Exhibit 1, and put the substitute instead.

Trial Examiner: Very well.

(Whereupon, page 1 of Exhibit No. 1 for identification, as originally offered, was removed, and a corrected page 1 to Exhibit 1 was placed in the record.)

Mr. Goodman: May I have this exhibit marked for identification as Exhibit No. 2?

* * * * * * * *

[fol. 50] By Mr. Goodman:

Q. Will you proceed to identify Exhibit No. 2?

A. Exhibit No. 2 is a compilation from the annual reports of the companies, supplemented by certain calculations intended to show the relation of the amount available for depreciation, depletion, amortization, and return, as a percentage of the cost new of the properties during the years 1938, '39, and '40, and in the lower part, to show the requirements for depreciation, depletion, amortization, and return on the assumption of a 30-year life and annual returns of 5, 6, 7, and 8 percent on the value, together with excess of present amount available for depreciation,

depletion, amortization, and return over these requirements.

Mr. Goodman: I offer Exhibit No. 2 in evidence.

Mr. Wheat: We would like to have the same ruling on that, Your Honor; it apparently is merely a mathematical calculation of the figures in Exhibit No. 1.

Trial Examiner: Very well, we will reserve ruling on the admission of the exhibit until the cross-examination is completed.

Mr. Baldridge: May the record also show that we make the same request, your Honor?

[fol. 51] Trial Examiner: Very well.

By Mr. Goodman:

Q. Will you proceed, Mr. Toeppen, to explain the conclusions shown by Exhibit No. 2?

A. The fifth line shows that in 1938, the ratio of the amount available for depreciation, depletion, amortization, and return was 10.3 per cent of the first cost of the property at the end of the year, plus $100,000 working capital allowance, and a similar figure for 1939, in terms of the average cost of plant, was 12.82 percent, and in 1940, 12.15 percent.

Then, in the group of items marked, or titled, "Annual Requirement for Depreciation, Depletion, Amortization and Return on Utility Plant," there is calculated the amount required for these items on the assumption of a 30-year life and the full rates of return of 5, 6, 7, and 8 percent.

In the next group of items marked "Return Requirement on Working Capital," same annual requirements, the annual requirement at the same rate of return for the working capital is determined; and in the group of lines titled "Total requirement," the requirement for depreciation and so forth on the plant and the return requirement on the working capital are added together to show the total requirement for depreciation, depletion, amortization, and return on both the plant and the working capital in the amounts shown in those lines, ranging from $4,754,000, [fol. 52] for the year 1940, for a 5 percent return basis,—

to $6,485,000, in 1940, for an 8 per cent return basis. These requirements are less than the amount presently available, shown in line 4, above, and the excess is shown in the last group of lines. For a 5 percent return, the excess amounts to $4,118,000, in 1940, and for an 8 percent return,—to $2,387,000 in 1940.

At the bottom of the page, there is a note explaining the basis for using a 30-year life for the depreciation, depletion, and amortization calculations.

The company's estimate as reported in the registration statement filed in 1940 showed a gas supply adequate for 25 years, and the field had been in use 8 years, which would give,—or rather, properly in use for 8 years,—which would give a total life of 33 years. To allow for shorter life of additions which have been made since 1932, and which may be made in the immediate future, and for the fact that they have been amortizing certain gas purchases and sales contracts on a 10-year basis,—I have used 30 years, rather than 33 years in this calculation.

Q. Is it your conclusion, Mr. Toeppen, and your testimony here, that if the Commission should find that an 8 percent return upon the property used and useful in the transmission of natural gas by Panhandle Eastern and Michigan Gas Transmission Corporation, that if the Commission should find an 8 percent return a reasonable rate [fol. 53] of return,—then the present income of these companies is excessive by $2,387,000?

* * * * * * * * *

[fol. 54] The Witness: That is my conclusion, subject to the modification that there would be some income tax adjustments if such excess were found to exist.

[fol. 55] I have made no attempt to determine the income tax adjustment which would follow a reduction of rates in this amount.

Trial Examiner: And with this further fact,—is it not true, Mr. Toeppen, that all of the information which you have assembled in Exhibits Nos. 1 and 2 for identification, is exclusively from the official reports to which you have referred, fundamental data, and you do not claim any

access to the books of the companies, and your survey and opinion are based entirely on these official records?

The Witness: Yes, and no, Mr. Examiner; because I have, as I will present in subsequent exhibits, certain other considerations which go beyond examination of the records in that they give me information about the properties such as I would have procured by directing my own employees to view and examine the property, and I have used this information in lieu of examination by my own employees.

Trial Examiner: Proceed.

By Mr. Goodman:

Q. Now, is it your conclusion and opinion that if the Commission should find a 7 percent rate of return to be a reasonable one for the property used and useful by Panhandle Eastern Pipe Line and Michigan Gas Transmission Company in its production and transmission of natural gas, that the excess over a reasonable return is shown by the figure of $2,986,000?

* * * * * * *

[fol. 56] Q. And is it your conclusion that if 6 percent be determined to be a reasonable rate of return for the properties used and useful by Panhandle Eastern Pipe Line and Michigan Gas Transmission Company, the excess over a reasonable return is the amount of $3,570,000?

A. That is correct, again subject to the income tax adjustment.

Q. And is it your opinion and conclusion that if a 5 percent return per annum should be found to be a reasonable rate of return for the property used and useful by Panhandle Eastern and Michigan Gas Transmission Company, the excess over such reasonable return is the amount of $4,118,000?

A. That is correct, also subject to income tax adjustment.

[fol. 57] Q. And these opinions and conclusions concerning the excess returns are based upon the operating results for the year 1940?

A. That is correct.

Q. Now, you have qualified that conclusion by the question of income tax adjustment? A. Yes.

Q. Will you explain in what direction that income tax adjustment operates?

A. That income tax adjustment would increase the excess of present earnings over the required earnings.

Q. In other words—

A. (Interposing) If the revenues were reduced by an amount somewhat greater than the amount here stated, the amount of income taxes paid would be reduced in some amount depending on the present taxable income and the taxable income under the reduced revenues; and that would be the adjustment which would have to be made in addition to this reduction referred to heretofore.

Q. Now, directing your attention, Mr. Toeppen, to the figures which follow line 5, under the general caption, "Annual requirement for depreciation, depletion, amortization of and return on utility plant,"—"Annual rate of return, 5 percent,"—"Requirement 6.51 percent"—do you follow me? A. I do.

[fol. 58] Q. Now, will you explain how it is that a requirement for return, depreciation, depletion and amortization equal to 6.51 percent of the cost of the property will yield an adequate depreciation, depletion, and also a return of 5 percent?

A. It is the nature of interest, and of compound interest, that when you recover an investment through a number of years, that a small increment, being the rate of interest above the return requirement, will, throughout a series of years, recover the investment and provide a return on the unrecovered remaining part of the investment. For a 30-year life, this annual requirment amounts to 6.51 percent, of which, during the first year of life, 5 percent would go for return, and 1.51 percent for recovery of investment; during the succeeding years, the amount required for return would decrease as the investment is recovered, and in the last year, only 1/105th of the 6.51 percent would be interest, and the remainder of the 6.51 percent would be return on the unrecovered portion, with a constantly changing ratio during the intervening years.

Q. Now, looking at the figure of 8 percent, you indicate a requirement for depreciation, depletion, amortization,

and return equal to 8.88 percent of the first cost of the property.

A. That is correct.

Q. And is the same principle which you mentioned? [fol. 59] A. It is.

Q. Now, Mr. Toeppen, you have covered it, but I just want to make sure that it is emphasized or covered,—now, suppose that we put into this picture of a recovery of return, recovery,—that is, the yield of return and recovery of adequate amortization, depreciation, depletion,—at any point in its life history. Now, will such an income yield of 8.88 percent upon the first cost at any point in the life history yield 8 percent on the value of the property, all other conditions remaining the same, assuming that there is no change in value other than the depreciation which is being constantly recovered or the depletion which is being recovered?

A. That is correct. Possibly I can give a specific example of those relations.

Mr. Wheat: May the record show the name of the volume from which the witness is now reading?

Mr. Goodman: It will.

Trial Examiner: The record should show such reference.

The Witness: I am consulting a table, or publication, entitled "Engineering valuation" by Marson and Agg, published in 1936, and am on page 646.

Mr. Culton: Who is the publisher?

The Witness: McGraw-Hill.

(Continuing)—on page 606, in the bottom table, with the subheading "21-30 years probable life", in the last [fol. 60] column, "30 years",—let us go to it, and, by the way, this is an 8 percent table, as stated on the top of page 606,—let's go to the fifth year where the property is shown to have a value of 94.82 percent of the cost new at the beginning of the year, and of 93.52 percent at the end of the year, or a depreciation of 1.30 percent. Then, in that year, 1.30 percent of the 8.88 percent will be needed for depreciation, leaving 7.58 percent as an 8 percent return on the 94.82 percent value at the beginning of the year;

By Mr. Goodman:

Q. In other words, you assert the conclusion that 8.88 percent, under the conditions stated as to the expected life, will yield throughout, conditions other than the assumptions remaining unchanged, a return of 8 percent on the value as constantly depreciating throughout the years?

A. That is correct.

Q. Now,—

Trial Examiner: (Interposing) Is your testimony involving depreciation based on a company policy of these companies?

The Witness: The company policy, I think, is not clearly set forth in any manner that I have been able to ascertain. They have shown various appropriations in the registration statements, but there is no definite commitment as to the continuation of that policy.

Trial Examiner: What are your assumptions as a basis [fol. 61] for the depreciation testimony?

The Witness: My assumptions are that, based upon their statement as to the probable life in the field of 25 years from 1940, and an age of 8 years to 1946; there will be a total life of 33 years to the enterprise, and to allow for additions since 1932 and for the fact that they are depreciating or amortizing certain contracts on a 10-year basis, I have assumed a 30-year average life of the property in question.

Trial Examiner: What depreciation method did you follow?

The Witness: I have used the recovery of the investment on a compound interest basis during the life of the enterprise and return on the unrecovered investment. It is equivalent, and as a matter of fact, it is the basis of the often-used, so-called sinking fund method which is not, in truth, a sinking fund method, by which equal results may be obtained under the treatment I here use, and which is similar to that which prevails, for example, in connection with the paying off of a mortgage on your house in equal monthly installments during the life of the mortgage, where the monthly payment is divided into unequal

amounts and constantly changing amounts between return on unrecovered balance of the mortgage and the recovery of the mortgage.

Trial Examiner: Your method, then, is essentially the same as used by the California regulatory commission?

[fol. 62] The Witness: The answer is the same, although I do not go through the fiction of a sinking fund allocation; the answer is exactly the same as if you would use a sinking fund approach and use as your annual depreciation, the sinking fund allowance plus the accrued interest on the sinking fund.

Trial Examiner: Excuse the interruption, Mr. Goodman,—proceed.

By Mr. Goodman:

Q. Now, Mr. Toeppen, by using a percentage requirement like for 5 percent,—6.51 percent of the first cost,—I take it that it is not intended to vary the income yield, that is to say, the amount for return and depreciation, throughout the period?

A. As long as circumstances and conditions justify the 5 percent rate of return, the 6.51 percent will not change; if circumstances and conditions justify a change in the rate of return, then naturally the annual requirement will change.

Q. In other words, making the theoretical calculations, it is assumed for purposes of completion, or conformity to theory, that the 6.51 percent is an equal annual return throughout the life?

A. No, not a return, but a recovery which is divided between recovery of investment, and return on unrecovered investment.

Q. Right. Now, will you tell me why an assumption of [fol. 63] equal annual return is essential?

A. Because the cubic foot of gas which you will sell in the last year of operation of this property and the one you sell in the middle year and the one you sell in the first year are of equal value to the customer.

Q. In other words, for the purpose of setting up the calculation as you see it now, there is no difference in value for the annual delivery of service as between the first year and the last, is that right?

A. Or at any intermediate year.

Q. Therefore, they should sell for the same amount, is that right?

A. That is correct.

Q. Assuming the continuance of the same conditions?

A. Right.

Q. Now, you are familiar with the theory of depreciation known as the straight-line theory, which, in the proper application of the theory, depreciates the value of the property from the initial amount in equal annual amounts? A. I am.

Q. Now, if you were to take an item of property having an initial value or cost of $100 and a life of 10 years, and for the sake of convenience, it has no salvage, what would the requirement for depreciation and return be, for the first year?

[fol. 64] A. On a straight-line basis?

Q. On a straight-line basis.

A. On the assumption that you could reconcile the straight-line basis, which is fundamentally the case of a compound interest or sinking fund treatment, at zero percent return, with a result of return which is inconsistent in itself, I suppose you would make that reconciliation, —then, the requirement for a 10-year life will be 10 percent to depreciation and—what rate of interest?

Q. Six percent.

A. And a 6 percent rate of interest would be 6 percent for the return, making it 16 per cent for return and depreciation during the first year.

Q. Well, now, let us suppose, then—

A. (Interposing) For the sake of simplicity, put it on a $100 basis, and that would be 10 per cent or $10 for depreciation, and 6 per cent or $6 for interest, making a total for return and depreciation of $16.

Q. Now, let us suppose that we had confidence in that theory and we then, at the end of the first year, had a remaining value of $90 and proceeded to use the $90 as a rate basis. What then would the requirement be on that assumption for the depreciation and return during the second year?

A. You would need 10 per cent, or $10, of the first cost as depreciation, and 6 percent of the remaining value

[fol. 65] of $90, or $5.40 for a return, making a total of $15.40, as compared with $16 for the first year.

Q. Now, what is wrong with the picture?

A. Well, the older the property got, the cheaper you would buy your gas.

Q. Right, or if you were delivering goods in freight cars,—then what?

A. The older the railroads got, the cheaper you would get your transportation.

Q. Is that right, in your opinion?

A. I have always thought that the same service was worth the same money, no matter how old the taxicabs are, or the railroads, or anything that the riders use.

Q. Do you visualize a customer as paying less for the use of an old freight car than he would for a new one?

A. No, I do not think you could induce anyone to pay one rate for riding in a brand new taxicab and pay another rate for an old taxicab which might be sold to the junk dealer tomorrow.

Q. Would gas have a different value if it were delivered through old pipes, or new pipes?

A. No, it would do the same amount of cooking or house-heating, no matter how it got there.

Q. Is there anything more that you care to say about Exhibit No. 2?

[fol. 66] A. I think that covers Exhibit No. 2 very thoroughly.

Mr. Goodman: Please mark this paper which I present as Exhibit No. 3 for identification.

(The document referred to was marked as Exhibit No. 3 for identification.)

By Mr. Goodman:

Q. Mr. Toeppen, will you identify the paper marked as Exhibit No. 3?

A. Exhibit No. 3 is an extract from a registration statement filed by Panhandle Eastern Pipe Line Company on February 12, 1937, with the Securities and Exchange Commission, and included in their File No. 2-2867-1-1.

Q. And what comment do you make concerning the use that you made of Exhibit No. 3?

A. This exhibit, which contains a statement at the end of the second paragraph marked with double black lines

in the two margins, contains this statement: "And after giving consideration to all known factors affecting the future supply and probable demand, the Issuer will be able to obtain supplies of natural gas sufficient for its market requirements for a period of not less than 25 years."

I used this in lieu of an independent investigation of the gas reserves under the control of this company, it being their statement included in their registration statement, and I made it a part of my report and the basis of my [fol. 67] conclusion as to the life of the reserves. Incidentally, I possibly could have included with it a copy of another sheet of the registration statement which was a letter from Ralph E. Davis, Inc., engineers, of Pittsburgh, stating that they concurred in the statement made in the registration statement with respect to such reserves.

* * * * * * * *

A. (Interposing) May I add something to that, and in view of the fact that the property of the Michigan Gas Transmission Company is an integral part of the means of delivering gas to Detroit, or to customers east of Dana, Illinois,—I have used the probable life of the gas supply [fol. 68] which controls the useful life of a pipe line as measuring the probable life of both the Panhandle Eastern Pipe Line Company and Michigan Gas Transmission Company properties.

Q. Now, Mr. Toeppen, you examined the registration statement of Panhandle Eastern Pipe Line Company filed with the Securities and Exchange Commission on February 12, 1937, in File No. 2-2867-1-1, in re gas reserves?

A. That is right.

Q. And Exhibit No. 3 was secured in what manner?

A. By photostating the page marked "3" in that registration statement.

Q. And do you know that it is a true copy of the filed registration statement?

A. It is.

Q. And did you make use of the information, herein contained to develop your information concerning the probable service life of the property here in question?

A. I did; I used this information the same as if I had, at that time, had occasion to go out and engage a person

or engage the person who made up these statements, to make such a study for me, and assumed that the statements would be identical with the report made to the company.

Mr. Goodman: I offer Exhibit No. 3 in evidence.

* * * * * * * *

[fol. 69] Trial Examiner: The ruling as to the admission of this proffered exhibit will be reserved until opportunity for cross-examination has been given.

Mr. Goodman: Will you please mark this paper as Exhibit No. 4 for identification, and I have here three copies, each consisting of three sheets.

(The document referred to was marked for identification as Exhibit No. 4.)

By Mr. Goodman:

Q. Will you please identify the paper marked as Exhibit No. 4?

A. Exhibit No. 4 is a photostatic copy of pages 17 and 18 of a registration statement filed by the Panhandle Eastern Pipe Line Company with the Securities and Exchange Commission on November 13, 1940, and filed by them in File No. 2-4579-1-1.

[fol. 70] Q. What use, Mr. Toeppen, or fundamental data did you prepare from the information contained in Exhibit No. 4?

A. This exhibit is a copy of a letter from Ralph E. Davis, Inc., Engineers, Pittsburgh, to the Board of Directors of Panhandle Eastern Pipe Line Company under date of November 12, 1940, relating to the ownership of gas properties or leases or contracts in the Panhandle field of Texas, the Amarillo field of Texas, and the Hugoton field, of Kansas. My particular interest was in the items marked "A" to "G," which are Mr. Davis', or the Davis company's, conclusions as to the reserves controlled by Panhandle Eastern in these various portions of the two fields.

Mr. Wheat: Mr. Goodman, I take it that the witness, himself, added those letters, "A" to "G"?

Mr. Goodman: That is right.

The Witness: I have summarized the reserves in thousands of cubic feet, set out in the various paragraphs at the marked points,—on the third sheet of the exhibit. They total, for both fields, 2,491,977,000 thousand cubic feet, as of the date of the report, in 1940. I have then provided that by the annual capacity of the pipe line, at 100 percent load factor, using the capacity stated in the 1940 report of 250,000 thousand cubic feet per day for that purpose, dividing that 91,250,000 thousand cubic feet into the reserves, indicates a life of 27.4 years from 1940, on, [fol. 71] for the reserves under the control of the Panhandle Eastern at the time of the report.

I have used this report in the same manner as I would use a report, had I employed Davis and Company to make such a survey for me at that time.

Q. And would you have confidence, Mr. Toeppen, in the report of Ralph E. Davis, Inc., Engineers?

A. I think I would consider the employment of Ralph E. Davis, Inc., by Panhandle Eastern as a very high recommendation.

Mr. Wheat: May I ask a question, at this time?

I think, that in arriving at your calculations on the attached third page of this exhibit, No. 4 for identification, you assumed a static condition in connection with sales of gas by this company?

The Witness: I assumed, as I stated, Mr. Wheat, sales amounting to the capacity, present capacity, of the pipe line at 100 percent load factor.

Mr. Wheat: Well, did you make any assumptions with respect to the static, or otherwise, nature of the withdrawals of gas from the Amarillo and Hugoton gas fields by companies other than the defendant Panhandle Eastern Pipe Line Company?

The Witness: I assumed that Panhandle Eastern would adequately protect their proportionate right in these fields by arranging the proper withdrawals from the wells so that [fol. 72] they would have no losses by having their reserves drained by others.

Mr. Wheat: And those two statements—

The Witness: (Interposing) And I must assume that Mr. Davis' conclusions were based on the same assumption.

Mr. Wheat: Now, regardless of the Davis conclusions, to be sure how you arrived at this,—I take it, then, that you did not make any calculations based on any change in the amounts of gas withdrawn from the Amarillo field or the Hugoton field during these future years by persons other than this defendant, is that correct?

The Witness: I based my conclusions on the final paragraph of Mr. Davis' statement, where it says, "The reserves are, we believe, sufficient to meet the combined anticipated requirements for pipe line, carbon black, and other uses for a period of more than 25 years.

"The combined gas supply controlled by your company in the Amarillo and Hugoton fields is, in our judgment, adequate to supply its present markets and any reasonably anticipated increase in the gas requirements of said markets for a period of more than 25 years."

To be on a very safe side, I used a 100 percent load factor, amounting to 91,000,000, rather than—I think it is 54,000,000-odd, which the company transmitted last year.

Mr. Wheat: Well, I wonder if you would mind answer-
[fol. 73] ing the question which I asked.

The Witness: I believe I answered the question.

* * * * * * * *

[fol. 74] By Mr. Goodman:

Q. Mr. Toeppen, you considered Mr. Davis' report and statement as indicating the controlled gas areas of the Panhandle Eastern Pipe Line Company, is that right?

A. I did.

Q. Now, you then, for the purpose of your own calcu-
[fol. 75] lations, looked to the maximum possible take with the existing facilities?

A. I did.

Q. You then concluded that on the basis of Mr. Davis' statement of the control of reserves and the maximum possible take with the existing facilities, the probable life of the supply would be 27.4 years?

A. That is correct.

Q. Now, in making these calculations—and this is Mr. Wheat's question,—did you consider that some other person apart from Panhandle Eastern would increase their take in and about those fields?

A. I considered that if that condition existed, that it had been properly taken into account by Mr. Davis in his conclusion.

Q. In other words, you accepted Mr. Davis' figure of what Panhandle Eastern had under control and you did not pay any attention to the possibility that that might happen in other parts of the field, or anything else,—is that right?

A. I did pay attention to the possibility that other companies possibly might be draining gas out from under Panhandle Eastern's controlled territory: but I had to assume that, in making a statement as to the available reserves of this company, Panhandle Eastern, that Mr. Davis had made similar considerations and that his figures [fol. 76] had been properly executed for that risk, and that this was a net available to this company, according to the Davis report.

Q. All right, now, I wonder if that—

Mr. Wheat: I am sure that answers my question.

Mr. Goodman: I offer Exhibit No. 4 in evidence.

Trial Examiner: The same ruling with reference to its admission.

* * * * * * * *

Mr. Goodman: Will you please mark this paper which I present as Exhibit No. 5 for identification?

(The Document Referred To Was Marked For Identification as Exhibit No. 5.)

Mr. Goodman: I am presenting three copies of Exhibit No. 5 for identification to the Commission, and Exhibit No. 5 consists of two sheets.

By Mr. Goodman:

Q. Will you please identify Exhibit No. 5?

A. Exhibit No. 5 is a photographic copy of pages 19 and 20 of a registration statement filed by Panhandle East-

ern with the Securities and Exchange Commission on [fol. 77] November 13, 1940, and by them placed in File No. 2-4579-1-1.

Q. Will you state what use you made of Exhibit No. 5 and the information therein contained?

A. Exhibit No. 5 is a report by P. McDonald Biddison, consulting engineer, Dallas, under date of November 2, 1940, to the Board of Directors of Panhandle Eastern Pipe Line Company, dealing with various aspects of the Panhandle properties, and I paid particular attention to the second page on which I have marked the first paragraph with lines in each margin.

Q. Will you state what they amount to, Mr. Toeppen?

A. Beginning on the fourth line, there is a statement concerning the property,—"The compressor stations on the main system are carefully designed, their equipment is first class in all respects, they present a neat and attractive appearance and are maintained in excellent condition. All these features tend to produce reliability and economy of operation. The main transmission system has been constructed with a margin of safety as to pressure so that it may safely be operated at 500 pounds compressor station discharge pressure. Stream crossing locations"—

Mr. Baldridge: (Interposing) He is reading now from the report and I will have to make a statement which I have made as to the two preceding exhibits.

Now, can it be understood that if he reads it into the [fol. 78] record that it be in the record subject to being stricken out at the time the other exhibits are passed upon?

Trial Examiner: Very well, we will have that understanding.

May I ask what is the source of what you are reading? Is that part of the same exhibit?

The Witness: It is the second page of the same exhibit.

Trial Examiner: You may proceed, with that understanding.

The Witness: It is the paragraph marked with parallel lines. (Continuing):

"—Stream crossing locations have been carefully selected and multiple lines across streams so located and installed as to leave very slight probability of interruption at such locations. The transmission lines have been well located and well laid to secure stability and are carefully maintained. The main line loops completed in 1937 provide additional protection against service interruption and this protection will be enhanced by the loop extensions recently completed and by those now under construction. The Gasoline Plant at Liberal is of modern design, and the dehydration plant in connection with it is an effective preventive of interruptions of service from freezing of lines. Measuring and Regulating Stations are of up to date equipment, are carefully maintained and the stations are neat and clean. Little evidence of deterioration in the main line property can be found. Pipe exposed in making connections for 1937 and 1940 additions did not [fol. 79] indicate interior corrosion. Flow tests of the main lines in 1937 and 1938 showed some fouling or corrosion of the old lines westward from Olpe Station to Liberal Station."

Mr. Wheat: May I ask whether the witness did not make a error and say "fouling or corrosion" instead of "fouling, not corrosion"?

The Witness: It should read, "showed some fouling, not corrosion of the old lines westward from Olpe Station to Liberal Station. This condition has been effectively remedied as evidenced by subsequent flow tests and by capacity obtained under routine operations. Routine reports show little deterioration of protective coating and pitting of pipe except in a few very restricted areas. Such areas are being protected cathodically as they develop."

* * * * * * * *

[fol. 82] By Mr. Goodman:

Q. Mr. Toeppen, did you personally check the original of Exhibit 5 in the files of the Securities and Exchange Commission?

A. I read Exhibit 5 in the files of the Securities and Exchange Commission before I ordered a photostat made.

Q. And is Exhibit 5 a true copy of what it purports to be? A. It is.

Q. And the information that you pointed out, concerning the condition of the property as reported by P. McDonald Biddison, consulting engineer, and as filed with the Securities and Exchange Commission by Panhandle Eastern Pipe Line Company, did you depend upon that report?

A. I did, as if I had instructed Mr. Biddison to make a similar examination for me of the same features there reported on.

Mr. Goodman: I offer Exhibit 5 in evidence.

Trial Examiner: The ruling on admission will be deferred until the completion of cross-examination.

[fol. 83] By Mr. Goodman:

Q. Now the figures which you have used and the conclusions which you have drawn are predicated upon reported cost figures, are they not? A. They are.

* * * * * * * *

[fol. 85] By Mr. Goodman:

Q. Mr. Toeppen, have you made any allowance in the figures specifically for going value as a separate item?

[fol. 86] A. No.

Q. Will you state why you did not?

A. The figures for cost of gas plant and for costs of other plants as summarized in the annual reports of the Panhandle Eastern Pipe Line Company and Michigan Gas Transmission Company purport to be in accordance with the system of accounts for natural gas companies described by the Federal Power Commission and that system of accounts requires and, therefore, I must assume that the reports report the actual disbursements for material, labor, services and all other elements entering into the construction of the properties of these two companies.

These costs, in the first place, are costs of these materials, labors, services, easements, and so on, on the open market and are costs for merchantable goods, that is, goods capable of being sold and resold as goods of their own particular character, that is a ton of pipe is bought as a ton of pipe and can be used for any purpose whatsoever or sold again as a ton of pipe. Labor of various grades, ditch diggers, welders, truck drivers and all the other forms of labor are bought as unapplied labor which

can be applied to the company to any purpose whatsoever or possibly at the time sublet to others, for use in other performances of other duties, services of engineers, superintendents and others who are similarly free to be used [fol. 87] anywhere prior to the construction of this property and they are used in assembling this merchantable material into an operating gas transmission property and gas-producing property and they are assembled in view of their prospective future earning ability, either estimated in view of the cost of the thing and its prospective revenues or in view of the prospective revenues and a justifiable total cost.

When the property represented by the recorded cost has been assembled from the constituent merchantable materials and unapplied labor into the operating gas transmission and gas-producing property it no longer has values as separate items of merchantable material or merchantable labor and services, it has a value only as an operating gas property. It cannot be recovered or valued as at the current price of its component materials, labor and services as merchantable commodities.

If it were not operated as a gas transmission and gas-producing property, it would have only a merchantable cost equal to the recoverable junk value of the material; the labor used in assembling and the labor used in supervising and engineering the property would be irretrievably lost and its value as a non-operating property would be only junk, far less than the cost as reported in the records of the company.

The difference between the amounts reported as ex- [fol. 88] pended for merchantable material and merchantable labor and merchantable services and the junk value of the property now recoverable is the going value of the enterprise.

Mr. Goodman: I present for identification and hand to the Commission three copies of a paper which I request be marked Exhibit 6 for identification.

(Document referred to was marked Exhibit 6 for identification.)

By Mr. Goodman:

Q. Will you please identify the paper marked Exhibit 6?

A. This is a calculation designed to show the estimated operating expenses and taxes during 1940 on the assumption that the system were operated at a hundred percent load factor and at capacity.

Q. Now, you wanted to make a little correction on one of the figures there, did you?

A. I do. In the last column in the first line, it should read 84 instead of 81 and the line entitled—

Trial Examiner: (Interposing) Eighty-four thousand instead of eighty-one thousand?

The Witness: Yes. In the line entitled "Total Natural Gas Production" it should read 226,000 instead of 223,000. In the line "Total," it should read 926,000 instead of 929,000—

. . . . . .

[fol. 90] By Mr. Goodman:

Q. Now, reserving the right to substitute a corrected Exhibit 6, will you proceed to state the general result shown by the exhibit?

A. In this exhibit I undertake to estimate along very broad lines the probable cost of conducting operations in 1940 if the system had delivered 91,250,000 cubic feet' instead of 54,116,525 that it did handle. I should say "transmitted" rather than "delivered," because this is an import.

I did that by increasing those items expensed which were more or less directly related to the quantity of gas transmitted by the ratio of the 54,000,000,000 cubic foot to the 91,000,000,000 cubic foot which is a ratio of 1.686.

For the item, "Net Credit for Residuals Produced," I used only one-half of that ratio because I did not have the details of the operation of the recovery plant and there would be some constant expenses in that item. That is the only one where I modified the ratio. On that basis the operations in 1940 would have amounted to 6,476,000 instead of 5,719,301 that they did amount to for the two companies together.

Q. Mr. Toeppen, state whether you developed in this exhibit, Exhibit 6, that if this company were to operate at its capacity with the existing facilities, of course, and constantly, it would result in annual operating costs of [fol. 91] $6,476,000?

A. Approximately that amount.

Q. Yes. And do you show the quantity of gas that would be delivered annually at that cost?

A. Not the quantity delivered, but the quantity which would be fed into the system.

Q. Yes.

A. Some of that would be used in transmission and the small amount would be unaccounted for.

Q. And what is that figure?

A. 91,250,000 cubic feet.

Q. And what is the significance of the two figures which I mention, namely, the expense of $6,476,000 and the quantity of gas which you mentioned?

A. Those figures, by themselves, as yet have no significance. They must be combined with the requirements of the capital investment for return and depreciation.

Q. Yes, but what does it lead up to, anyway?

A. It leads up to the cost of supplying gas under 100 percent load factor condition.

Q. Now, will you state whether or not that would be an ideal object to attain?

A. That is what any company operating a property of this kind would like to attain, if they possibly could.

Q. In other words, it utilizes their full capacity?

[fol. 92] A. It does, just like the hotel keeper would like to have all the rooms in his hotel rented every night.

Mr. Goodman: With the privilege of substituting for correction of figures, I offer Exhibit 6 in evidence.

Trial Examiner: The ruling on admission will be reserved until the completion of cross-examination.

Mr. Goodman: I present three copies of a paper which I request be marked Exhibit 7 for identification.

(Document referred to was marked Exhibit No. 7 for identification.)

By Mr. Goodman:

Q. Will you please identify the paper marked Exhibit 7?

A. Exhibit 7 is a compilation continuing the compilation of Exhibit 6 to reduce the operating cost, plus depreciation and return requirements, to a cost per thousand cubic foot of gas. In it I start with the figure from Exhibit 6 of $6,476,003, which is, again, a correction from the figure shown and I add to it the requirements determined in Exhibit 2 for depreciation and return in the amounts there shown in the third group of lines ranging from 11,230,000 corrected, to 11,778,000, corrected, 12,362,000 and 12,961,000 as the amounts acquired for operating expenses, depreciation and return on the bases shown at 100 percent load factor and capacity use of pipeline.

. . . . . .

[fol. 93] Mr. Culton: There are not enough exhibits to go around. Does that assume 100 percent load factor?

The Witness: It does.

Mr. Culton: During the entire life of the plant?

The Witness: Yes.

Dividing these amounts by the 91,250,000 cubic feet, we arrive at a necessary price of 12.3 cents for a 5 percent return, 12.9 cents for—

Mr. Baldridge: (Interposing) If Your Honor please, may I reserve my objection to be ruled on at the same time?

Trial Examiner: You may.

Mr. Wheat: We should like to have the same ruling.

Trial Examiner: Yes, you will have ample opportunity to cross-examine on these exhibits before they are received in evidence.

The Witness: (Continuing) —12.9 cents for a 6 percent return, 13.6 cents for a 7 percent return and 14.2 cents for an 8 percent return on the basis of gas delivered to the transmission system; on a basis of the gas delivered to customers the figure would be slightly higher to allow

for gas used in transmission and for gas used as gas un-
[fol. 94] accounted for.

Mr. Culton: May I inquire, you say transmission to customers. Do you mean customers of the distributing company or customers of the pipeline company or customers of the Michigan Gas Transmission line?

The Witness: I mean customers of the Consolidated Pipe Line System.

Mr. Culton: Two?

The Witness: Right.

Mr. Culton: You refer, then, to the customers as being the city distributors?

The Witness: Yes, sir.

Mr. Culton: And not the ultimate consumer?

The Witness: Not the ultimate consumer.

Mr. Culton: O. K.

The Witness: This would be the city gate rate.

By Mr. Goodman:

Q. I take it that if the Panhandle Eastern Pipe Line Company and Michigan Gas Transmission Company, together, were to make a price of 14.2 cents per thousand cubic feet of gas and if, as a result of that price, they were to achieve 100 percent load factor they would, in your judgment, be earning 8 percent upon the book cost of their property?

A. They would be earning 8 percent upon the remain-
[fol. 95] ing cost of their property.

Q. Yes.

A. Subject to the adjustment of that 14.2 cents for the difference between gas put into the system and gas delivered to customers.

Q. Well, of what magnitude would that adjustment be in general?

A. Very small. It should not exceed probably 5 percent.

Mr. Goodman: I offer Exhibit 7 in evidence.

Trial Examiner: The ruling on admission will be deferred. It is understood, again, that the substituted Exhibit 7 will be brought in.

The Witness: Yes.

Mr. Goodman: Yes.

I present a paper and hand up three copies and I request that it be marked Exhibit 8 for identification.

(Document Referred To Was Marked Exhibit No. 8 For Identification.)

By Mr. Goodman:

Q. Will you please identify Exhibit 8?

A. Exhibit 8 is an estimate of the probable revenue and income if the system were operated at capacity, 100 percent load factor and the Michigan Consolidated Gas Company rate were applied to all the sales without adjustment [fol. 96] for the difference between the gas put in and gas delivered.

The Michigan Consolidated schedule rate gives a cost of .0275 dollars or two and three-quarters cents per therm at 100 percent load factor. This is equal to 26 cents per thousand cubic foot as calculated.

Applying this to the 91,251,000 cubic feet will give a revenue of $23,725,000. Deducting the $6,476,000, which is a correction against the $6,473,000 written here determined in the previous exhibit, will leave $17,249,000 for depreciation, depletion, amortization and return without correcting for income tax changes which is at the rate of 23.6 percent on the average cost new of the property in 1940.

. . . . . .

[fol. 97] By Mr. Goodman:

Q. You mean, Mr. Toeppen, that if the gas company were to sell all of its gas substantially at the same fundamental contract price as they sell to Michigan Consolidated Gas Company, namely demand charge of 38 cents per therm per month, measured as they measure it under that contract, and a commodity charge of one cent and a half per therm the return will be approximately 23.6 percent per year if they have 100 percent capacity operations and 100 percent load factor?

A. That is correct, subject to the adjustment for the difference in gas measurements put in and taken out and subject to the income tax correction.

Q. Yes.

Mr. Culton: May I ask another question in connection with that table? What did you consider to be the 100 percent load factor, daily, for the 365 days in the year from the beginning of the plant?

[fol. 98] The Witness: I will calculate this on the basis of the present plant and the present operation.

Mr. Culton: All right, but what did you consider to be the present 100 percent load factor which was the basis for your tabulation?

The Witness: Two hundred fifty thousand thousand cubic feet a day.

Mr. Culton: Two hundred fifty million cubic feet a day, in other words?

The Witness: Yes.

Mr. Culton: And what day was that ever produced?

The Witness: I used your stated capacity in your annual report.

Mr. Culton: That is what you consider as the load factor, is it?

The Witness: I consider that as the capacity of the line.

Mr. Culton: All right.

The Witness: And a hundred percent load factor means operate at rated capacity of a device continuously.

Mr. Goodman: I offer Exhibit 8 in evidence.

Trial Examiner: The ruling on admission will be reserved.

By Mr. Goodman:

Q. In your general experiences, as outlined, dealing [fol. 99] with your work and studies of proper rates for various public utilities, have you had occasion to give consideration to the fair rate of return? A. I have.

Q. Will you state the factors which you deemed proper to be considered in developing a fair rate of return?

A. The factors involved in the determination of a fair rate of return are first of all the risks to which the business is subject and the way in which the costs incident to the incurrence of those risks are dealt with and then after each risk has been taken care of, either specifically or generally, the return on a risk, less investment at that time. The risks of a business may be taken care of in two ways, they may be either commuted into a current cost or they may be allowed to fall into the return which is not specifically distributed as a cost. For example, you have the choice as to whether you will run the risk of the burning down of your home or of the property you are leasing and renting to others and take all of the rent as a return or you may buy fire insurance and decrease your return and avoid the risk of losing your investment.

Q. In other words, the process of insurance means the purchasing of certainty at a cost?

A. It does. This is practiced in many, many phases of utility business or other business generally and in the [fol. 100] gas production and transmission business as well as in other business.

Q. Well, would you care at this time to mention some of the risks incurred in the conduct of a business which are secured or converted or commuted into certainties at a cost or relative certainties?

A. Yes, for example, in Exhibit 5, I think it was, in Mr. Biddison's report, there are statements as to the manner in which this pipeline and the stations were constructed to avoid the risks of interruption to service. Here the risks of interruption and the risk of continuance of return have been commuted into a capital cost rather than being allowed as a part of the return.

The company, after it has once constructed its pipeline, does not leave it subject to the mercy of the elements but inspects it and maintains it and repairs it continually, thereby converting the risk of its failure due to wear and tear into a cost of operation.

The company pays social security insurance, which is one means of stabilizing its labor relations and preventing interference with its operation through failure of labor

supply and it also, I can assume I believe, pays a rate of wages which will attract a competent and reliable personnel rather than paying minimum wages and running the risk of interruption to service from the low wage rate that [fol. 101] they would pay under those conditions.

It, insofar as is applicable, carries appropriate fire insurance either outside or through a self-insurance provision and I have no occasion to check, but it is reasonable to assume that they carry the usual public liability and employee liability insurance to minimize or commute the costs incident to those risks of employee or public injury or to defalcation of employees handling funds.

Q. Now speaking generally, Mr. Toeppen, is it a frequent incidence that risks are taken care of or commuted by costs and the claim is made that they still exist as risks, when it comes to consider the rate of return?

A. That is frequently done, because the relation between inclusion of cost of meeting risks or accruing for meeting of risks, say in the form of insurance, is in their minds not associated with the level of the rate of return applicable to the risks remaining after those provisions are made.

Q. What is the effect so far as the resultant quantum of risks is concerned of a public utility following the general and usual prescribed forms of accounting in regard to its expenses and maintaining adequate reserves in accordance with the usual prescriptions?

A. If those reserves and provisions, and they are not in the form of reserves because many are either by capitaliza- [fol. 102] tion as I pointed out at an adequate improved rate of construction—

Mr. Culton: (Interposing) Are you talking about this company now?

The Witness: I am talking about this company, yes. I had reference to Exhibit 5 in which Mr. Biddison reported on the high grade of construction and special care taken in river crossings and other practices to prevent interruption to service.

Mr. Baldridge: I take it your comment does not apply to Michigan Gas Transmission Corporation?

The Witness: The comment is not based upon this specific case, but a parallel based upon my general acquaintance with the practices of corporations generally is that all such proper and justifiable provisions are made and I believe have been made in the case of Michigan Gas Transmission Company.

. . . . . .

[fol. 103] Mr. Goodman: I present a paper consisting of three sheets and I request that it be marked Exhibit 9 for identification. I am handing three copies to the Commission.

(Document referred to was marked Exhibit No. 9 for identification.)

By Mr. Goodman:

Q. Will you please identify the paper marked Exhibit 9?

A. Exhibit 9 is a statement setting forth the nature of the factors affecting the nature and magnitude of the report of net incomes.

. . . . . .

[fol. 104] Q. Does Exhibit 9 state the major factors which you have considered in coming to your conclusion as to the proper rate of return? A. It does.

Mr. Goodman: I present a paper which I request be marked for identification as Exhibit 10 and I am handing three copies to the Commission.

(Document referred to was marked Exhibit No. 10 for identification.)

By Mr. Goodman:

Q. Will you please identify the paper marked Exhibit 10?

A. Exhibit 10 is a tabulation to show the effect of variation in accounting practices on reported incomes of an enterprise.

. . . . . .

[fol. 105] Q. The figures on Exhibit 10 and the example is offered merely for illustrative purposes, is it not?

A. It is.

Q. Is it necessary to make any explanation?

A. I think the exhibit speaks for itself, that the manner in which you account for certain costs determines the magnitude and character of the rate of return which is to be allowed in considering the enterprise.

Q. Is there any further comment that you care to make as to the bearing of the example in Exhibit 10 on the general subject of rate of return?

A. Yes, there is this: That if one company accounts for its incomes in a manner similar to Plan A, it will be justified in asking for a higher rate of return than if it accounts for them under Plan B where it has commuted all its risks or many of its risks to an expense rather than [fol. 106] to be met out of the return allowed in the rate-making procedure.

Mr. Goodman: For the purposes mentioned, I offer Exhibit 10.

Mr. Wheat: Holding the ruling open on that, Mr. Examiner, may I ask one question for clarification?

Trial Examiner: Surely.

Mr. Wheat: Do I understand that it was your previous testimony that Panhandle Eastern Pipe Line Company reports and that you assume that it reports to this Commission on the basis of the general accounting practices which have been set up by this Commission for natural gas companies?

The Witness: I do.

Mr. Wheat: Well, under Plan A or Plan B is it prepared?

The Witness: There is a latitude of choice left under that system of accounts and the company reports, as far as I can discover from the annual reports, partially on Plan B and partially on Plan A. Certain provisions for risks which are in many companies treated as an operating expense before the determination of gross income are by this company treated as a deduction from gross income.

Mr. Wheat: On Exhibit 10, the only difference is in the item of insurance, is it not?

The Witness: Or other provisions against risk.

[fol. 107] Mr. Wheat: On Exhibit 10 the only difference is in the item of insurance, is it not?

The Witness: "Insurance and so forth," I may point out which covers all other forms of risk which have been commuted or may be commuted.

Mr. Wheat: That is the only "and so forth" on the whole exhibit, isn't it?

The Witness: Correct. That is the entire point I want to make, Mr. Wheat, that if you commute risks into costs to insurance or insurance-like processes in which I include inclusion of incurred actual expense either of actual disbursements to meet matured risks or accruals to meet future risks then you have a different treatment in the way of a rate of return than if you don't make such provisions in operating expenses.

Mr. Wheat: Well, whatever point you want to make, what does Panhandle Eastern Pipe Line Company do with respect to "and so forth" on Exhibit 10?

The Witness: I have stated that as far as I can discover from the annual reports it splits its treatment. For example, the provision for uncollectible bills is apparently made out of income and not as an operating expense.

Mr. Wheat: You do not know that, do you?

The Witness: I have consulted the registration statement and I say the figures therein show that it is ap-[fol. 108] parently treated as a deduction from income.

Mr. Wheat: Do you know whether or not that is true?

The Witness: Only insofar as the registration statement speaks for itself.

Mr. Wheat: What other items are covered under your theoretical "and so forth" under Exhibit 10 in reference to Panhandle Eastern Pipe Line Company?

The Witness: I cannot tell you because we have not had a detail operating expense statement of the company. I am only offering this to indicate that consideration must be given the treatment by the company, whatever it may be must be reflected in determining the rate of return allowable.

Mr. Wheat: Now, Mr. Toeppen, in the item of insurance, what does the Panhandle Eastern Pipe Line Company do that is not proper under the system of accounts of the Federal Power Commission?

The Witness: I did not say they did anything which was not proper. I said a latitude of choice was offered them as how certain costs are treated under that system.

Mr. Wheat: Well, what does it do, then, that makes it pertinent to your purported Exhibit 10?

The Witness: I made no statement as to what Panhandle Eastern does, I simply say that the question of what is done which is not fully determinable from the annual reports has a bearing on the magnitude of the rate of [fol. 109] return to be allowed.

* * * * * * * *

By Mr. Goodman:

Q. Have you been able to make any analysis, Mr. Toeppen, of the size of the provision for identifiable risks in operating costs in relation to the size of the investment of Panhandle Eastern Pipe Line Company and Michigan Gas Transmission Company?

A. I have not, sir.

Q. And why have you been unable to do so?

A. The operating expense statement included in the [fol. 110] annual report as filed with this Commission is not in sufficient detail to permit identification of specific provisions for risks and association with the particular investment concerned in that risk.

Q. Will you illustrate how different maintenance practices of companies engaged in the same business following the same accounting practice may affect the value of any comparison of their respective net earnings as shown by their books?

* * * * * * * *

[fol. 111] By Mr. Goodman:

Q. Will you illustrate how different maintenance practices of companies engaged in the same business and following the same accounting rules may affect the value of any comparison of their respective net earnings as shown by their books?

A. One company may make all necessary repairs very promptly and, you might say, even in advance of serious deterioration of its property and thereby prevent the need of large replacements at a later date. Another company may choose to let maintenance accumulate and make its repair through a replacement of a major unit rather than by constant repairs prior to the stage at which a replacement must be made. The one would show a high maintenance cost and the other would show a low maintenance cost, but the first one would have a low depreciation requirement and the second one would have a high depreciation requirement.

Q. And what would you say about variances in the depreciation policies as affecting the real returns and the [fol. 112] proper rate?

A. If a company uses either a so-called retirement policy of treating depreciation or the straight line method of providing for depreciation, its reported operating results will be distorted from those which would prevail on the basis of using a proper depreciation provision in my testimony today.

If it used a straight-line method, its earnings during early days, that is when the property was of an age less than half of its life, it would be understated because excessive provisions for depreciation had been made in those years and during the latter half of its life, its earnings would be overstated because not sufficient provision was being made on a retirement basis, also a distortion would occur, being overstated in earlier years, the depreciation being understated and the profits overstated in the earlier years.

Q. Now, have you taken into consideration the effect upon risks in general due to inadequate maintenance policies or whatever they may be or depreciation policies which is created by the use of the particular service life which you have applied?

A. I don't quite understand your question.

Q. Well, in other words, do you expect that there is some risk here of the property wearing out?

[fol. 113] A. As far as the major part of the property is concerned, I should judge from Mr. Biddison's report that

the property will not wear out prior to the exhaustion of the gas supply.

Q. So that when you use the service life which you have applied here, what does that allowance do toward eliminating various risks?

A. It, you might say, brackets all the risks which would tend to mature at a point beyond the life adopted. In other words, if there is a risk which would destroy this property in 40 years, that risk is practically excluded by the controlling risk that the field would fail in 30 years. The estimations are paralled, not cumulative, and the shortest controls.

Q. So that, when you were using for property of this character a service life of 30 years, is there reasonable certainty that that 30-year income that we have figured upon is in sight?

A. If it were not, then the investments made in the pipeline would have been ill advised.

Q. Well, what do you think as to whether or not a 30-year income is in sight?

A. According to the reports which I have introduced in evidence which are, I take it, by the fact that they were made on behalf of the Panhandle Eastern Pipe Line Com- [fol. 114] pany, made by competent engineers, there is a supply of over 30 years from the inception of the program in sight.

Q. Now, in what manner does the use of the 30-year life affect the question of probable obsolescence of gas as a fuel?

A. I don't quite—

Q. (Interposing) Well now, suppose that somebody were to present an argument that other types of fuel utilization may be discovered in the future through scientific research, to what extent is that question or speculation answered by the statement that "Well, we are only figuring on 30 years"?

A. If that condition can't be expected to materialize before the 30 years are up, it is of no consequence.

Q. Now, conditions of progress in the arts and so forth, just how are they, are the risks of depreciation due to them eliminated by using a short life like the 30 years?

A. Using a short life avoids the risks of improvement which may appear after 30 years and leaves you faced only

with those that would occur during the immediate 30 years.

Q. In general, what would you say concerning the existence of any risk of obsolescence or lack of customer demand in the commodities supplied by the companies under regard here?

[fol. 115] A. I don't foresee any within the estimated additional 25 years of life.

Q. Now, Mr. Toeppen, can you say anything about the probable survival of utility to this property beyond the 30-year period which you used?

A. There are two factors that come in there. The first one [illegible] to whether or not this gas supply will last longer than 30 years. Mr. Davis makes no statement as to reserves beyond the 25 years from 1940 which underlies the 30-year estimate from inception of the company.

It is not customary in those reserve calculations to make the most extreme assumptions as to the available gas. There may be some more in addition to what Mr. Davis gave as an estimate to be in the present reserves. There may be additional large areas in the western part of the Mississippi Valley which have not yet been discovered. The discovery of gas in the western part of the Mississippi Valley has been going on for very, very many years. We don't know what else we may find.

If gas should give out in the area there is in that same eastern slope of the Rockies a substantial deposit of oil shales through Colorado, Wyoming and possibly farther south and if there is no more gas, there would probably be sufficient economic urge to exploit the oil shales for production of both gas and oil which can be transmitted [fol. 116] through this same pipeline.

There is another alternative, that either in the West or in the Middle West after the gas supply fails there will be manufactured gas production at mine mouth which can be economically distributed through this pipeline system in view of its then salvage value.

Q. Now, are you able, in view of all considerations which you have mentioned as being applicable, to form an opinion concerning the degree of risk or the comparison

of risk applicable to Panhandle Eastern Pipe Line Company and Michigan Gas Transmission Company in respect to their ability to yield adequate depreciation and reasonable earnings within the stated period?

A. As compared with what?

Q. With anything you wish to form some comparison, say, possibly with the risk of rate return.

A. Certainly there are some unprovided for risks which do not exist in the country as a whole in business. In other words, the entire country's business has a great diversity as to risk distributions and any one particular industry in the country will have a greater inherent risk than all the enterprises in the country together and, therefore and further, all the enterprises of the country together and their chance of survival and their relation to conditions in the country as a whole is, possibly, reflected [fol. 117] in the yield on U. S. Treasury bonds and notes. The risk of Panhandle Eastern and Michigan Gas Transmission is certainly one which is greater than a risk of the country as a whole and, therefore, the rate of return would be greater than this quasi risk less rate of U. S. Treasury bonds and notes of equal maturity.

Q. Well now, how would it compare with other businesses and would you express a comparison in terms of figures for the rate of return?

A. Well, for example, it is probably more risky than the venture of the American Telephone & Telegraph Company. It operates in a limited territory as compared to the nation-wide operation of American Telephone & Telegraph Company. It is probably even more risky than a large electric light and power company such as Consolidated Edison of New York or Commonwealth Edison of Chicago. It is not as risky as a straight oil producing company or a straight gas producing company.

Q. Have you given any consideration to the ability of a concern like Panhandle Eastern to secure financing and the costs of money to it?

A. I have not.

Mr. Goodman: I present a paper which I will ask to have marked for identification as Exhibit 11. I am handing three copies to the Commission.

[fol. 118] (Document Referred To Was Marked Exhibit No. 11 For Identification.)

By Mr. Goodman:

Q. Will you please identify the exhibit marked 11?

A. Exhibit 11 is a chart showing the relation between yields of various United States Treasury securities and the life from the date of the quotation on which the yield is based to call date as during October 1939 and as based on a publication of the U. S. Treasury Department setting forth the average prices and average yields of all the outstanding issues during the month of October 1939.

Q. Did you prepare the exhibit?

A. It was prepared under my direction.

Q. And will you characterize its substantial purport?

A. This chart shows that yields vary more or less directly with the length of time to maturity or call date and that immediate maturities, that is maturities less than about a year and a half, at that time were sold at such a premium as to yield no return and that beginning at a year and a half the return increased gradually to about slightly over 2.5 percent for maturities over 17 years.

Mr. Goodman: I offer Exhibit 11 in evidence.

Trial Examiner: The ruling will be reserved.

Mr. Goodman: I present a paper and ask that it be marked Exhibit 12 for identification. I am handing three [fol. 119] copies to the Commission.

(Document Referred To Was Marked Exhibit No. 12 For Identification.)

By Mr. Goodman:

Q. Will you please identify Exhibit 12?

A. Exhibit 12 consists of five sheets relating to the yields of U. S. Government Securities in the interval from the quotation date of July 6, 1941 to maturity. It is based on information contained in the financial page of the "New York Times" for July 6 and is as of July 5. The yield rates are taken directly from the "New York Times" tabulation, a photostat of which is page 3 and the length of time to maturity was calculated by myself.

The information as to the time of call was calculated by myself and the information as to call dates was secured from the U. S. Treasury Department.

The second page contains the same information for the U. S. Treasury notes taken from the same source and the first chart is the graph of presentation of the information on the first and second sheets and was prepared personally by me and shows that immediate yields of about nine months or less again are negative and increase gradually [fol. 120] with increasing remaining life of the investment with slightly over 2 percent at 17 years.

The last chart is a similar chart drawn from similar sources prepared in the same way and by myself as of February 7, 1940 from information which I used in another case and brought in here simply to show the general continuance of conditions during that recent period.

By Mr. Goodman:

Q. Now, Mr. Toeppen, isn't it a fact that Exhibit 12 shows, in general, risk less rates of return which apparently varied dependent upon the length of maturity?

A. They do. They are not quite riskless, Mr. Goodman, they are subject to what might be called the integrated risks of the country as a whole.

Q. Now, how do the present yields from U. S. bonds compare with yields from the same securities in other years?

A. Very, very much lower.

Q. Could you refer to any date as a basis of comparison? A. You have a chart on that.

Mr. Goodman: I wish to offer Exhibit 12 in evidence.

Trial Examiner: The ruling will be deferred.

Mr. Goodman: I present a paper which I request be marked Exhibit 13 for identification.

(Document Referred To Was Marked Exhibit No. 13 For Identification.)

[fol. 121] By Mr. Goodman:

Q. Will you identify Exhibit 13?

A. Exhibit 13 is a chart showing the history of yields of U. S. Government securities from 1920 to date for maturities, for additional lives, remaining lives of five, ten, fifteen and twenty years from the date, during the month from which this yearly yield was calculated. It is calculated for only two months in each of the years.

The calculation was carried out under my direction and supervision and shows that these yields in March of 1921 were all in excess of 5 percent for all lives of investment and have declined, not uniformly, but consistently from then to the present date.

The lines of the chart stop with February 7, 1940 and I have inserted beyond that four dots showing the yields for five, ten, fifteen and twenty-year lives as of the July 5 quotation under Exhibit 12 which yields seem to be almost the lowest that have occurred since 1921.

Mr. Goodman: I present a paper which I request be marked for identification Exhibit 14.

(Document Referred To Was Marked Exhibit No. 14 For Identification.)

[fol. 122] By Mr. Goodman:

Q. Will you please identify the paper marked Exhibit 14?

A. Exhibit 14 is a computation in which I take yield rates from Exhibit 12 and the chart for July 5, 1941 as read from the curve on that chart for one year, two years and so on for maturities to 30 years and average them at an equal weight which shows that if you have a serially maturing investment, maturing in equal, annual installments, each installment yielding the return at the time of acquisition, shown on the July 5 chart of Exhibit 12, that you will obtain an average yield of 1.66 percent over your 30 years investment.

. . . . . .

[fol. 123] By Mr. Goodman:

Q. Do you have any opinion, Mr. Toeppen, concerning what would be a fair rate of return for a utility such as Panhandle Eastern Pipe Line Company and Michigan Gas Transmission?

. . . . . .

A. Yes.

Q. What is it?

A. It is a figure somewhere in excess of this 1.66 percent of Exhibit 14 and covering a range rather than a specific amount.

In view of the incomplete information concerning the treatment of certain specific risks, by these companies, [fol. 124] I would say it would run probably somewhere between 4.5 or 6 or 6.5 percent.

Q. You mean that it is your opinion and judgment that a return as high as 6.5 would be clearly adequate and a return as low as 4.5 might be adequate?

A. That is correct.

Mr. Goodman: That is all and that is our case.

There is one other question I would like to ask.

By Mr. Goodman:

Q. Mr. Toeppen, you have not made any attempt to make an apportionment of any available reduction to Michigan Consolidated Gas Company? A I have not.

Q. Why have you not done so?

A. For two reasons, first of all, if such an apportionment were to be made more information than was presently available would be necessary.

Secondly, I believe that with the type of enterprise that we have here, that is an integrated utility serving a large number of customers, rather say an integrated plant serving a large number of customers, each one which is essential to the success of the entire venture, the cost to the system as a whole is the cost to every customer and there is no apportionment necessary.

Q. Well now, assuming that this Commission would [fol. 125] adopt as a fair rate of return 6 percent, how would you suggest that the reduction entailed thereby should be distributed?

A. I would suggest that the gate rate for every distributing customer be set at an amount per thousand cubic foot arrived at by dividing the amount in Exhibit 2 in the line entitled "Total Requirement at 6 Percent Per Annum

Return of $5,362,000," by the proper number of cubic feet, preferably the cubic foot at 100 percent load factor.

Mr. Lee: Cubic foot sold you mean?

The Witness: Cubic foot sold, yes.

Mr. Goodman: That is all, Mr. Toeppen.

[fol. 146] Mr. Baldridge: It is suggested that that part of Mr. Clark's statement with respect to affiliations and similar matters, that begins at line 2 on page 44 of the record and reads as follows: "Under that contract, if and when carried out, Michigan Gas Transmission Corporation is to be sold by Columbia Gas & Electric Corporation to Panhandle Eastern Pipe Line Company at cost. Panhandle Eastern is to have the right to acquire from Columbia Gas & Electric Corporation other connecting pipe lines in Indiana for approximately $355,000. These would constitute all of Columbia Gas & Electric Company's lines in Indiana." be revised to read as follows: "Under that contract, if and when carried out, Michigan Gas Transmission Corporation and a small distributing company, which is likewise a subsidiary of Columbia Gas & Electric Corporation, are to be sold by Columbia Gas & Electric Corporation to Panhandle Eastern Pipe Line Company at cost and at the same time Panhandle Eastern Pipe Line Company will purchase other connecting pipe lines in Indiana belonging to another subsidiary of Columbia Gas & Electric Corporation for approximately $355,000. These would constitute all, or substantially all, of the gas pipe lines in Indiana owned by subsidiaries of Columbia [fol. 147] Gas & Electric Corporation."

Trial Examiner: Thank you for this statement and I am going to ask that Release No. 2778 of the Securities and Exchange Commission, being the opinion and order of May 27, 1941 in matters relating to the Panhandle Eastern, et al, as amended by Release No. 2834, the Securities and Exchange order of June 21, 1941, come into the record as Exhibit 15.

I have asked that copies be obtained of this. I think that we should have this data in the record.

Mr. Gorman: If the Examiner please, I have obtained extra copies of the release of May 28 which I have in my office and will be glad to make available if anyone so desires.

Trial Examiner: The order of the Commission of June 21 is equally important because there are corrections made in the original order, so at your convenience, Mr. Gorman, if you will furnish those we will treat them as Exhibit 15.

(Exhibit No. 15 was received in evidence.)

* * * * * * * *

[fol. 270] (Exhibits Nos. 1 to 14, inclusive, were received in evidence.)

* * * * * * * *

[fol. 337] C. H. M. BURNHAM was produced as a witness by and on behalf of Panhandle Eastern Pipe Line Company, and being first duly sworn, testified as follows:

Direct Examination.

By Mr. Wheat:

Q. Where do you reside?

A. Kansas City, Missouri.

Q. Are you employed by Panhandle Eastern Pipe Line Company?

A. Yes, I am Chief Engineer of Panhandle Eastern Pipe Line Company.

I graduated from Ohio State University with a degree of Bachelor of Mechanical Engineering in 1916. In 1929 I was granted a professional degree of Mechanical Engineer by the same university.

* * * * * * * *

[fol. 338] In 1916 I went to work for the Ohio Fuel Supply Company, Columbus, Ohio. This company later became a subsidiary of Columbia Gas and Electric Corporation. It was engaged at that time, and, as I understand it, is now engaged, in the transportation and wholesaling of natural gas from Ohio and West Virginia fields. My early work with that company was as a draftsman, during which period I designed compressor stations and gaso-

line plants, gas measuring stations, and similar structures used in the natural gas industry.

In 1920 I became Construction Engineer for the same corporation. My time was largely engaged in supervising the designing and construction, as I said before, of compressor stations, natural gasoline plants, gas measuring stations, and pipe lines.

In 1925 I joined the organization of Henry L. Doherty & Company, New York City, with headquarters in Colo- [fol. 339] rado as Chief Engineer of the Colorado-Wyoming Gas Company, a Cities Service subsidiary. As Chief Engineer of Colorado-Wyoming Gas Company, I supervised the design and construction of its system, which extends from Denver, Colorado to Cheyenne, Wyoming. This is a natural gas pipe line system with all the usual appurtenances of such a line.

In addition to my duties as Chief Engineer of Colorado-Wyoming Gas Company, I collaborated on numerous occasions with the organizations of the other natural gas subsidiaries of The Cities Service Company in the Midcontinent and in the Appalachian fields. This collaboration was concerned largely with the construction of long distance natural gas pipe lines, compressor stations, and special problems involved in measuring and transporting natural gas.

In 1930 I was commissioned to make a study of the feasibility of building a natural gas pipe line from the Transylvania fields of Roumania to Vienna, Austria and Budapest, Hungary. In connection with this study, I spent approximately three months in Roumania, Hungary and Jugoslavia.

In 1936 I made a similar survey relative to a natural gas supply for Mexico City, Mexico. In the summer of 1936 [fol. 340] I went to California as Chief Engineer of the Coast Exploration Company, a subsidiary of Federal Water Service Corporation, organized principally to engage in the exploration for natural gas in California.

In 1937 I joined the organization of Panhandle Eastern Pipe Line Company, and have been employed continuously by that company since that date.

Q. Now, Mr. Burnham, will you describe your duties as Chief Engineer of Panhandle Eastern Pipe Line Company?

A. I have general supervision of the engineering activities engaged in by this company, including the construction of all new gas transmission facilities.

Q. Does this include the designing of facilities as well as their construction?

A. It does. My duties also include that of being familiar with all of the property owned and operated by this company, including its gathering line system, its gasoline, dehydration, and compressor stations, its pipe lines, its gas measuring equipment, and all other items of plant and equipment.

In 1938 I was assigned the job of testing the lines and equipment of this system in order to determine its safety at five hundred pounds working pressure. That particular job took me from one end of the system to the other, during which time I was able to observe not only the plant construction, but much of the pipe used in the construction of the system.

[fol. 341] In 1939 a program of increasing the flow efficiency of some of our lines was carried out under my direction. In this connection I designed (and later patented) a gas pipe line "go devil" for cleaning internally large diameter pipe lines. I might add here that the fouling in our lines was determined by test to be present only on the west end of the system and consisted of dirt, principally sand, included in the line at the time of construction.

. . . . . .

This device consists of a ten-inch diameter by approximately four-foot segmented steel body having attached to it by means of leaf springs four rows of metal-backed steel brushes. Three roller bearing wheels are mounted on springs at each end to carry the weight of the device. These wheels are set tangentially to impart to the "go-devil" a spiral motion necessary to distribute the wear on the steel brushes and to obtain complete scrubbing of the [fol. 342] interior surface of the pipe.

In operation, the "go-devil" is placed in the line, and (by admitting gas behind it), is propelled through gate-to-gate sections of the line at a speed varying from twelve to fifteen miles an hour. As it progresses through the line the steel brushes loosen the dirt which, carried by the gas passing through and around the "go-devil," is blown ahead and out of the line. By means of this device we were able to restore a great many miles of our line to a clean condition and thus more nearly assure ourselves of full and unobstructed flow of gas through these sections.

Q. Have you anything to add, Mr. Burnham, to your description of your experience and duties as Chief Engineer of Panhandle Eastern Pipe Line Company?

A. Nothing other than the fact that we are extremely busy at the moment engaged in a construction program which involves the expenditure of some nine million dollars. We hope that this program will be largely completed by January 1, 1942.

Q. Is this work you have mentioned largely a continuation of the general program of this company to completely loop its pipe line system?

A. It constitutes that, and also the extending of our lines to new markets.

. . . . . .

[fol. 345] By Mr. Wheat:

Q. Now, Mr. Burnham, let me ask you to what you refer when you use the expression "Panhandle Eastern Pipe Line System"?

A. I not only refer to the pipe lines, compressor stations and other property owned by Panhandle Eastern Pipe Line Company, but also to the properties of a wholly-owned subsidiary, Illinois Natural Gas Company, which owns lateral lines in the State of Illinois.

According to the company's records, the construction [fol. 346] of the company's original line was commenced in the yea. 1930. The major part of the construction was completed in 1931, although service was not rendered on any considerable scale until the next year, 1932.

Q. Will you please state the length of the original line?

A. The total length of the original line was 859.4 miles. It includes the section of 22-inch pipe in Texas and Oklahoma, to a point in Kansas near the Liberal station.

The system today consists of 2,788 miles of varying sizes of pipe, including loop lines, lateral lines and gathering lines. Through this system the company serves, directly or indirectly, some 200 cities and communities having an aggregate population of upwards of three million persons.

Q. Please name some of the principal cities and communities so served?

A. Detroit, Monroe and Ann Arbor, Michigan; Fort Wayne, Muncie and Kokomo, Indiana; Champaign, Urbana, Peoria, Springfield, Jacksonville and Quincy, Illinois; Hannibal and Jefferson City, Missouri.

[fol. 347] The company's system includes 12 main line compressor stations and three small local area stations to which I shall refer later. It also includes a large gasoline plant, for the extraction of gasoline from the natural gas as it comes from the wells. The system also includes two dehydration plants which are used for the purpose of removing moisture from the natural gas, in order to render it possible to transport the gas through the pipe line without danger of freeze up. In addition, the system has 629 measuring and regulating stations, together with numerous warehouses, camps, and various types of auxiliary structures.

Q. Now, Mr. Barnham, I would like to have you state the principal sources of supply of natural gas of this company?

A. Panhandle Eastern Pipe Line Company secures its supply of natural gas from two principal sources, the so-called Panhandle Field of Texas and the so-called Hugoton Field of Southwestern Kansas. In the former field gas is obtained from 110 wells and in the latter from 137 wells.

Approximately fifty per cent of the gas secured from both the Panhandle and Hugoton gas fields is purchased by the company and the balance is produced from the [fol. 348] company's wholly-owned or partnership wells.

At the present time approximately 70 per cent of the company's annual requirements are taken from the Texas

Panhandle Field and the remaining 30 per cent comes from the Hugoton Field.

In the Texas Panhandle Field the gas is gathered from the various wells through varying sizes of pipe lines ranging from 4 to 22 inches in diameter and having a total length of about 125 miles. The gas thus gathered is brought into the Sneed Compressor Station where it is compressed and dehydrated by means of a glycol dehydration plant located on the same site. The gas is then carried northward through the Hansford, Texas, Compressor Station to the compressor station at Liberal, Kansas, a dis- [fol. 349] tance of some 105 miles, where it is mixed with the gas which has been gathered from the Hugoton gas field. The gathering system in the latter field consists of approximately 250 miles of various sizes of pipe lines ranging from 2 to 18 inches in diameter. At the Liberal Station, the natural gasoline is removed from the gas by an oil absorption plant, after which the mixture of Kansas and Texas gas is dehydrated in a second glycol plant and is thus made ready for transportation to the markets lying to the northeast. I might add that the natural gas, as it leaves this Liberal dehydration plant, is dry and sweet, and that it possesses a heating value of approximately 1000 BTU per cubic foot, and is in marketable condition.

. . . . . .

[fol. 350] Q. Mr. Burnham, I wish you would explain, briefly what is shown on Exhibit 15, for identification.

A. This map shows the entire transmission, and lateral pipe line system of Panhandle Eastern Pipe Line Company and includes in different colors, as shown on the "legend" in the lower right-hand corner of the map, not only the main line construction, but also the loop construction made during the year 1937, which is shown in [fol. 351] red; the loop construction done during 1939 and 1940, which is shown in green; the new construction now in progress, which is shown in dotted purple lines; and also roughly the pipe line system of the Michigan Gas Transmission Corporation, which is shown by a heavy dashed blue line, commencing at the Illinois-Indiana boundary and running easterly and northeasterly from that point to the city of Detroit, Michigan.

I might add that the section of the Michigan Gas Transmission System between Muncie and the Ohio line is not properly shown there on that map. As I understand it, that section of the line does not belong to the Michigan Gas Transmission Corporation.

* * * * * * *

Q. And have you also shown on this map, Exhibit 15, for identification, the various compressor stations of the Panhandle Eastern Pipe Line Company?

A. I have. The compressor stations originally constructed on the Panhandle System are shown by dark [fol. 352] blue squares; those constructed in 1936 are shown by yellow squares; the one constructed in 1937 by a red square; and the one constructed in 1940 by a green square.

Q. This map apparently shows, Mr. Burnham, that the gas obtained by the company in the Panhandle Field of Texas comes to the Sneed Compressor Station through two distinct gathering line systems; is that correct?

A. Yes, that is correct. It is to be noted that gas which this company obtains in the Panhandle Field is produced in two general areas, one being in the northeast Potter, northwest Carson, southwest Hutchinson, and eastern Moore Counties. This gas, after being gathered through smaller pipe lines is moved through an 18-inch pipe line to a point some two and one-half miles southwest of the Sneed Compressor Station, where a junction is made with a 20-inch pipe line bringing gas from the other general area in the Panhandle Field from which the company obtains gas, that is, the south central Moore County area lying generally west and southwest of this junction. A 22-inch line leads from this junction to the Sneed Compressor Station.

Q. Mr. Burnham, have you in this connection prepared, or had prepared under your direction, a map showing generally the gathering pipe line systems of the Panhandle Eastern Pipe Line Company in the Panhandle and also in [fol. 353] the Hugoton Gas Fields? A. I have.

Q. Is the map which I now show you, Mr. Burnham, a copy of the map to which you have just referred?

A. It is.

Q. Was this map prepared by you or under your direction? A. Under my direction.

Q. And do you believe that it correctly shows what it purports to show? A. I do.

* * * * * * *

Trial Examiner: It will be marked Exhibit 16 for identification.

* * * * * * *

Q. Now, Mr. Burnham, does the map which has been marked Exhibit 16 for identification show, in somewhat greater detail than Exhibit 15 for identification the gathering lines in the Panhandle Field to which you have just been testifying? A. It does.

Q. Would it be correct to state that all of the wells, which are shown as connected to the Panhandle Eastern gathering system in Texas by lighter solid lines on Exhibit [fol. 354] 16 for identification, belong to Panhandle Eastern Pipe Line Company?

A. That is true, except for two wells which belong to the Navajo Production Company, from which Panhandle Eastern purchases gas at the wells in Texas.

* * * * * * *

As is fully shown on the Exhibit, the Panhandle Eastern Pipe Line Company's gathering lines in the Hugoton Field are much more extensive than are its gathering lines in the Panhandle Field. They also draw gas from a much larger area. This gathering system in the Hugoton Field, as is shown on the map, consists generally of two main arms extending westerly and northwesterly from the compressor station located at Liberal, Kansas. The branch which extends due west from Liberal some 37 miles consists of a 16-inch pipe. At a point about four miles west of the town of Hugoton, Kansas, one branch, consisting of 12-inch and thereafter 8-inch pipe, extends in a southwesterly direction, while another branch, consisting of 8-inch pipe, extends in a northwesterly direction.

The other main arm of the Kansas Hugoton Field gathering system consists of an 18-inch pipe line gradually reducing to 8 inches and extending some 50 miles in a north- [fol. 355] westerly direction from the Liberal station. At a point on this line, about 26 miles from Liberal, a 16-inch

branch extends in a westerly direction, and thence a 10-inch line or branch in a southwesterly direction connecting with the 8-inch line from the arm first described.

* * * * * * * * *

Q. Does the Panhandle Eastern Company also purchase some gas in the Hugoton Field?

A. Yes, in addition to taking gas from its own wells in that field, Panhandle Eastern purchases approximately 60 per cent of its total requirements in that area from other producers. I should add that on the map of the gathering system, connecting lines joining the gathering pipe lines to wells which are shown by solid lines represent pipe lines owned by Panhandle Eastern, while dotted lines from wells to the gathering lines represent gathering pipe line systems owned by other producers who sell gas to Panhandle Eastern.

* * * * * * * * *

[fol. 356] Commencing at Windmill Junction, in Moore County, Texas, where the two main lines of the company's Texas Panhandle gathering system join, near the Sneed Compressor Station, a 22-inch O. D. by 11/32-inch wall, Lapweld, single random length pipe line extends 2.69 miles to Sneed Compressor Station. This line is a composite, welded and coupled line with a Dayton coupling every third joint.

* * * * * * * * *

From the Sneed Station to Hansford Station, a distance of 51.5 miles, the same type of material and construction I have just mentioned was used.

* * * * * * * * *

At Sneed Compressor Station we are just coming out of what is known as the Canadian River breaks, a badly eroded country typical of the area covered by the south branch of our Texas gathering system. Aside from a few small canyons the country from Sneed to Hansford is fairly level. There are some wheat fields here, but grazing of cattle predominates.

* * * * * * * * *

[fol. 357] From Hansford Compressor Station to the Beaver or properly called the North Canadian River in Oklahoma, there are .67 miles of 22-inch O. D. by 11/32-inch wall, Lapweld, single random length pipe and 13.56 miles of 22-inch O. D. by 5/16-inch wall, single, random length pipe. This pipe is also joined with a Dayton coupling every third joint. At the Beaver River, the line branches through the use of headers and gate valves into five 10-3/4 inch O. D. by .307-inch and .365-inch wall thickness, double random length, seamless pipe lines, solid welded, and weighted with river clamps. These multiple lines extend across the river bed for a distance of 1.01 miles. The total quantity of pipe in this river crossing is 26,680 feet.

* * * * * * *

From the north header on the Beaver River crossing, the line extends 37.98 miles to the south header of the Cimarron River crossing in Kansas. This section of line consists of 22-inch O. D. by 5/16-inch wall, single random length, Lapweld pipe with a Dayton coupling every third joint. The Cimarron River crossing consists of five 10-3/4 inch O. D. by .365-inch wall, seamless, double random length pipe, solid welded lines across the bed of the river for a distance of .71 miles and weighted with numerous river clamps. The total quantity of pipe in this river crossing is 18,804 feet.

* * * * * * *

[fol. 358] From Hansford to the Beaver River, the line runs through grazing country similar to that between Sneed and Hansford. At the Beaver River, we come to the great wheat growing area of the Oklahoma Panhandle. Almost solid wheat fields extend to a point near Liberal Station where we come into the breaks of the Cimarron River. This is near the center of the dust bowl of the Southwest.

Q. Does the loop line system of this company's pipe line commence at the Liberal Station?

A. Yes, and in describing the main transmission line from this point easterly, I should like to describe separately both the original line and the loop line between each compressor station. I should like to add that when mention is made of the fact that every second or every third

joint is made with a coupling, it is also meant, without ex-
[fol. 359] ception, that the intervening joint or joints are welded.

* * * * * * * *

The original line from Liberal Station to Greensburg Station, a distance of 86.72 miles, consists of 24-inch by 5/16 inch wall, electric weld pipe in 40-foot lengths. All coupled type of construction was used, meaning a coupling every 40 feet.

* * * * * * * *

Total length of the loop between Liberal and Greensburg is 63.31 miles.

* * * * * * * *

[fol. 360] The line from Liberal Station progresses through rough eroded country for a short distance then emerges onto the plain between Cimarron and Arkansas Rivers. Between Liberal and Greensburg Stations the crops are principally wheat and kafir corn. Due to the proximity of the dust bowl, dust storms are common in this area.

* * * * * * * *

From Greensburg Station to Haven Station, the original line consists of 59.7 miles 24-inch O. D. by 5/16-inch wall, double random length, electric weld pipe with Dayton coupling on each joint and 26.24 miles 24-inch O. D. by 5/16-inch wall, 30-foot average random length, seamless pipe with a coupling on each joint.

* * * * * * * *

[fol. 361] Total length of this loop is 65.67 miles.

* * * * * * * *

Beginning at Greensburg the line is built through some 20 miles of shifting sand hills. It is here that considerable difficulty is experienced keeping the line covered. After emerging from the sand hills the line procesds through a swampy area for a number of miles. Here the line is held down by means of numerous anchors.

* * * * * * * *

[fol. 362] As I have said, the distance from Haven Station to the West header of the Arkansas River crossing is 4.08 miles. The original line for this distance is of 24-inch O. D. by 5/16-inch wall, seamless pipe with a coupling every joint. At the Arkansas River the original line branches out through the use of headers and valves into six 10-3/4 inch O. D. by .307-inch seamless, solid welded lines constituting the submerged crossing for this river. The distance from header to header across this river is 1.2 miles and the total quantity of pipe used in building this crossing was 38,130 feet.

From the east bank of the Arkansas River, the original line is constructed for a distance of 17.1 miles of 24 inch O. D. seamless pipe with a coupling every 30 feet. From this point to Olpe Compressor Station, a distance of 70.28 [fol. 363] miles, the original line is constructed of 24-inch O. D. by 5/16-inch wall, electric weld pipe with a coupling every joint.

. . . . . .

[fol. 364] Near Haven Station the line is in the flood plain of the Arkansas River. Upon emerging it runs through 30 to 40 miles of good farming country to a point near Burns, Kansas, where we encounter the Flint Hills of central Kansas. Here for a distance of some 30 miles the line is laid in solid rock. As for farming, the Flint Hills are unsuitable for anything but grazing lands. Near Olpe Station the line runs out of the Flint Hills and the balance of this section of line is built through fairly good farming country.

. . . . . .

From Olpe Compressor Station to the west header of the Neosho River, the original line extends for a distance of 9.99 miles and is constructed of 24-inch O. D. by 5/16-inch wall, double random length, electric weld pipe with a coupling every 40 feet. At this header, the original line branches into two 18-inch O. D. by 5/16-inch wall, solid [fol. 365] welded lines and on the bank of the stream the two 18-inch lines branch into six 10-3/4-inch O. D. by .365-inch seamless lines laid under the bed of the stream to a point beyond the opposite bank, where double 18-inch

welded construction is again used to the east header. The total quantity of 18-inch pipe used in this crossing is 33,955 feet, and the total quantity of 10-inch pipe is 6,797 feet, and the total distance from header to header is 3.43 miles.

From the east header of the Neosho River to the west header of the Osage River, the original line extends for a distance of 52.81 miles and is constructed of 24-inch O. D. by 5/16-inch wall, double random length electric weld pipe with a coupling every 40 feet. At the west header of the Osage River crossing, the 24-inch line branches into two 18-inch O. D. by 11/32-inch wall, solid welded, seamless lines which at the west bank of the stream branch into six 10-3/4-inch O. D. by .365-inch, seamless lines which are buried under the bed of the river and which extend to a point on the east side of the river where similar double 18-inch construction is again used. The total distance from header to header at this river is 1.37 miles and the total quantities of pipe are 9,463 feet of 18-inch O. D. by 11/32-inch wall, solid welded, seamless pipe, and 14,919 feet of 10-3/4-inch O. D. by .365-inch solid welded seamless pipe.

[fol. 366] From the east header of the Osage River to Louisburg Compressor Station, the original line extends for a distance of 18.28 miles and is constructed of the following materials:

.19 miles 24-inch O. D. by 5/16-inch wall, double random length electric weld pipe with a coupling every 40 feet;

17.99 miles 24-inch O. D. by 5/16-inch wall, hammer weld pipe with a coupling every 30 feet, and

.1 mile of 22-inch O. D. by 5/16-inch wall, single random length, Lapweld pipe with Dayton coupling every third joint.

. . . . . .

The loop-line-out of Olpe Compressor Station extends from the station to the west header of the loop line Neosho River crossing for a distance of 10.05 miles and is constructed with the following materials:

.16 miles 24-inch O. D. by 5/16-inch wall, double random length, electric weld pipe with coupling every second joint.

9.9 miles 24-inch O. D. by 9/32-inch wall, double random length, electric weld pipe with coupling every second joint.

At the west header of the Neosho River crossing, the line divides into two 18-inch O. D. by 3/8-inch and 9/32-inch wall, double random length, solid welded seamless lines which extend across the river for a distance of 3.42 miles to the east header where the two 18-inch lines converge into a 24-inch line.

[fol. 367] From this point, the loop line extends for a distance of 45.61 miles parallel to the original line and consists of the following:

.22 miles 24-inch O. D. by 5/16-inch wall, double random length, electric weld pipe with Dresser coupling every second joint.

37.14 miles 24-inch O. D. by 9/32-inch wall, double random length, electric weld pipe with Dresser coupling every second joint.

8.25 miles 24-inch O. D. by 0/32-inch wall, double random length, seamless pipe with Dayton coupling every second joint.

The total length of the Olpe loop is 59.08 miles.

* * * * * * * * *

From Olpe to Louisburg the line runs through rolling country dotted with many farms. The principal crops are wheat and corn. The Osage and Neosho Rivers, as I just stated, are in this section and fairly rough going is encountered at several other spots.

* * * * * * * * *

From Louisburg Compressor Station to Houstonia Compressor Station, a distance of 73.45 miles, the original line is constructed of 22-inch O. D. by 5/16-inch wall, single [fol. 368] random length, Lapweld pipe with Dayton coupling every third joint.

* * * * * * * * *

The total length of the Louisburg Loop is 63.31 miles.

. . . . . .

From Louisburg to Houstonia Compressor Station we have rolling wooded lands well drained and highly suited for general farming. Mixed crops are raised. There are also some orchards.

. . . . . .

[fol. 369] From Houstonia Compressor Station to the west header of the Lamine River Crossing, the original line extends for a distance of 18.51 miles and is constructed of 22-inch O. D. by 5/16-inch wall, single random length, Lapweld pipe with Dayton coupling every third joint. At the Lamine River the original line branches into two 16-inch O. D. by .284-inch wall thickness, solid welded lines which, in turn, branch into six 10-3/4-inch O. D. by .365-inch solid welded lines which are submerged under the river. On the east bank the six 10-inch lines converge into two 16-inch lines which, in turn, converge into a single 22-inch line. The total distance from header to header at the Lamine River is 1.16 miles and the total quantities of pipe used are as follows:

6,951 feet of 16-inch O. D. by .284-inch, single random length, Lapweld pipe, and

15,977 feet of 10-3/4-inch O. D. by .365-inch wall thickness, double random length seamless pipe.

. . . . . .

[fol. 370] From the east header of the Lamine River Crossing to the west header of the Missouri River Crossing, the original line extends for a distance of 15.24 miles and is constructed of 22-inch O. D. by 5/16-inch wall, single random length, Lapweld pipe with a Dayton coupling every third joint. The Missouri River Crossing of the original line is constituted of six 10-inch submerged lines requiring a total of 27,543 feet of 10-3/4-inch O. D. by .365-inch wall, double random length, seamless pipe. This crossing is solid welded, weighted with numerous river clamps and extends for a distance of .87 miles from header to header.

From the east header of the Missouri River Crossing to Centralia Compressor Station, the length of the original line is 35.45 miles and it is constructed of 22-inch O. D. by 5/16-inch wall, single random length, Lapweld pipe with a Dayton coupling every third joint.

. . . . . .

[fol. 371] Q. What about the loop line between the east header of the Lamine River Crossing to the Missouri River?

. . . . . .

[fol. 372] A. The total length of this loop is 55.59 miles.

. . . . . .

Between Houstonia and Centralia Stations the line proceeds through typical Missouri farm lands. It is principally rolling country with many farms and orchards. The Missouri River with its broad flood plain is in this section.

. . . . . .

From Centralia Station to the Mississippi River, the original line extends for a distance of 63.41 miles and is constructed of 22-inch O. D. by 5/16-inch wall, single random length, Lapweld pipe with a Dayton coupling every third joint. The Mississippi River crossing is constituted of two components; first, the 22-inch line on the Champ Clark Bridge; second, a double 12-inch submerged crossing. On the Champ Clark Bridge, the quantity of pipe used is .53 miles of 22-inch O. D. by 3/8-inch wall, single random length, Lapweld pipe solid welded and reinforced for the entire distance across the bridge. At the east end of the bridge the 22-inch line divides into two 18-inch O. D. by 5/16-inch wall, single random length, Lapweld lines solid welded for a distance of 7.17 miles where they converge into a single 22-inch line. This 22-inch line terminates at Pleasant Hill Compressor Station [fol. 373] and is but .04 miles long and is constructed of 22-inch O. D. by 5/16-inch wall, double random length, Electric Weld pipe with coupling every second joint.

. . . . . .

The submerged crossing of the Mississippi River has a total length of .92 miles and is constructed of 9,713 feet of 12-3/4-inch O. D. by .375-inch wall, double random length, seamless pipe solid welded and weighted with river clamps. Its east header is tied into the original line with 720 feet of 22-inch O. D. by 5/16-inch wall, double random length, Electric Weld pipe with Dresser coupling every second joint, and 2,330 feet of 20-inch O. D. by 5/16-inch wall, double random length, Electric Weld pipe with Dresser coupling every second joint.

* * * * * * * * * *

The loop line out of Centralia Compressor Station is constructed of the following pipe:

.09 miles 22-inch O. D. by 5/16-inch wall, double ran-
[fol. 374] dom length, seamless pipe with Dresser coupling every second joint.

40.77 miles 22-inch O. D. by 9/32-inch wall, double random length, seamless pipe with Dresser coupling every second joint.

6.16 miles 24-inch O. D. by 9/32-inch wall, double random length, seamless pipe with Dayton coupling every second joint.

Total length of this loop is 47.02 miles.

* * * * * * * * * *

From Centralia to the Mississippi River the line is on high rolling ground interspersed with farms. Fire clays are found in abundance here. Mixed farming is the practice in this area. The approach to the Mississippi River on the west side is down over steep bluffs and along the water's edge to the points of crossing. As I stated before, we have a submerged crossing here as well as a line on the Champ Clark bridge. From the east bank to Pleasant Hill Station the line runs through a low flat flood plain.

* * * * * * * * * *

[fol. 375] From Pleasant Hill Compressor Station to the Illinois River, the original line extends for a distance of 19 miles and is constructed of 22-inch O. D. by 5/16-inch wall, double random length, Electric Weld pipe with cou-

pling every other joint. On the west bank of the Illinois River the original line divides into five 10-inch lines constituting the submerged crossing, which consists of:

12,916 feet 10-¾-inch O. D. by .365-inch, double random length, seamless pipe solid welded and weighted with numerous river clamps.

On the east bank of the river, the 10-inch river lines converge into two 18-inch lines. These lines are built of 18-inch O. D. by 5/16-inch wall, solid welded pipe and converge into a single 22-inch line at a distance of 2.66 miles from the river. The total length of the Illinois River crossing is 3.15 miles. From the end of the double 18-inch on the east side of the Illinois River to Glenarm Compressor Station the original line extends for a distance of 48.52 miles and is constructed of 10.17 miles of 22-inch O. D. by 5/16-inch wall, double random length, Electric Weld pipe with coupling every other joint, 38.35 miles of 22-inch by 5/16-inch wall, single random length, Lapweld pipe with coupling every fourth joint.

. . . . . .

[fol. 376] The Pleasant Hill loop is divided into two sections. The first section lies between Pleasant Hill Compressor Station and the Illinois River and is constituted of .39 miles of 22-inch O. D. by 5/16-inch wall, double random length, seamless pipe with a Dresser coupling every second joint, 18.75 miles 22-inch O. D. by 9/32-inch wall, double random length, seamless pipe with a Dresser coupling every second joint. The second section of the Pleasant Hill loop extends from the east side of the Illinois River, parallels the original line for a distance of 23.87 miles, and consists of the following pipe:

10.82 miles 22-inch O. D. by 9/32-inch wall, double random length, seamless pipe with Dresser coupling every second joint.

[fol. 377] 13.05 miles 24-inch O. D. by 9/32-inch wall, double random length, seamless pipe with a coupling every second joint.

The total length of the Pleasant Hill loop, including both sections, is 43.01 miles.

. . . . . .

Beginning at Pleasant Hill Station the line proceeds through some very hilly country cut up with deep ravines which nature of country extends to the Illinois River. The country from the Illinois River eastward to Glenarm Station is more level and is generally good farming land. Some drain tiles are encountered in this area.

. . . . . .

Through this area, the farms are flat, the soil is not of such a nature as to give good drainage, and the farmers have put in numerous drain tiles. We cut those lines during the construction, and, needless to say,—well, I might say they are quite a nuisance. They have to be repaired, and even a year or two later the farmers require us to come back, and make complaint in case the drainage is not complete for their farm land.

. . . . . .

[fol. 378] From Glenarm Compressor Station the original line extends for a distance of 8.37 miles to the west header of the Sangamon River, more properly the south fork of the Sangamon River crossing, and for this distance is constructed of 22-inch O. D. by 5/16-inch wall, double random length, Electric Weld pipe with a coupling every 80 feet. The Sangamon River crossing consists of a submerged crossing employing five 10-inch lines. The quantity of pipe used was 5,315 feet of 10-¾-inch O. D. by .365-inch wall, double random length, seamless pipe, solid welded and installed with numerous river clamps and the total distance from header to header in this crossing is .2 miles.

Beginning with the header on the east side of the Sangamon River, the original line continues as a 22-inch line and runs for a distance of 46.64 miles to a point where the size is reduced to 20 inches. This 46.64 miles of line is constructed of 22-inch O. D. by 5/16-inch wall, double random length, Electric Weld pipe with coupling every other joint. From the 22-inch by 20-inch swedge to Tuscola Compressor Station is a distance of 14.31 miles and the line is constructed of 20-inch O. D. by 5/16-inch wall, single random length, Lapweld pipe with a coupling every fourth joint. The loop line out of Glenarm Compressor Station consists

[fol. 379] of 17.15 miles of 22-inch O. D. by 5/16-inch wall, double random length, seamless pipe with Dresser coupling every second joint, and 16.37 miles 24-inch O. D. by 9/32-inch wall, double random length, seamless pipe with Dayton coupling every second joint. The total length of the loop out of Glenarm Station is 33.52 miles.

. . . . . .

Beginning at Glenarm Station and extending to a point just east of Decatur are more rolling farm lands. However, between this point and Tuscola Station and extending on to the Illinois-Indiana State line is a great section of the black rich corn land for which Illinois is famed. The land is heavily tiled and the crops are principally corn and soy beans.

. . . . . .

[fol. 384] Q. Will you please describe the type of the original and loop lines in that section?

A. The original line from Tuscola compressor station to its terminus near the Illinois-Indiana State line, a distance of 44.03 miles, is constructed of 20-inch O. D. by 5/16-inch wall, single random length, Lapweld pipe with coupling every fourth joint. The loop line out of Tuscola compressor station, which extends for a distance of 23.79 miles parallel to the original line, is constructed of 20-inch O. D. by 9/32-inch wall, double random length, seamless pipe with Dayton coupling every second joint.

Q. Mr. Burnham, have you now described the entire main natural gas pipe line of Panhandle Eastern Pipe Line Company, including both the original and the loop line?

A. I believe I have.

Q. What portions of these main pipe lines are protected against corrosion by protective coating on the pipe?

A. All, except the 10-inch pipe in the Cimarron River, the 10-inch and 18-inch pipes in the Arkansas River, the 18-inch pipe in the Neosho River, and the 10-inch pipe in the Osage, Lamine and Illinois submerged river crossings.

. . . . . .

[fol. 385] Q. And was this coating applied when the lines were installed? A. It was.

Q. In addition to such coating, have any other means been taken to protect any portions of this main pipe line system against corrosion?

A. Yes, at some thirteen points on the system we have installed cathodic units of various types in order further to protect the pipe by electrical means.

. . . . . .

Q. What in general is the depth at which the main pipe lines are placed in the ground?

A. A minimum of thirty inches of cover has been employed in all instances in the construction of the pipe lines [fol. 386] which I have been describing. At numerous points, particularly at rivers or creek banks, the pipe line is laid much deeper under the surface of the soil and these river and creek banks are protected with riprap of stone or other materials. In order further to protect the back fill, the company has made numerous installations of breakers and spillways throughout the length of the line.

. . . . . .

It has been found, particularly where the line traverses swamps or unstable ground, that anchors are necessary, and numerous anchors have been installed at these points to prevent the pipe floating. These anchors are concrete or of steel expansion type, depending on soil conditions.

Q. Does the main pipe line system which you have described include gate valves with by-pass or blow-off connections?

A. Yes, at intervals of every eight or ten miles along [fol. 387] the pipe line, there are installed 24 inch, 22 inch or 20 inch main line gate valves with by-pass and blow-off connections. These block gate valves are used for sectionalizing the line.

Q. Will you state what you mean by the term and whether it is a procedure normal to the operation and maintenance of natural gas pipe lines?

A. Yes, it is such a procedure and it consists of closing the block gates at either end of the section to be isolated. The blow-offs are then opened to the atmosphere, and, as soon as the pressure has been relieved, the section can be safely uncovered and worked on. When a looped sec-

tion of line is to be isolated the same procedure is followed but by opening or closing the proper valves around each gate setting, the section to be isolated is by-passed and service through the second line continues uninterrupted.

Q. Before leaving your description of the company's main natural gas pipe line, Mr. Burnham, I wish you would state briefly what, if any, are the advantages of what you have termed loop lines?

A. Where the line is paralleled with a loop line, each of these sectionalizing gate valves is provided with cross-over connections thus, as I just stated, making it possible to operate the line continuously with one or more sections isolated. Aside from the added capacity provided by the loop line, this ability to isolate any section of the line, in [fol. 388] case of a break or other trouble, is of great advantage to the ultimate gas consumer. Repairs to lines and large scale maintenance programs may be carried out on a loop or double line without discommoding the public in the slightest degree, an advantage not possessed by most gas pipe lines in this country.

* * * * * * *

Between Liberal compressor station and the terminus of the line at the Illinois-Indiana boundary approximately 70 percent of the main line system is now looped, and it is expected that by the end of the year 1942 Panhandle Eastern Pipe Line Company will possess the only completely looped long distance natural gas pipe line system in the country.

Q. What would you say, Mr. Burnham, with respect to the effect of such looping upon the ability of the company to assure continuity of service to its customers?

A. I should say that such continuity of service is much more nearly assured by such a line than could be possible with a single line. In other words, I am of the opinion that the double or looped pipe line will assure the protection and continuance of service in a very positive manner.

Trial Examiner: May I ask: When you cut out one of the parallel lines, is the pressure stepped up in the other?

The Witness: Yes, if the season of the year permits you [fol. 389] to step up the pressure.

Of course, we have, as you know, a maximum operating pressure of 500 pounds. If we cannot step up the pressure, the service might be curtailed to some non-essential industry during that period.

Trial Examiner: But you ordinarily do step up the pressure so that the actual delivery is not curtailed?

The Witness: Yes, we ordinarily step up the pressure.

Trial Examiner: So that it is not materially affected?

The Witness: Yes.

* * * * * * * * *

[fol. 390] Q. Now, returning for the moment, Mr. Burnham, to Exhibit 15 for identification, that is the map of the main pipe line system of the company, does that map show the extent of looping which has been completed or is in progress on the company's main line?

A. It does. And when the work now in progress has been completed, 88.2 percent of the main line system will be looped, and there will be only four short sections east of Liberal, Kansas, which are not completely looped.

Q. That is east of Liberal, Kansas?

A. That is right.

Q. Now, I wonder if you will explain the type of construction shown by the dotted lines in the State of Michigan and northern Illinois on the map, Exhibit 15 for identification?

A. The pipe lines shown by purple dots in those States are being constructed for the purpose of furnishing gas to additional communities. They, as well as the loop lines [fol. 391] now in progress, will be completed as fast as pipe can be obtained and laid.

Q. Now, Mr. Burnham, will you please describe generally the flow and route of natural gas in the company's pipe line system?

A. As shown by Exhibit 15 for identification, gas produced in the Panhandle field moves first to the Sneed compressor station in Moore County, Texas; thence to Hansford compressor station in Hansford County, Texas; and thence to the compressor station at Liberal, in Seward County, Kansas. Liberal is also the point at which the gas gathered by the network of gathering lines in the Hugoton

Field is delivered to the main line. While the trunk line from Sneed to Liberal is of main line type and construction, and a small volume of gas is delivered from it for use in the small community of Gruver, in Hansford County, Texas, yet the entire group of lines west of Liberal including this line from Texas is in a sense a large gathering system. In fact, Panhandle Eastern is now receiving a part of its purchased gas at a point on its line near Baker, Oklahoma. (It is not intended to present on Exhibit 15 an accurate outline of the southern portion of the Hugoton field. The outline shown is only a general one.)

From Liberal the gas produced and purchased in Texas, Oklahoma and Kansas moves in an easterly direction [fol. 392] through compressor stations at Greensburg, Haven, Olpe, Louisburg, Houstonia, Centralia, Pleasant Hill, Glenarm, and Tuscola to Dana measuring station near the Illinois-Indiana line. At Dana measuring station the gas is delivered to the Michigan Gas Transmission Corporation.

At many points along the main line, lateral lines belonging to the Panhandle Eastern Pipe Line system deliver gas to communities hereinafter referred to as being supplied by Panhandle Eastern Pipe Line Company, or for delivery to those industries to which the Panhandle Eastern Pipe Line system renders direct service. The lateral lines in Kansas and Missouri belong to Panhandle Eastern Pipe Line Company and those lateral lines which are in Illinois belong to Illinois Natural Gas Company.

Q. What is the final destination of the natural gas which has not been withdrawn through laterals in Kansas, Missouri and Illinois, and which has not been lost or used [fol. 393] in transit through the company's main line system?

A. That gas is delivered to Michigan Gas Transmission Corporation at the Dana measuring station near the Illinois-Indiana line.

Some of that gas so delivered to the Michigan Gas Transmission Corporation is sold by that corporation to customers of its own, which furnish gas at retail in certain communities in Indiana. Certain of the rest of the

gas is transported by the Michigan Gas Transmission Corporation for Panhandle Eastern Pipe Line Company, for a consideration, to customers of Panhandle Eastern Pipe Line Company in Indiana, Ohio, and Michigan, including Michigan Consolidated Gas Company at Detroit. These customers in turn distribute the gas at retail in various cities and communities in those States.

* * * * * * * *

[fol. 394] Q. Mr. Burnham, have you prepared a schedule showing the various compressor stations of the Panhandle Eastern Pipe Line Company's system, together with the year of their construction and the horsepower now installed at each station? A. I have.

Q. Is the document which I now show you, which is headed "Schedule 1," the document to which you have referred? A. It is.

Q. Was that prepared by you or under your direction?

A. Under my direction.

Q. And do you believe it correctly states what it purports to state?

Mr. Wheat: Mr. Examiner, I should like to ask that the one-page document marked "Schedule 1", be introduced for identification as Exhibit 17.

(Schedule 1 referred to was marked as Exhibit No. 17 for identification.)

[fol. 395] By Mr. Wheat:

Q. Now, I note on this exhibit, 17 for identification, Mr. Burnham, that only three of these twelve main line compressor stations appear to have been constructed when the line was first placed in operation; is that not correct?

A. It is. The three compressor stations which were originally installed are those at Liberal, Kansas; Louisburg, Kansas; and Glenarm, Illinois.

* * * * * * * *

Q. Mr. Burnham, how was it possible to operate this main line system with only three compressor stations?

A. This was possible because of the comparatively small amount of natural gas then being moved through the system, and prior to 1936 the gas produced in Texas moved on well head pressure more than 100 miles to the station

at Liberal, Kansas. It was there compressed and moved more than 350 miles to the Louisburg station where it was again compressed and moved some 285 miles to the compressor station at Glenarm.

[fol. 396] Q. Was it later found necessary to install additional compressor stations?

A. I do not think it is correct to state that it was later found necessary to do this. The company recognized at all times that as soon as the pipe line was fully loaded and as soon as its reasonably-to-be-expected markets should develop, additional compressor stations would be required in order to move through the pipe line the greatly increased volumes of gas which would then be required by those markets. As proof of this, it is of interest to note that compressor station sites for all but two stations were acquired at the time the line was originally built, and dividing gates required for compressor stations as well as side gates were installed at that time.

Q. Were such additional stations actually installed?

A. Yes, as shown by the schedule, in 1936 a new compressor station was installed southwest of Liberal, Kansas, three stations were installed between Liberal and Louisburg, three between Louisburg and Glenarm, and in 1937 one east of Glenarm. In 1940 a second compressor station was installed southwest of Liberal.

Q. In addition to constructing these new compressor stations, has any increase been made in the compressor horsepower of the original stations?

A. Yes, the horsepower at Liberal, which was origi-
[fol. 397] nally 4,000 in 1930, was increased to 5,000 in 1931, to 7,000 in 1936 and to 10,000 in 1937. The original 5,000 horsepower at Louisburg was increased in 1937 to 7,000 and the original 4,000 horsepower of Glenarm station was increased in 1937 to 5,000 and in 1940 to 6,000. I think I should add that the horsepower at Glenarm station is now being further increased by the addition of another, 1,000 horsepower unit to bring it to a total of 7,000 horsepower.

Q. Have any of the other stations which were installed since 1930 been given added horsepower?

A. Yes, the Greensburg station, which was originally installed with 3900 horsepower in 1936 was increased to

7800 horsepower in 1937. The same thing was done at the Haven and Olpe stations; Centralia, with 3,900 in 1936, was increased to 6,500 in 1937; Pleasant Hill, with 2,600 in 1936 was increased to 6,500 in 1937. An additional 1,300 horsepower unit is being installed at Pleasant Hill this year which will increase its power to 7,800. Tuscola, constructed with 3,900 horsepower in 1937, was increased to 5,100 in 1939, and a new 600-horsepower unit is now being installed which will increase its rating to 5,700 horsepower.

Q. The total compressor horsepower on the system has, therefore, been materially increased, has it not, commencing in 1936?

A. Yes, commencing in that year, the horsepower of [fol. 398] the main line compressor facilities has been increased from fourteen thousand to eighty thousand one hundred, and with the completion of installations now in progress, this figure will be increased to a total of eighty three thousand horsepower.

. . . . . .

From Sneed station to Hansford the distance by pipe line is 51.50 miles;

From Hansford to Liberal, the distance is 53.99 miles —

. . . . . .

From Liberal to Greensburg, the distance by pipe line on the original line is 86.72 miles.

Q. And on the loop line?

A. 63.34 miles.

. . . . . .

From Greensburg to Haven, the original line is 85.94 miles, and 65.67 miles is the length of the loop line;

[fol. 399] From Haven to Olpe, the original line is 92.66 miles, and of this distance 66.62 miles is looped;

From Olpe to Louisburg, the original line distance is 85.89 miles, and of this distance 59.08 miles is looped;

From Louisburg to Houstonia, the distance on the original line is 73.45 miles, and of this distance 63.31 miles is looped;

On the original line between Houstonia and Centralia, the distance is 71.23 miles; and of this distance 55.59 miles is looped;

From Centralia to Pleasant Hill station the distance by pipe line is 71.15 miles, and of this distance 47.02 miles is looped;

From Pleasant Hill to Glenarm, the distance is 70.67 miles, and of this distance 43.01 miles is looped;

From Glenarm to Tuscola the distance by pipe line is 69.52 miles, and of this distance 33.52 miles is looped;

From Tuscola to the terminus of the line,—in other words, to the Illinois-Indiana line, the distance is 44.03 miles, and of this distance 23.79 miles is looped.

Q. What is the approximate percentage of looped line between the Liberal station and the terminus of the line—the Indiana-Illinois boundary?

A. I think I stated before 70 percent, approximately.

* * * * * * * *

[fol. 400] In addition to the main trunk line just described, with its attendant field gathering lines, the Panhandle Eastern Pipe Line Company system owns and operates 597.4 miles of lateral lines of various sizes and lengths; in Texas, 2.8; in Kansas, 65.5; in Missouri, 266.8, and in Illinois 262.3.

* * * * * * * *

[fol. 401] As already stated, the gas, on its journey from the fields to eastern markets, passes under numerous streams and rivers. The principal rivers where multiple line submerged crossings are used, are as follows: Beaver River in Oklahoma, Cimarron River, Arkansas, Neosho and Osage Rivers in Kansas, Lamine and Missouri Rivers in Missouri, the Mississippi River where both a submerged crossing and a crossing on the Champ Clark Bridge are utilized, and the Illinois and Sangamon Rivers in Illinois.

Aside from certain constructional advantages, multiple lines are used under rivers for the purpose of making service more certain; if a single line were built across a river

and it should be washed out, it would take days, even weeks in some cases, to resume service on the system. To avoid this possibility, it has been the practice of this company to divide the line at river crossings into two or smaller lines, thus insuring itself to a greater extent against a complete interruption of gas supply, since essential deliveries can be maintained if only one line of the multiple constituting the river crossing is left in service.

* * * * * * * *

[fol. 402] In addition to the company's main line property and the production and gathering systems and lateral pipe lines, the company owns and operates another unit or minor system termed its local area system, which lies to the south of Kansas City in both Missouri and Kansas.

The greater part of this local area system was built in 1928 and 1929 to gather gas produced from shallow wells in Miami, Franklin and Lynn Counties, Kansas, and Jackson County, Missouri, and distribute it to the towns and communities in the immediate vicinity. The size of the lines constituting this local area system varies from two to ten inches in diameter and the total length of these lines is:

Kansas—257 miles, Missouri—110 miles.

Practically all of the gas in this local area is purchased from independent producers and is sold for resale in the town and villages in the immediate vicinity; however, during cold weather the gas supply derived from these shallow wells is wholly inadequate for the requirements of these small towns and it has been found necessary to supplement the locally produced supplies with gas from the main line system. Some sales, principally in the summer months only, are made to the Cities Service Gas Company at Kansas City. There are approximately five hundred [fol. 403] and twenty-three wells, in 22 of which the company has an interest, attached to our lines in this area.

* * * * * * * *

The locally produced gas supply in this area is fast dwindling and it is anticipated that it will soon be neces-

sary to abandon the greater portion of his local area system.

Q. Mr. Burnham, have you prepared a schedule listing the principal communities served by Panhandle Eastern Pipe Line Company's system in the States of Texas, Kansas, Missouri, and Illinois?

A. I have, and I should add that the schedule in question also lists the principal communities in Indiana, Ohio, and Michigan served by the system through utilization of facilities owned and operated by Michigan Gas Transmission Corporation.

Q. Is the document marked Schedule 2, which I show you, the study which you mentioned? A. It is.

Q. Was this made by you, or under your direction?

[fol. 404] A. Under my direction.

Q. And do you believe it correctly shows what it purports to show? A. I do.

. . . . . .

(Identification Markings on Schedule 2 of "Exhibit 18" Deleted and the Same Was Remarked "Exhibit 17, Schedule 2" For Identification.)

. . . . . .

[fol. 405] Q. Now, in addition to the communities mentioned on Schedule 2, are there any other communities which the company has contracted to serve?

A. Yes, the company has contracted to serve and is attempting to make service available as soon as facilities can be constructed to the following communities:

In Illinois: Abington, Galesburg and Knoxville.

In Indiana: Greenfield and Richmond.

In Michigan: Adrain, Albion, Battle Creek, Flint, Jackson, Kalamazoo, Owosso, Marshall, Pontiac and more than eighty small communities in the same general area.

. . . . . .

The company has contracts covering direct industrial sales with sixteen industrial consumers.

[fol. 406] Q. Have you prepared a schedule showing the names of these industrial consumers and the purposes for which the gas is used by them, respectively, as well as the dates on which they were first rendered service?

A. I have.

Q. Is the document marked "Schedule 3", which I now show you, the schedule in question?

A. It is.

. . . . . .

(Schedule 3 Referred To Was Marked As Exhibit 17, Schedule 3, For Identification.)

Q. Now, Schedule 3 is self explanatory, is it not, Mr. Burnham? A. It is.

. . . . . .

The company owns 91 producing gas wells, 34 of which are in Kansas, and 57 in Texas. It also owns a 50 percent interest in 46 producing wells in Kansas.

[fol. 407] Q. Have you prepared a schedule giving a list of the wells you have just enumerated, separated as to State and ownership?

A. I have, and I have also shown the depths of the respective wells and the principal items of pipe and equipment used in each well.

Q. Is the schedule which I now show you, marked "schedule 4", the document which you have referred to?

A. It is.

. . . . . .

Q. Have you also prepared a schedule showing the equipment used in the various compressor stations?

A. Yes, and I wish to emphasize that the size, type and capacity of the equipment in the various compressor stations vary, depending on the requirements of the individual station and the availability of various types of equipment when it was installed.

. . . . . .

[fol. 408] Q. Now, have you also prepared, Mr. Burnham, a schedule showing the main principal items of equipment and the structures contained in the company's dehydration and gasoline plants?

A. Yes, the company has a dehydration plant at Sneed, Texas, and a dehydration and gasoline plant at Liberal, Kansas. I have listed the principal structures and major items of equipment at each of these plants.

Q. Is the schedule marked "Schedule 6", which I now show you, the schedule which you referred to?

A. It is.

. . . . . .

[fol. 409] Q. Now, Mr. Burnham, is it a fact that at some points the company has constructed residence and housing facilities for its employees?

A. Yes, some of the compressor stations were located at points where adequate housing facilities were not otherwise available. In addition, since there were no housing facilities in the production areas where the company secures its gas supplies, it has been necessary for the company to construct certain camps for the use of its employees.

. . . . . .

These camps are located at the Sneed, Liberal, Hansford, Louisburg, and Glenarm compressor stations, and also, for production forces, at Hugoton, Kansas, and at Fritch and Zoffness, Texas.

Q. Have you prepared a schedule showing the location of these various camps and also the principal structures and equipment there installed? A. I have.

Q. Is the document which I now show you, marked "Schedule 7" the document to which you have referred?

[fol. 410] A. It is.

. . . . . .

Q. Does the Panhandle Eastern Pipe Line Company possess many measuring or regulating stations and auxiliary equipment?

A. Yes, the company has more than 600 measuring and regulating stations to operate and maintain, and it is necessary in that connection for the company to have large quantities of equipment and tools especially suited to this particular, and highly technical work.

Q. Have you prepared a schedule showing in general the property and equipment owned by the company and

used by the Gas Measuring Department for maintenance and repair purposes? A. I have.

Q. And is the schedule marked "Schedule 8", which I now show you, the document in question? A. It is.

. . . . . .

[fol. 411] Q. Now, Mr. Burnham, what have you to say about the warehouses and general equipment of the company?

A. The Pipe Line Department must, at all times, have on hand at convenient points along its pipe line system, adequate quantities of material and supplies in order to maintain uninterrupted service to gas customers on the system. For this purpose it has twelve warehouses, together with automotive and other special equipment essential to both routine operations and emergency service. Two warehouses are also maintained for the Production Department.

Q. And have you prepared a schedule showing the various warehouses and their location and the major equipment located at each warehouse? A. I have.

Q. And is the schedule marked "Schedule 9", which I now show you, the one to which you refer? A. It is.

. . . . . .

[fol. 412] Q. Does Panhandle Eastern Pipe Line Company own any automotive equipment?

A. It owns 107 trucks and automobiles. In addition to the automotive equipment of the Pipe Line Department, consisting of thirty-three trucks and sixteen passenger cars, and the four trucks operated by the Production Department, there were fifty four other automobiles in service on the system as of June 30, 1941.

Q. Have you prepared a schedule showing the automotive equipment you have just mentioned?

A. I have, including the various departments in which these units are used.

Q. Is the document which I now show you, which is marked "Schedule 10", the one to which you refer?

A. It is.

. . . . . .

Q. Now, have you also prepared a schedule showing, on a single page, the various sizes of pipe included in the lines

of the Panhandle Eastern system and the miles of pipe by sizes?

[fol. 413] A. I have. This schedule is as of June 30, 1941, and includes all pipe laid and in use in the company's main line, gathering lines and laterals, but does not include pipe or material in stock. In this schedule the pipe is classified according to use and to size.

Q. Is the one page document marked "Schedule 11", which I now show you, the study you just mentioned?

A. It is.

[fol. 415] Q. Now, Mr. Burnham, you have afforded us with a general picture of the extent of the physical properties constituting this natural gas transmission system. I wish you would tell the Commission what is the capacity of the main line of this system?

A. The delivery or sales capacity is approximately 250,000,000 cubic feet per day.

Mr. Goodman: Will you please repeat that?

The Witness: The delivery or sales capacity is approxi-
[fol. 416] mately 250,000,000 cubic feet per day.

Q. At what pressure is the pipe line presently being operated?

A. At a maximum pressure of 500 pounds gauge per square inch.

Mr. Goodman: 500 pounds, what?

The Witness: Per square inch gauge pressure.

Q. How much gas did the system handle last year?

A. 58,535,000,000, in round numbers.

Q. Of this total, Mr. Burnham, how much gas was used for fuel and other purposes, including gas lost in transit?

A. 4,140,000,000 cubic feet, in round numbers.

Q. And is it a proper statement to say that the difference between the last two figures which you have mentioned represents gas sold?

A. Yes, it represents main line sales amounting to 54,395,000,000 cubic feet.

. . . . . .

[fol. 417] Trial Examiner: The documents which have been described and respectively identified as Exhibits 15, 16, 17 and its 11 schedules, and 18 are received in evidence, without objection.

. . . . . .

[fol. 419] Mr. Culton: Mr. Examiner, the next two witnesses whose testimony will be presented are both geological witnesses; that is, they will testify, one of them with respect to the geological conditions in the Panhandle field and the other with respect to the geological conditions in the Hugoton field. Both will give some statistical information.

On the assumption that it might be of more convenience to the Examiner and also to the other counsel, we have prepared the testimony of these two witnesses in written form, so that it can be distributed. There are schedules attached to it, and I had in mind, if it suits the convenience of the [fol. 420] Examiner and counsel, to offer that testimony as the sworn written testimony of these witnesses and just interrogate them generally with respect to certain matters with regard to some of the maps that are presented in connection with their testimony; and I, myself, at this time, that is, at the time of presenting each witness, can tell the Examiner and counsel the nature of the testimony of these witnesses. If that is suitable, it will expedite the hearing.

Trial Examiner: It is a very excellent plan, Mr. Culton, and it is one that always results in advancing the progress of the hearing.

Mr. Culton: That is what I had in mind; so, if that is satisfactory we shall handle these two witnesses in that way.

Trial Examiner: Very well.

. . . . . .

[fol. 421] RUFUS M. SMITH was called as a witness on behalf of the Panhandle Eastern Pipe Line Company, being first duly sworn, was examined and testified as follows:

Direct Examination.

By Mr. Culton:

Q. Your name is Rufus M. Smith? A. It is.

Q. You are an employee of Panhandle Eastern Pipe Line Company. A. I am.

Q. I hand you herewith document entitled "Written Testimony of Witness Rufus M. Smith" to which is attached Exhibit 30, consisting of a number of schedules. Does the written testimony referred to constitute your written testimony under oath in this case? A. It does.

Q. The schedules attached thereto, were they prepared under your direction? A. They were.

Q. Are the matters reflected in those schedules correct statements of the fact? A. Yes, sir.

* * * * * * * * *

[fol. 422] Trial Examiner: Very well. The reporter will mark the document, including 12 schedules which is the written testimony of Witness Rufus M. Smith, as Exhibit 30 for identification.

* * * * * * * * *

By Mr. Culton:

Q. I now present to you, Mr. Smith, a series of exhibits [fol. 423] marked 19 to 29, both inclusive, and one marked 30. I ask if these exhibits were prepared by you and under your direction.

A. Yes, they were, but one is missing. Exhibit 20 is hanging up. They all belong in the same series.

Trial Examiner: And the two maps which are hanging on the wall, may I ask, Mr. Smith, whether they belong to your series?

The Witness: They do.

* * * * * * * * *

Trial Examiner: These respective schedules and maps may be marked as indicated by Mr. Culton.

Mr. Culton: Nineteen to 29, inclusive, and 31.

Trial Examiner: Very well.

* * * * * * * *

[fol. 433] Mr. Culton: We do not and we offer the exhibits and his written testimony in evidence.

* * * * * * * *

Trial Examiner: The offer of Exhibit 30 in evidence will be withheld until completion of cross-examination when a ruling will be made on admission.

* * * * * * *

GLENN G. BARTLE was called as a witness on behalf of the Panhandle Eastern Pipe Line Company, and being first duly sworn, was examined and testified as follows:

(Exhibits Nos. 32 to 36, Inclusive, Were Marked For Identification.)

[fol. 434] Direct Examination.

By Mr. Culton:

Q. Your name is Glenn G. Bartle?

A. That is right.

Q. What is your present position?

A. I am Professor of Geology and Dean of Liberal Arts in the University of Kansas City.

Q. You have prepared a written statement of your experience and qualifications and the written testimony which you are prepared to offer in this case?

A. I have.

Q. You have also prepared certain schedules?

A. I have.

Q. Those schedules are attached to the written testimony? A. Exhibit 36.

Q. Exhibit 36 constitutes the written testimony and the schedules referred to? A. Yes, sir.

Q. You have also caused to be prepared under your direction certain maps and graphs numbered 32 to 35, inclusive? A. Yes, sir.

Q. Do those maps and graphs correctly reflect the facts they purport to reflect?

[fol. 435] A. They do.

Trial Examiner: These several maps and graphs which have been referred to have been marked for identification, respectively, as Exhibits 32 to 35, both inclusive, and 36 which constitutes the written testimony of the witness referred to.

Thirty-six has certain schedules attached which also are included in that identification.

* * * * * * * *

[fol. 443] R. J. Wallace, a witness appearing for and on behalf of the Panhandle Eastern Pipe Line Company, after first having been duly sworn, was examined and testified as follows:

* * * * * * * *

[fol. 444] Q. Your name is R. J. Wallace? A. It is.

Q. I hand you Exhibit 37 consisting of two volumes styled Parts 1 and 2. Has that been prepared by you?

A. It has.

Q. Have you, in connection therewith, in the introductory portion, presented in writing your testimony in this case? A. I have.

Q. Do the subdivisions attached thereto, as shown in volumes 1 and 2, present the facts which you offer in connection with your testimony and described in your written testimony? A. Yes, sir.

Q. The tabulations found under the summary contained in Part 1, do they represent accurate totals of the various items shown thereon? A. They do.

* * * * * * * *

[fol. 450] Trial Examiner: May I ask, Mr. Wallace, if you are able to state the number of pages in the two sections of the proposed Exhibit 37?

The Witness: 957 pages, I am sure.

Trial Examiner: In the two sections?

The Witness: In the two sections, yes.

* * * * * * * *

[fol. 451] Q. Mr. Wallace, how many leases did you treat in this study of the Panhandle Eastern?

A. I will have to check that. It was two hundred and eighty some, but I have my work sheets and I can check that very rapidly and give that to you also.

Trial Examiner: Exhibit 37, Parts 1 and 2, so far marked only for identification, has now been offered in evidence, and from the size of this exhibit it is readily evident that counsel will all desire time to examine it before any cross-examination can be had, and we will defer, therefore, cross-examination until such time as counsel indicate they desire it, subject to further arrangement of course.

* * * * * * * *

[fol. 452] Louis Fenn Sperry, a witness appearing for and on behalf of the Panhandle Eastern Pipe Line Company, having first been duly sworn, was examined and testified as follows:

Direct Examination.

By Mr. Wheat:

[fol. 453] Q. Where do you reside?

A. 12 Donnellan Road, Scarsdale, New York.

Q. Are you connected with Panhandle Eastern Pipe Line Company?

A. I am. Since February 1937, have been treasurer of that company, and of its subsidiary companies.

* * * * * * * *

I graduated from Williams College in 1919, with the degree of Bachelor of Arts. From 1919 to 1923 and again from 1929 to 1935, I was employed by the Guaranty Trust Company of New York, located at 140 Broadway, and later was one of the officers of its affiliated company, The Guaranty Company of New York, located at 31 Nassau Street. From 1924 to 1929 I was vice president of the National Bank of Auburn, at Auburn, New York. From 1935 to 1937 I was vice president of The National Bank of New Jersey at New Brunswick, New Jersey. And, as I have already stated, from 1937 to date I have been treasurer of Panhandle Eastern Pipe Line Company.

Q. In general, what has been the nature of your experience?

A. It has included both general and specialized duties covering practically all phases of commercial banking and [fol. 454] investment banking, together with the analysis of securities, the setting up of underwriting for corporations, and the marketing of corporate securities both through such underwritings and by retail sale. I have also, over the years, had considerable to do with the examination and study of corporate finances and corporate financial problems in general.

Since 1937 my experience has included general supervision of the financial operations of Panhandle Eastern Pipe Line Company, including the establishment and maintenance of both the private and public credit of that corporation.

Q. In connection with your work as treasurer of the Panhandle Eastern Pipe Line Company, have you become acquainted with the needs of that corporation for cash and materials and supplies for the current use of the company in its operations?

A. I have. I believe I am fully acquainted with the necessity of the corporation by way of proper and adequate provision for those items, and in this connection I have made definite recommendations to the management and to the Board of Directors in various meetings touching upon the financial policies of the corporation in this direction.

Q. Has your experience with the corporation given you [fol. 455] a knowledge of its affairs sufficient to enable you to determine the amount of cash and materials and supplies which it should have at hand at all times in order to properly conduct its affairs and to maintain a reasonable credit standard? A. It has.

Q. Have you recently made a detailed study of the operating conditions which confront the Panhandle Eastern Pipe Line Company for the purpose of determining in detail the amounts which that corporation will currently require for working capital? A. I have.

Q. What do you understand the term "working capital" to include?

A. I understand that term to include the materials and supplies necessary and requisite for the carrying on of current operations and current repairs, and also cash balances sufficient in amount to enable the corporation to pay promptly its current operating expenses as they accrue, to provide for such prepayments as are necessary, to afford provision for reasonably to be expected contingencies, and to make possible the continuous efficient operation of the corporation. This necessarily includes the meeting of such emergencies as they occur and the proper maintenance of current credit.

Q. In making the study you have just mentioned, would you consider this corporation being static in its operation? [fol. 456] A. No, because that is not the fact: This corporation is still growing and it expects further to enlarge its market outlets.

Q. Are the items included in your study, or are any of them, included or reflected in the plant accounts of the corporation?

A. No, none of the items included in my study are reflected in the plant account.

Q. Now, I wish you would tell us of what do these various items which make up your study consist.

A. They consist of (1) normal cash funds for operating expenses, (2) a provision for emergency cash, (3) a provision for necessary minimum bank balances, (4) a provision for necessary current advance prepayments, (5) materials and supplies, and (6) line pack.

Q. Now, Mr. Sperry, I wish you would take up and discuss each of these various items. Suppose you start with what you have termed "normal cash funds for ordinary operating expenses." I would like to have you state in your own words what you have done in order to determine the reasonable and proper amounts of such funds which you believe should be carried currently on hand.

A. As treasurer of this corporation it is my definite opinion, based upon my actual experience in handling the funds of the corporation, that it would be unwise, uneco- [fol. 457] nomical and improper for the company, management to attempt to operate this enterprise without at all times having available in cash the necessary money to pay its ordinary and usual operating expenses for a period of at least 45 days. I believe it would be preferable for the

company to have on hand at all times an amount sufficient to cover such expenses for a period of 60 days, and in my opinion the period of 45 days which I have just mentioned should be considered the only safe minimum for reasonable and economical operation. I have made a careful study of the operations of the company during the 18 months period ending June 30, 1941, for the purpose of determining its cash disbursements for purely operating expenses. Included in this study were payments for wages, gas purchased, overheads, ordinary maintenance, general operating expenses, normal regular construction expense of the nature of maintenance, on which no interest during construction is charged; also production, franchise, sales, workmen's compensation and unemployment taxes. Excluded from this consideration were amounts paid for materials and supplies, prepayments, and ad valorem, income and capital stock taxes, as well as payments for interest, [fol. 458] sinking fund, and other capital expense items. The total paid for such purely operating expenses during said eighteen month period was $5,609,600, or approximately $311,666 monthly. Such an expense for a 45-day period would be approximately $467,000. Having in mind the rising cost of wages and many other items included in this study, it is my judgment that the company should at all times have on hand for this purpose at least the sum of $470,000.

Q. Mr. Sperry, in addition to the provision of cash for ordinary operating expenses, is it necessary in your opinion for this corporation to maintain currently certain cash balances to cover reasonably to be expected emergency situations?

A. Yes, I believe that this company must make such provision. It must recognize that it is likely to be faced with operating or construction emergencies such as line breaks and serious accidents which may not be fully covered by insurance. It is also necessary to consider the circumstance that there is seasonal fluctuation of cash needs among typical 45-day periods and that the flow of cash must be adjusted by the maintenance of additional cash on hand to cover the unusual periods.

Q. For the purpose of coping with such emergencies as you have mentioned and also in order to adjust the flow of cash, is it your opinion that the company should main-

tain a cash balance over and above that which you have mentioned for the normal 45-day period?

[fol. 459] A. That is my opinion.

Q. How much do you believe the company must keep on hand to cover these items?

A. I believe that it should have available for these items a minimum sum of $100,000.

Q. Is it necessary for your corporation to maintain certain bank balances based at least partially on the activity of its account?

A. It is. Any company which issues a large number of checks must at all times maintain substantial bank balances, and the amounts required by the banks in this connection are based on the activity of the account in question. In my judgment, the appropriate sum which should be maintained for this purpose is not less than $200,000.

Q. In the course of its business, is it necessary for this corporation from time to time to pay certain items of operating expenses in advance of their normal accrual date? A. It is.

* * * * * * * *

I have reference to such so-called prepaid items as insurance premiums and advance rentals on undrilled acreage.

* * * * * * * *

These items necessarily paid for in advance are carried on the company's books as prepayments. They are extinguished by monthly charge-offs during the periods to which [fol. 460] they are applicable.

Q. Have you made a study to determine the amount of such prepayments?

A. I have. During the 6 months ending June 30, 1941, the prepayments averaged $128,087 each month-end. On June 30, 1941, they totaled $135,113, of which $55,361 represented lease rentals, $79,001 represented prepaid insurance, and $750 represented the prepaid rental upon a bridge river crossing.

Q. What is your judgment, Mr. Sperry, in respect to the fair and reasonable amount which you believe the company should keep on hand to represent and cover such prepayments?

A. In my judgment a minimum reasonable sum representing such prepayments would be $130,000.

Q. Now, Mr. Sperry, have you made any investigation in respect to the materials and supplies which this company must currently keep on hand?

A. I have made a careful investigation of that subject. This investigation has covered the materials and supplies not included in the plant account. Not only in respect to those now on hand, but also in respect to the amounts which will be required during the reasonable immediate future.

Q. I wish you would please state the amounts of such materials and supplies which are now carried on hand by the different departments of the company. Please state these amounts in dollars according to the cost of the ma-
[fol. 461] terials and supplies carried by each department.

A. The Transmission Department, including the Gas Measurement Division, has on hand currently $158,293.44 of materials and supplies. The Production Department has on hand $37,741.74. The Compressor Department, including Gasoline Plant and Auxiliary Equipment, has on hand $58,487.98. The Communications Department and the Cathodic Protection Department has on hand $2,862.98; and the Transportation Department, including Automotive Equipment, has on hand $3,700.47.

. . . . . .

The total is $261,086.61.

Q. Would you mind stating as of what date, Mr. Sperry?

A. That is approximately the middle of the year date.

Q. June 30th?

A. In some cases, the departments have submitted their inventories as of slightly different dates, but it is approximately the end of June or early in July.

Q. Now, Mr. Sperry, I understand you to state that the figures that you have just given is the aggregate amount of the cost of the materials and supplies now carried on hand. Is this amount reasonably representative of the materials and supplies which have currently been kept on hand by this company in its various departments over the
[fol. 462] past few years. A. It is.

Q. What is your opinion, based upon your experience with the company, in regard to the amounts of materials and supplies which should be kept on hand as of the present time and the immediate future?

A. I think the stock must be largely increased.

Q. Why?

A. Because the present situation in which we find ourselves is quite different from the conditions that have existed in the last few years.

Q. Do you base this opinion entirely upon judgment, or has the company acted to increase its current stock of materials and supplies along the lines you have indicated?

A. The company has acted directly along this line. In fact, a considerable amount of additional equipment is now on order, and many other items must be ordered in the immediate future and obtained before the coming winter season opens.

Q. Would it be your view, based upon your experience with the Company and your testimony just given, that the stocks of materials and supplies now carried or carried over the past few years, reflect an adequate standard for the immediate future?

A. I do not believe that they reflect such a standard.

Q. I wish you would state your reasons for this opinion.

[fol. 463] A. There are several such reasons which I should like to outline in some detail.

* * * * * * * *

Among the more important reasons which have lead me to form the opinion which I have just expressed are the following:

(1) Until recently, the company has been able to operate with excess facilities available so that when repairs were needed the remaining facilities were adequate, temporarily at least, to handle the required load while repairs were being made.

(2) It now conclusively appears that all available facilities are to be required to handle the peak loads which will be required by customers during the coming fall and winter months of the current year.

(3) The company is now operating its system at higher pressure than those employed in former years. It is obvious that due to this circumstance more frequent repairs will have to be made than have been required in the past because of the greater strain on the equipment.

(4) Since the line will be operating at capacity during peak periods, repairs will have to be made immediately, since it would be disastrous to wait for the necessary replacements to be obtained from the factories under current [fol. 464] manufacturing conditions.

(5) The parts included in this system which are ordinarily of short life are more nearly approaching the end of their usefulness. We anticipate, therefore, an increasing need for additional repairs.

(6) There is a great diversity of equipment used in our property and many types and sizes are necessary to be kept in stock. As examples the company is using approximately 10 different types of compressors, 15 different types of generators; 17 different types of meters, 72 different types of valves, 56 different types or sizes of pipe, and 18 different types of couplings. All of this diversified equipment is serviced out of fourteen warehouses, spread over approximately 800 miles of line. For efficient operation, it is necessary, in order that service interruptions be kept at a minimum, that full supply of extra parts be well distributed along the line so that when needed they may be obtained at the earliest possible moment. In connection with this, it is well to point out that the greater portion of our properties is located in areas far removed from the factories where most of the parts are manufactured.

(7). Until recently, it was not difficult to obtain parts and supplies shortly after the placing of an order therefor. Now, the situation in that respect has greatly changed. Practically all companies from which necessary supplies [fol. 465] must be obtained are required to give preference to orders placed as a result of the existing national emergency, and the ability of the manufacturer to furnish needed parts promptly is contingent on whether or not orders having a higher classed priority are being filled. This condition, in my opinion, will continue for an indefi-

nite time in the future. As a result of this situation, the company cannot hope to obtain as prompt deliveries as it has enjoyed in the past, and, therefore, is forced to carry much larger stocks of all types of materials and supplies, so as to be prepared for such emergencies as they arise.

(8) Finally, there is a serious and growing danger of damage to the physical properties resulting from acts of sabotage, of cranks, of the common enemy, the fifth columnist, the spy, and the like. This company's properties are particularly vulnerable to this type of damage. While not mathematically measurable, it is my opinion and the opinion of the management of the company, that this is a real danger, particularly in view of the fact that the line serves one of the great industrial defense areas. Accordingly, we believe that the company must be prepared immediately to repair any damage that may result from such acts.

Q. Can this company afford, Mr. Sperry, to allow any condition to arise which will interrupt its service?

A. No, the service rendered by this company must be [fol. 466] continuous and it cannot afford to have its service interrupted either by act of God or by the hand of man. It is clearly in public interest that no such interruption be allowed to occur.

. . . . . .

I believe it is clear, both for the company's own protection and in the public interest, that it be in a position to make such repairs promptly as required, whether the necessity therefor arises from natural wear and tear, action of the elements, activities of public enemies, or other causes.

Q. In this connection have you made an effort to determine the amounts of additional materials and supplies which should be carried on hand by this company?

A. I have.

. . . . . .

I have requested from each major operating department head of the company's organization a schedule of materials and supplies now on hand, stated at its cost, and

also the schedule of additional materials and supplies which, in the light of present circumstances, are now on order or should be immediately acquired. After receipt of [fol. 467] these reports from each department head, they were carefully checked by me and also by the responsible managing officers of the company.

* * * * * * * * *

In this connection I should explain that I have divided the amount of materials and supplies not now on hand into three classes: (1) those which are actually on order; (2) those which it is felt certain must and will be ordered within the next 90 days, and (3) those which the management deems necessary but which will not be required until sometime shortly after this 90-day period. The totals of these additional necessary materials and supplies are as follows:

Transmission Department, including Gas Measurement, $138,976.80; Production Department, $29,037.76; Compressor Department, including Gasoline Plant and Auxiliary Equipment, $188,700.35; Communications Department and Cathodic Protection Department, $15,662.06, and Transmission Department, Automotive Equipment, $2,015.68.

* * * * * * * * *

Total, $374,392.65.

Q. Now, Mr. Sperry, in order that the record may be entirely clear in connection with these various items, I wish you would state by departments, first the amounts of materials and supplies which are now on hand and on order; second, the amounts now on hand, now on order and which will be ordered within the next 90 days; and [fol. 468] third, the amounts now on hand, now on order, those which will be ordered within the next 90 days and those which will be placed on order shortly thereafter. I think you might read, by departments, the first item first.

A. The first figures I shall read are the materials and supplies now on hand or on order, combined.

For the Transmission and Gas Measurement, $189,730.97;

For the Production Department, $49,464.59;

Compressor Department and Gasoline Plant, $120,331.63;

Communications and Cathodic Protection Departments, $2,862.98;

Transportation Department, $3,700.47. The second item, by departments, represents the materials and supplies on hand, on order, and to be on order within 90 days:

Transmission and Gas Measurement, $249,074.91;

Production Department, $65,288.50;

Compressor Department and Gasoline Plant, $1[illegible] 13.53;

Communications and Cathodic Protection Departments, $9,877.80;

Transportation Department, $3,700.47.

Q. Now, finally, I wish you would state, by departments, the amounts now on hand and now on order, those [fol. 469] to be ordered within the next 90 days, and those which will be placed on order shortly thereafter.

A. Transmission and Gas Measurement, $297,270.24;

Production Department, $66,779.50;

Compressor Department and Gasoline Plant, $247,188.33;

Communications and Cathodic Protection Departments, $18,525.04;

Transportation Department, $5,716.15.

* * * * * * * *

The total amount of materials and supplies now on hand and now on order stated at cost is $366,090.64. The total of materials and supplies now on hand, now on order, and which will be ordered within the next 90 days, is $497,154.31. The total of such supplies including those for which orders will be placed within the near future but not within the 90-day period is over-all $635,429.26.

* * * * * * * *

In my opinion the general conditions facing the country at this time and also facing this particular enterprise, render it imperative that this corporation order and obtain additional materials and supplies as and when it appears

that they should be stocked, to the final total amount which I have mentioned. In other words, it is my opinion that [fol. 470] the company should have either on hand or represented by cash available to make purchases as required within the near future, materials and supplies totaling, at cost, not less than $635,000.

Q. Is it a fact Mr. Sperry, that before this company can sell any gas it must have its line filled with gas?

A. That is of course true: In other words, the company, before selling any gas, must first pack its line, and this line pack is always tied up as an investment not included in the ordinary plant accounts.

* * * * * * * * *

It amounts to approximately 851,578,000 cubic feet on a 16.4 pound pressure base and is calculated at an approximate value of 4 cents at the wellhead, this gas has an inventory value of $34,063.44, not considering the costs incurred by the company to pump the gas through this long line to the point where it is located, or the additional value which the gas must therefore possess in place along the pipe line. For working capital purposes, I have rounded off the figure to $34,000.

* * * * * * * * *

It is my judgment that the items which I have mentioned [fol. 471] constitute the minimum reasonable amounts of working capital currently needed in the conduct of the business of this corporation and on which it would receive no return unless they are included in the rate base.

* * * * * * * * *

These amounts consist of the following items:

Normal cash funds for operating expenses, $470,000; cash for emergencies, $100,000; minimum bank balances, $200,000; prepayments, $130,000; materials and supplies, $635,000, and line pack $34,000.

* * * * * * * * *

The total of these items is $1,569,000 and it is my judgment that this company by way of what is ordinarily referred to as working capital should at all times have on

hand, either in materials and supplies, or in cash, not less than that amount.

Q. In expressing your opinion, Mr. Sperry, in respect to the amounts of working capital which you believe to be currently required in the conduct of this company's business, have you included any item referable to the company's new construction program?

A. I have not. Any additional working capital which may or will be required as a result of that program will be an increase over the amount to which I have testified.

[fol. 472] Q. Let me ask you, Mr. Sperry, whether it has been the actual practice of this company in the past to carry in cash amounts aggregating at least as much as the total to which you have testified?

A. It has. While the company has not at all times kept on hand the materials and supplies in the aggregate amount which we now deem necessary because of present and prospective conditions surrounding the operation of this property, the company has during recent years kept on hand substantial cash balances sufficient at all times to enable it to purchase such additional materials and supplies as might have been needed and which could then be promptly secured under the conditions heretofore existing. This is in addition to cash balances adequate for all the other purposes which I have enumerated. Over the last four year period, the aggregate actual working capital, represented by cash, prepayments, and materials and supplies which the company has actually maintained as a part of its current business operations, has been as of the dates listed as follows:

June 30, 1937, $3,070,960.52; December 31, 1937, $1,889,574.34; June 30, 1938, $1,672,443.61; December 31, 1938, $1,646,111.52; June 30, 1939, $2,233,423.49; December 31, 1939, $5,731,934.85; June 30, 1940, $6,190,999.35; December 31, 1940, $4,030,616.16; June 30, 1941, $7,446,667.39.

* * * * * * * * *

[fol. 475] Oscar William Morton, was called as a witness on behalf of the Panhandle Eastern Pipe Line Company, and being first duly sworn, was examined and testified as follows:

Direct Examination.

By Mr. Wheat:

. . . . . .

Q. Where do you reside?

A. 21 West 69th Terrace, Kansas City, Missouri.

Q. Are you at the present time connected with Panhandle Eastern Pipe Line Company? A. I am.

Q. In what capacity? A. Rate engineer.

Q. How long have you served in that capacity?

A. Ten years.

Q. Now, Mr. Morton, I would like to have you state briefly the general nature of your education and experience.

A. Shortly after graduating from high school I attended a radio school and became a radio operator. Later, during the first World War, I was a radio instructor in [fol. 476] the Student Army Training Corps at Tulane University, New Orleans, Louisiana. Following the armistice I remained at Tulane University as a special engineering student until June 1921.

In February 1922 I was employed by the El Paso Electric Company under the Stone & Webster organization and commenced my work with that company as a draftsman in the engineering department. I later became maintenance engineer for the company and remained in that capacity until 1925 when I was transferred by Stone & Webster to Baton Rouge, Louisiana, where I was employed by the Baton Rouge Gas & Electric Company. I remained with the Baton Rouge company until March 1926 when I was transferred to City Gas Company, Norfolk, Virginia as assistant to the vice president of that company. I remained in that position until 1929 when I was transferred to the Virginia Electric & Power Company as head of its rate and insurance department.

After two years with Virginia Electric & Power Company I was employed by Panhandle Eastern Pipe Line Company and entered that employment August the first, 1931 as rate engineer, the position which I have occupied continuously since that time.

. . . . . .

[fol. 477] During these past ten years I have been what might most nearly be described as a special problems man.

I have prepared numerous economic studies of all types and descriptions involving the operations of the company and it has been my duty annually, since I came with the company, to prepare the company's annual revenue estimates, also to estimate in advance the maximum day for each winter as the basis for pipeline construction programs.

During 1935, '36, '37 and '38 I made pipeline capacity studies for the company and collaborated with the members of its engineering staff in the preparation of annual pipeline construction programs. It has also been my duty each year during the past ten years to prepare the company's budget—

Q. (Interposing) Mr. Morton, just in that connection, do you mean by that that it is an annual budget?

A. I do not refer merely to an annual budget but what might be called a constant budget.

Q. A continuing budget?

A. That is it, a continuing budget. That is, I do not only prepare the annual budget, but I give the budget problem continuous attention and am constantly revising it during each year.

. . . . . .

[fol. 478] As rate man for the company I prepare and supervise the preparation of all studies affecting the company's rates.

Q. Have you prepared a study showing costs incurred by this company in providing necessary capacity in its main pipeline prior to the time that that line became loaded?

A. I have prepared such a study.

Q. Did you reduce it to writing?

A. I have, in that I have summarized the results of the study in an tabulation which I have entitled "Basic Statistics Used in Calculating Interest, Ad Valorem Taxes and Operating Expense Attributable to Unused Capacity" and also "Five Different Methods of Calculating Interest, Ad Valorem Taxes and Operating Expense Attributable to Unused Capacity."

Q. Mr. Morton, is the two-page document which I now show you the study to which you have just referred?

A. It is.

. . . . . .

[fol. 479] (Document Referred to was Marked Exhibit No. 38 For Identification.)

By Mr. Wheat:

Q. Was Exhibit 38 for identification prepared by you, Mr. Morton? A. It was.

Q. Does it, in your opinion, correctly state the facts which it purports to state. A. It does.

* * * * * * * *

The data contained on this exhibit shows my calculation of the costs actually incurred by Panhandle Eastern Pipe Line Company in providing unused but necessary capacity in its main line system prior to the time that the pipe line became loaded. Page 2 of the exhibit summarizes the data under five different methods of calculation.

Q. I note, Mr. Morton, that you stated that you have included operating expenses attributable to unused capacity. Will you please state what operating expenses you have so included?

A. Certain operating expenses such as the cost of gas purchased and also royalty expense vary directly with the amount of gas sold. Other expenses such as administrative and general expense do not vary materially with the [fol. 480] amount of gas sold. A portion of the latter is attributable to unused capacity and it is to these expenses only that I refer where I have used the caption "Operating Expenses" in this exhibit.

Q. I wish you would explain, briefly, Mr. Morton, what you did in connection with the preparation of the exhibit which has been marked Exhibit No. 38 for identification.

A. In general I developed and followed a procedure which allowed me to calculate the interest, ad valorem taxes and operating expenses attributable to unused capacity on five different methods. What I attempted to do was to compare various conditions obtaining during the first year when the pipeline could be and was operated under conditions closely approaching that for which it was designed with conditions during previous years when a considerable portion of interest, taxes and operating expense actually incurred was paid out on account of unused capacity in the line.

Q. What period did you select as being the first year when the pipeline was loaded?

A. The period from October 1, 1936 to September 30, 1937. This was a period during which I believe the conditions under which the line was operated could fairly be said very nearly to approach those for which the line was designed. Prior to that time there was a varying amount [fol. 481] of unused capacity.

* * * * * * * * *

Q. Mr. Morton, I wish you would explain briefly the source of the nature of the data which you have included on the first page of Exhibit 38 for identification?

A. The source of the information contained on the first sheet of the exhibit is the books and records of the com- [fol. 482] pany. The data contained on sheet 1 is merely a compilation of statistics, investment, gross revenues, thousands of cubic feet sold, maximum daily sales, line capacities, interest charges, ad valorem taxes and certain operating expenses by periods from April 1, 1932 to September 30, 1937. The periods selected are shown at the head of columns identified by letters.

The first period, Column A, is a nine-months period, April 1, 1932 to December 31, 1932. The next three periods, Columns B, C, D, are calendar periods. The fifth period, Column E, is another nine-months period and the sixth period, Column F, is a 12-months period.

Q. Why did you use two nine-months periods as shown at the heads of Columns A and E?

A. Many of our figures are more readily available on our books on calendar year bases. For this reason I tried to stick to calendar years where I could and I did so in the case of the second, third and fourth periods.

This necessitated the use of two nine-months periods. I might add that throughout the exhibit I have made proper adjustments for nine-months periods in all cases where comparisons are made with annual periods.

Q. Now, will you turn to page 2 of Exhibit 38 for identification and explain the nature of the calculations which you have headed "Direct Investment—Volume Method"? [fol. 483] A. In this first method I calculated the investment per thousand cubic feet of gas sold during the period October 1, 1936 to September 30, 1937, which period I have previously referred to as the loaded period.

I next determined the investment per thousand cubic feet sold during the previous periods using data shown on Sheet 1. Then, by comparing the investment per thousand cubic feet sold during the loaded period, Column F, with the respective investments per thousand cubic feet sold during each of the previous periods, Columns A, B, C, D and E, I arrived at the percentage of unused investment during each such period.

These percentages I then applied to interest, ad valorem taxes and my selected operating expenses incurred during these particular periods on account of unused but necessary capacity the resulting figure represents, in my opinion, one reasonable measure of the costs to this company attributable to unused but necessary capacity during the periods preceding the loaded period.

Q. Now, Mr. Morton, will you explain what you did in connection with the second method shown on page 2, Exhibit 38, that you headed "Direct Investment—Revenue Method"?

A. In this particular study I first determined the investment per dollar of revenue received during the early years as compared with the investment per dollar of rev- [fol. 484] enue received during the loaded year and from these data I obtained a percentage of unused capacity for each of the preceding years.

These percentages I then applied to certain costs incurred during those previous years in the same manner as the percentages were applied under the first method. The resulting figures represent, in my opinion, another reasonable measure of the costs attributable to unused but necessary pipeline capacity provided during the periods prior to that which I have termed the loaded period.

Q. Now, will you direct your attention to the method shown on page 2, Exhibit 38, which you have headed "Direct Investment-Maximum Day Method" and explain what you did under that method?

A. In developing the figures under this third method I followed the same plan as was followed under the first and second methods which I have described, except that in connection with this third method I compared the investment per thousand cubic feet sold on the maximum day

during the early periods with the investment per thousand cubic feet sold on the maximum day of the loaded period.

In my opinion, the result shown under this third method is also a reasonable measure of the costs attributable to unused but necessary capacity provided in this pipeline prior to the date it became loaded.

[fol. 485] Q. Now, Mr. Morton, will you turn to your fourth method which you have headed "Adjusted Base Year—Volume Method" and explain what you have done in connection with that method?

A. Under this method I compare the actual volume of gas sold during the early periods with the volume sold during the loaded year.

Q. Did you make a direct comparison between the volume of gas sold in the loaded year with that sold during previous years?

A. No. I adjusted the quantity sold during the loaded year to a basis comparable with former years before making any comparisons.

Q. I wish you would explain why you did that.

A. Just prior to the loaded years we added enough compressor stations to our system to enable us to carry a full load in our line. It would not be fair to compare directly the volume of gas sold during previous years when the capacity of the line was 80,000,000 per day.

Q. Eighty million what?

A. Cubic feet, 80,000,000 cubic feet per day with the volume of gas sold during the loaded year when the capacity had been increased to 125,000,000 cubic feet per day.

Q. Well, Mr. Morton, how did you go about adjusting [fol. 486] the volume during the loaded year to a proper basis for comparison?

A. I reduced the volume sold by 45/125 which is the difference between the capacity during the two periods or, to put it another way, I multiplied the volume during the loaded year by 80/125 in order to arrive at an adjusted volume for comparison with other years.

Q. What did you do next?

A. I then compared the volumes during the previous years with the adjusted volume during the loaded year.

From that point the procedure was the same as described in Methods 1, 2 and 3.

Q. Now, is it your opinion that this method also represents a reasonable method of determining the costs of this company attributable to unused but necessary capacity provided during the period prior to that which you have termed the "loaded period"?

A. Yes.

Q. I note that you have also included a fifth method which you have termed "Adjusted Base Year, Revenue Method." I wish you would explain what you did in connection with that method.

A. Under this method I followed essentially the same procedure as that which I outlined in connection with Method No. 4, my adjusted base year volume method. In other words, I have compared each preceding period to the loaded period on the basis of revenues instead of volumes, [fol. 487] but I have adjusted the revenues during the loaded year upon the ratio of the capacities during the loaded and unloaded periods just as I did in the fourth method. It is my opinion that this fifth method also constitutes a reasonable approach to the problem of determining the cost attributable to unused but necessary capacity in the pipeline prior to the loaded year.

Q. Have you included in this study of yours any of the facilities of the company located near Kansas City and sometimes referred to as the "local area system?"

A. No, I have not included any such facilities. They were not connected with the main line system of the company during the years covered by my study of costs attributable to unused capacity and since my study concerns main line capacity only and the cost of maintaining excess capacity in that main line during certain periods, I have eliminated the investment, sales and charges connected with what we term "local area operations."

Q. Does the Panhandle Eastern Pipe Line Company also own certain natural gas production facilities in western Kansas which are not connected with its main pipe line system?

A. Yes, the company owns certain production facilities in Western Kansas which are used to supply gas to the Argus pipeline system but which are not connected with

[fol. 488] its main line system from the Texas Panhandle field to eastern markets. I have, therefore, in this study eliminated all investment, sales and charges connected with that operation.

Q. Is it a fact, Mr. Morton, that during certain of the earlier years of the company's pipeline operations gas in varying amount was transported for the Northern Natural Gas Company?

A. Yes, that is correct. During the early years we transported some gas for Northern Natural Gas Company through a short section of the main line in western Kansas. This was a temporary arrangement and it was discontinued as soon as our full load came on in 1936.

I have, therefore, eliminated from this study all revenues received from this source and also all figures covering gas transported for Northern Natural as well as the investment in that portion of the Panhandle Eastern Pipe Line Company's facilities used in such service.

Q. What is the effect, in general, of these eliminations?

A. The effect of these eliminations is that none of the above facilities appear as unused capacity in this study.

* * * * * * * * * *

[fol. 491] P. McDonald Biddison was called as a witness on behalf of the Panhandle Eastern Pipe Line Company, and being first duly sworn, was examined and testified as follows:—

Direct Examination.

By Mr. Wheat:

* * * * * * * * * *

[fol. 492] Q. Where do you reside?

A. Dallas, Texas.

Q. Have you been employed by the Panhandle Eastern Pipe Line Company as consulting engineer?

A. I have, several times.

Q. On more than one occasion? A. Yes, sir.

Q. And have you been employed to make certain studies in connection with the pending case? A. I have.

Q. I wish, Mr. Biddison, that you would state rather fully your background, education and experience with particular reference to the natural gas business and your knowledge

of the properties and operation of the Panhandle Eastern Pipe Line Company.

A. I am a graduate of Kansas State College with a degree of Bachelor of Science in Electrical Engineering, Class of 1904.

After graduation I spent about one year on miscellaneous work as draftsman, electrician and stationary engineer in cement plants at Iola, Kansas.

Following this I began work in the natural gas industry at Columbus, Ohio, May 20, 1905 on work for the Kansas Natural Gas Company, which company at that time was constructing a transmission system to serve markets in [fol. 493] Kansas and at Kansas City, Missouri. I worked under the direction of the then chief engineer for the Logan Natural Gas & Fuel Company who was at the same time consulting engineer for Kansas Natural Gas Company.

In 1906 I became chief engineer for the Logan Natural Gas & Fuel Company at Columbus, Ohio and in 1907 I went to Joplin, Missouri as sales engineer with the Hope Engineering & Supply Company who were engaged in the design and construction of gas producing, transmitting and marketing equipment.

In the fall of 1907 I became assistant to the chief engineer of the Kansas Natural Gas Company and was stationed at Independence, Kansas. My duties were the supervision of construction of gas transmission and compression and measuring and regulating installations.

In the fall of 1908 I became construction engineer for the Columbia Gas & Electric Company upon the installation of their system from West Virginia to Cincinnati, Ohio. I had charge of construction of the western end of their pipeline system from a point near Alexandria, Kentucky through the suburbs of Cincinnati and across the river into Cincinnati.

In the following year, 1909, I designed and constructed their compressor station at Kenova, West Virginia.

During 1910 I was construction engineer for the Ohio [fol. 494] Fuel Supply Company in Ohio and overhauled some of their compressing equipment and installed additional such equipment at Homer, Ohio.

During 1913 I was mechanical engineer with the Texas Company at their Port Arthur, Texas refinery. I was engaged in the design and installation of a water supply system for the refinery, additional boiler plant capacity and electrical generating installations. I also installed an exhaust system throughout the refinery and assisted in the design of foundations and reinforced concrete structures for a wax plant and an oil filtering installation.

In 1912 I returned to Ohio as construction engineer for the Ohio Fuel Supply Company and its affiliated companies. I remained with that organization until the spring of 1919.

During this period I acted as consultant to various departments of this organization on technical matters and I designed and installed the gas compressing stations; reinforced concrete shop buildings, regulating and metering equipment and beginning in 1916 I carried on experimental work in connection with representatives of the United States Bureau of Mines upon the extraction of natural gasoline from the natural gas.

I later designed and built gasoline plants for the Ohio Fuel Supply Company and for the Onio Fuel Oil Company [fol. 495] in West Virginia and for the Lone Star Gas Company in Texas.

During the period from 1917, about, until the spring of 1919 I supervised the operation of the gasoline production department of the Ohio Fuel Oil Company in West Virginia.

During the period 1914 to 1919 I also acted in the capacity of consulting engineer to the Lone Star Gas Company whose offices were then located at Fort Worth, Texas and which company at that time had a transmission system from Petrolia fields near Wichita Falls, to Fort Worth and Dallas and other Texas points as well as connections for gas supply from Oklahoma fields.

During this period I predicted for this company the amount of extensions necessary to be made to their transmission facilities in order to meet their increasing markets, the amount of additions to be required through their com-

pressing facilities and the amount of additional drilling required to be done in the respective producing areas in order to maintain a supply of gas for those markets.

In addition, during the period of the World War I acted as consulting engineer on war gases to the United States Bureau of Mines and in that capacity supervised the construction of helium-producing plants at Fort Worth, Texas and at Petrolia, Texas. I also conducted a search during that period in every known gas-producing section of [fol. 496] United States for helium-bearing natural gas.

In the spring of 1919 I went to Mexico as construction engineer for the A. G. W. I. Companies. These companies were subsidiaries of the Atlantic Gulf and West Indies Steamship Company. I spent one year in this connection upon the design and construction of oil pipelines, oil pumping stations and off-shore bulk oil loading stations.

At the conclusion of my year with this organization I spent nearly one additional year in Mexico upon similar work for the Tide Mexico Company, a subsidiary of the Tide Water Oil Company.

Upon the conclusion of that work I was idle for a few months and then became associated as a consulting engineer with the then owners of the Dallas and County Gas Companies at Dallas, Texas and of gas leases in the Panola County area of eastern Texas and the Monroe field of Louisiana.

While with these properties I acted as consultant to the Dallas Gas Company and the County Gas Company and I acted as manager of the producing, transmission and distributing properties and gasoline and carbon manufacturing properties in the East Texas field and in the Monroe field. While there I built a carbon black plant, a gasoline plant, certain gathering lines and marketing lines and distribution systems in and near the Monroe field.

I also built a portion of a pipeline from the Monroe [fol. 497] field to Baton Rouge, which line was later sold to the Interstate Natural Gas Company. Also during this period I made investigations of the markets which could be served by pipelines from the Monroe field and reported as to their feasibility.

I reported on projects to pipe natural gas to the Birmingham and Atlanta markets, to Memphis, to New Orleans, to Houston, to Dallas and to other minor markets. Some of these markets were subsequently served from the Monroe field, some of them upon reports which I made and some upon other reports.

In 1927 those properties were sold, the East Texas and the Monroe field properties being acquired by interests affiliated with Electric Bond and Share group. The distribution properties at Dallas went to another organization.

I remained with the properties affiliated with Electric Bond and Share until the fall of 1928 and during that period I participated in negotiations for the piping of natural gas to Memphis. I supervised the construction of the pipeline from Baton Rouge into New Orleans and supervised generally the operations in the field.

In the fall of 1928 I severed my connection with those properties and began business as a consulting engineer at Monroe, Louisiana. The major work which I performed during the year 1928 was to report upon a project of piping [fol. 498] natural gas to Salt Lake City. This line was built upon the basis of my report.

I also made an evaluation of the properties of the then Fort Worth Gas Company, a distribution system at Fort Worth and testified as to those valuations before the Federal Court at Fort Worth.

About the first of January, 1929 I became consulting engineer to the Southern Natural Gas Company who projected a pipeline system from the Monroe fields to Birmingham and Atlanta and other points and I acted as consultant to Southern Natural Gas Corporation during that construction period of 1929, 1930 and the first half of 1931.

In the fall of 1931 I moved my office to Dallas, Texas and have been located there ever since. My work since that date has been largely in connection with valuation of properties in connection with rate cases.

I have recently, however been engaged by Phillips Petroleum Company in connection with a projected natural gas pipeline company from the Panhandle fields of Texas

and the Hugoton fields of Kansas, Oklahoma and Texas into the southeastern Wisconsin areas and have made estimates and reports to them thereon and appeared before the Federal Power Commission and the Public Service Commission of Wisconsin in respect to those matters.

Q. In general, then, during the past decade you have, in [fol. 499] the practice of your profession in Dallas, made numerous studies as I understand on the valuation of natural gas properties.

A. I have for a number of the larger gas companies operating in the Southwest.

Q. Such as which companies?

A. Lone Star Gas Company and its affiliates and subsidiaries, the Arkansas Natural Gas Company and its affiliates and subsidiaries, the Cities Service Gas Company and the United Gas System and for several smaller gas companies operating in that general area.

. . . . . .

(Interposing) I might also mention that I have done some evaluation work and report work for the Natural Gas Pipe Line Company of America.

. . . . . .

The first work which I now recall doing for Panhandle Eastern Pipe Line Company was in March 1937 at which time I made an investigation of the capacity of that system and of what that capacity would be upon the completion of some proposed additions to their transmission and compressing system property.

[fol. 500] Later on in 1937, I partially completed a valuation of those properties and in 1938 I made a complete valuation of the properties of Panhandle Eastern Pipe Line Company and its subsidiary companies.

I also made in 1937 and in 1938 a study of the operating pressures on Panhandle Eastern Pipe Line system to determine the degree of safety in operating that pipeline system at a maximum pressure at compressor stations of 500 pounds and reported to the Panhandle Eastern Pipe Line Company my findings thereon.

I also made in 1937 and 1938 an investigation of the amounts which Panhandle Eastern Pipe Line Company

was accruing annually in its reserve account for the purposes of depreciation and depletion and amortization and reported thereon and have made subsequent check studies on that matter.

I have also upon several occasions since 1937 made certificates requisite in connection with financing. Some of these certificates appear in registration statements filed with the Securities and Exchange Commission.

I think that covers, generally, the work which I have done up to the preparation of a valuation of the plant property and business as of June 30, 1941 which work has just been completed.

Q. And is the document which I now show you a re- [fol. 501] port covering the work which you just mentioned? A. It is.

Trial Examiner: This large document containing 968 pages and entitled "Panhandle Eastern Pipe Line Company and Subsidiary Companies, Reproduction Cost New of Plant Property and Business as of June 30, 1941, P. McDonald Biddison, Consulting Engineer, Dallas, Texas," will be marked for identification as Exhibit 39.

Q. Was the document which has been identified as Exhibit 39 prepared by you and under your direction, Mr. Biddison? A. It was.

Q. And in your opinion does it correctly show what it purports to show? A. It does.

. . . . . .

[fol. 510] Q. Mr. Biddison, at the conclusion of the hearing yesterday afternoon, I think you had just identified the document which has been offered for identification in this record as Exhibit No. 39. Does that document contain a letter of transmittal from you and, if so, where is that to be found and what does that letter contain?

A. The letter is page 1 of the exhibit. It identifies the work as being my work.

Q. And do you state a conclusion in that letter?

A. Yes, the conclusion is that the cost of reproduction new of the consolidated plant property and business of Panhandle Eastern Pipe Line Company and subsidiary companies of June 30, 1941, is $85,262,766.09.

I wish to explain in reference to the subsidiary companies that they are represented by a single company, Illinois Natural Gas Company, owning certain properties in the State of Illinois.

Q. And the data, Mr. Biddison, in respect to that company, as well as the data in respect to Panhandle Eastern Pipe Line Company, as such, is included, is it, in the [fol. 511] material which is contained in Exhibit 39?

A. Yes, as if they were one corporation.

Q. Now, Mr. Biddison, will you turn to page 967 of Exhibit 39 for identification and also page 968 and will you tell us whether these two pages contain an index by the consultation of which the data which you have included in this large exhibit on individual items and units of this property can be found?

A. Yes, it does, and the main subdivisions of the index correspond to the main subdivisions of the summary and of the body of the report.

Q. Now, having drawn the attention of counsel and parties here to the index, I wish you would return now to page 2 of Exhibit 39 for identification.

A. Page 2 contains a summary of the estimate by main property divisions, production system, transmission system, gasoline system, general system and certain other additional values beyond those of the four main general groups of property showing, in toto, in Column C, in line 36 the reproduction cost new of the plant property and business in the amount of $85,262,766.09.

Q. That is the figure which you included in your letter of transmittal on page 1, is it?

A. That is correct and the various subtotals shown on page 2 are developed by property groups in subsequent [fol. 512] pages of the report.

Q. Now, Mr. Biddison, I wish you would turn to page 3 which is headed "Panhandle Eastern Pipe Line Company and Subsidiary Companies' Production System Property Summary," and in general outline tell us what you have done and what is included in this exhibit with respect to production system property.

A. On page 3 are shown five groups of property included as production system property. For each of those groups there follows in subsequent pages the detail. Pro-

duction system land shown on page 3 in the amount of $971.02 is detailed on page 4. It consists of two tracts which are described on that page, the first one in the amount of $299, the second in the amount of $672.02, producing a total of $971.02, which is carried forward to page 3.

The next group of property, beginning on page 5 is leaseholds, which is shown on page 3 amounting to $8,695,524. These leases are set out on page 5 by classifications and as to locations.

This data, in toto, is taken from the report, an estimate by Mr. R. J. Wallace, which has been previously testified to by him and placed in evidence in this case as an exhibit.

Q. Now, will you turn to the next item which is "Production System Gas Wells and Equipment"?

[fol. 513] A. This is shown on page 3 in the amount of $2,053,884.39 and is detailed beginning on page 7.

Q. Well, the total is shown on page 6, is it not, or in the recapitulation?

A. There is a recapitulation of gas wells on page 6, that is correct.

* * * * * * * * *

Beginning on page 7, is shown the details of gas wells. For each gas well I have shown the amount of pipe and casing in the well. This data has been taken from the plant and equipment records of Panhandle Eastern Pipe Line Company and compared with the records on file in the production department of Panhandle Eastern Pipe Line Company.

With respect to the first well, Sanford No. 1-4, showing, in the beginning at line 2 on page 7, there are 82 feet of 24-inch surface pipe, 2,245 feet of 10 3/4-inch casing, 122 feet of 6 5/8 casing. This pipe and casing has been priced out at the prices f. o. b. mill for pipe and casing current as of June 30, 1941.

I have made an analysis of gas wells drilled in the Panhandle field under contract for Panhandle Eastern Pipe Line Company in 1940 and 1941 and I have found from an analysis of those jobs that the valves and fittings priced

at the fittings prices as of June 30, 1941 amounted to [fol. 514] $416.84 per well on the average. I have therefore applied to each well in the Panhandle field of Texas that price for the valves and fittings on a well.

This same analysis showed that for the work done by the contractor in drilling a well, the cost was $2.83 for each foot of depth of the well, I have, therefore, applied in the case of this Sanford No. 1-4 well a price of $2.83 to the total depth of 3,100 feet to arrive at the costs for the drilling contract on this well.

In addition to those costs there are some costs incurred by the owning company, some miscellaneous hauling, some rigging expense, some water supply expense and some fuel expense.

The same analysis previously referred to shows that where a well is not acidized that expense amounted to $3,979.32.

Q. That is on the average per well?

A. As used at line 26 on page 7 and where the well was acidized, that cost amounted to $5,468.62 as shown at line 8 on page 7, the Sanford well having been acidized and the Masterson well not having been acidized.

Q. Now those figures that you have just mentioned are averages per well drilled. Is that true?

A. That is correct, taken from the analysis of wells drilled in 1940 and 1941 under contract.

* * * * * * * *

[fol. 515] Q. Well, Mr. Biddison, what I have in mind is that from pages 7 to 19, inclusive, you have included the individual analysis of the wells of the company in the Panhandle field of Texas, have you not?

A. That is correct and on page 19 I have taken a subtotal at line 26 of $944,628.76. To this subtotal I have added an item to cover stores expense, the expense of accounting for materials in the field, the receipt of materials and their disbursements and accounting.

This stores expense amounts to 1 percent on pipe and casing and to 4 per cent on miscellaneous valves, fittings and other materials. Then I have added the amount of

freight on the casing, there being 52,840.3 hundredweight of pipe and casing at a 92 cents freight rate, making the freight for these Texas wells amount to $48,613.08 and making the total wells in the Panhandle field, as shown at line 29 on page 19, $996,481.52.

Q. That is also shown, is it not, Mr. Biddison, on page 6, your recapitulation?

[fol. 516] A. Yes, sir, that figure is carried forward to page 6.

Q. All right, now will you turn to page 20 and state what you did with respect to the gas wells in the Hugoton field of Kansas?

A. Beginning on page 20 and continuing through to page 36, I have evaluated the gas wells in the Hugoton field of Kansas in precisely the same manner that I have related for the wells in the Panhandle field of Texas, and on page 36 I have arrived at the total, line 5, of $1,041,824.06 which has been carried forward to the—

* * * * * * * * *

I wish to explain with regard to these wells in the Hugoton field in Kansas that some of these wells are partnership wells in which Panhandle Eastern Pipe Line Company owns a one-half interest. That is true, for example, of all the wells on page 20 and the one-half interest is shown and set up and carried into the totals.

Q. That is true with respect to every well as to which this company owns a one-half interest in that field, is it not?

A. That is correct.

* * * * * * * * *

[fol. 517] Q. Well, will you turn, then, to page 37 which discusses the gas wells? There is a recapitulation apparently of the gas wells of the local area and will you state what you did in that connection?

A. There is an area close to Kansas City, south of Kansas City of shallow gas production in which for some 12 or 13 years Panhandle Eastern Pipe Line Company or predecessor owners have been producing and marketing natural gas. Panhandle Eastern Pipe Line Company has

remaining 22 wells in this area, 11 in Kansas and 11 in Missouri. On pages 38 and 39 I have listed those wells.

The amounts which I have set out as their reproduction cost new are their original cost. They are not the figures now on the books as the cost of Panhandle Eastern, but are the cost to a predecessor company as shown by books of that predecessor company.

Q. In other words, with respect to the wells of the so-called local system you have used the original cost and have shown that total on page 37, also bringing it back in recapitulation to page 6, is that true?

A. That is correct. These wells will show a very small value when these amounts are reduced to present [fol. 518] value I don't think it makes much difference what you start with on property of that class.

. . . . . .

Q. Now, Mr. Biddison, the total shown on page 6, your recapitulation for gas wells, is the total, is it not; shown on line 3 of page 3, the summary of your reproduction system property estimates?

A. It is.

Q. Now, will you turn to page 40, whereon you summarize your estimates with respect to other production system structures and state what that shows and what you did?

A. Production system structures are shown in summary form on page 40 and in detail in subsequent pages up to and including page 44. They consist of cottages and warehouses and appurtenant structures at three locations. Two of these locations are in the Panhandle field of Texas for the use of the production forces and one it as Hugoton, Kansas, in the Hugoton field.

The first item on page 41 is the warehouse structure at the Fritch Camp. This item has been estimated in detail from its component parts, and as a completed item I have estimated it, as shown on line 12, at $3,231.27. Incidentally, that is slightly under 13 cents per cubic foot of content. [fol. 519] The next item are the cottages located at this point. These cottages have been priced at $3,830 each, based upon a recently completed contract for similar cot-

tages at the Sneed compressor station a few miles distant and in the Panhandle field of Texas.

The garage in similar fashion has been estimated from the cost, under a contract, for recently completed garage at Sneed Camp.

The tool house has been estimated on the basis of the cost per cubic foot of structures of this type. The balance of the various items have been partially taken at the costs for similar work incurred under recently completed contracts at Sneed station and for some minor miscellaneous items they have been taken at the figures shown by the books.

Q. And the total is shown on page 42, is it not?

A. That is correct, at $20,940.23 for the structures at the Fritch warehouse site.

Q. Now will you proceed to the next item which is the Zofness Camp in Texas and state what you did?

A. The items at the Zofness Camp have been handled in the same fashion as I have related for the items at the Fritch warehouse site, as have also the items for the Hugoton Camp beginning on line 13, page 43.

[fol. 520] Q. And you have shown a summary on page 40, have you not, line 7 of the total of other production system structures and have carried that forward in your general summary of other production system structures on page 3 in the amount of $42,188.75?

A. That is correct.

Q. Now, will you proceed to the item of drilling and clean-out equipment?

A. This is the equipment for cleaning out and reconditioning gas wells. The amounts shown are the amounts carried upon the books of the company for that equipment. A considerable amount of such equipment has been retired within the last two or three years and this is the selected equipment out of a considerably larger original amount.

Q. This is the equipment that is still in use, is it?

A. That is correct.

Q. Now, the total for that figure shown on page 48 and brought forward on line 3 on page 45 is the same total, is it not, as is carried on line 5 of page 3, your summary production system property?

A. That is correct and the sum total from page 3 of $10,813,244.62 has been carried forward to the corresponding item on line 7 of page 2.

. . . . . .

[fol. 521] Q. Well, Mr. Biddison, now will you turn to page 49 on which appears a summary of your reproduction cost new estimates in respect of transmission system property in the amount of fifty-five odd million dollars and tell us whether that is the same amount that you have carried at line 17 of page 2?

A. It is.

Q. Now, will you proceed to discuss what you did in your estimates with respect to each of the items of transmission system property?

A. Transmission system property constitutes the largest single group of property in this valuation. The first item shown on page 49 at line 1 is transmission system land in the amount of $55,909.84. That total is carried [fol. 522] forward to line 8 on page 50 which is a summary of transmission system land.

The details of transmission system land begin on page 51 and continue to include page 54. All items of transmission system land are taken from the plant and equipment records of Panhandle Eastern Pipe Line Company and the Illinois Natural Gas Company.

I call attention to the fact that on page 51, line 9 and lines 10 and 11, I have listed two parcels of land which are not in use and have deducted them from the gross amount of land to arrive at the net figure of $55,909.84 for land.

Q. Well, is that net figure the cost shown on the books of the company for the parcels of land in question?

A. It is. I have used the cost as shown on the books because I believe that for land and for rights-of-way that the costs actually incurred are the best obtainable measure of what would be incurred under reproduction.

Q. Now, Mr. Biddison, will you turn to page 55 and state what you have done with respect to rights-of-way, the discussion which I believe continues to and including page 71?

A. On page 55 I have shown a summary for rights-of-way. I call attention to the fact that under transmission system rights-of-way I have included rights-of-way for [fol. 523] well lines as well as for the main lines, whereas under the prescribed classification of accounts some of these rights-of-way would be under the division of production property and some would be under the division of the communication system. I have them all in this one classification beginning on page 55 at a total shown on line 13 of page 56 of $1,278,521.36. These figures are all taken from the records and are the cost to Panhandle Eastern Pipe Line Company for those items. The total amount has been carried forward to line 2 on page 49.

Q. Also line 10 on page 2, has it not? A. Yes, sir.

* * * * * * * * *

The next item of transmission system property was transmission measuring and regulating station structures. These are the buildings which house the regulating and measuring equipment. These structures are summarized on page 72 for a total, as shown by line 35, of $104,475.27. They are detailed in subsequent pages up to and including page 139.

It may be noted on page 73 that the first item has to do with structures for production measuring stations in Texas, buildings constructed after a standard drawing No. 4,182, that specification being on line 2 of this page.

[fol. 524] In this field there are 55 such buildings, six-foot by eight-foot by seven-foot as shown on lines 7 and 8 and one similar one, eight-foot by ten-foot by seven-foot.

The standard building six by eight by seven has been estimated in detail at current prices for the materials therein and for the labor for such construction and that price has been applied to the 55 buildings. A corresponding price per cubic foot has then been applied to the other building at lines 9 and 10.

Following on page 74 is a listing of the buildings included in the 56 buildings shown on page 73.

Q. Now, does somewhat the same procedure follow with respect to the buildings added on page 76?

A. That is correct, those buildings are for the housing of equipment to measure gas produced in the Hugoton field in Kansas. On page 76 is shown the value at line 8 for 65 such buildings and the buildings are subsequently listed on pages 77 and 78.

Q. Have you done the same thing with respect to other buildings of this type, beginning on page 79 and following through to the end of this discussion on page 139?

A. That is correct.

. . . . . .

[fol. 525] A. I might explain further that beginning on page 83 the process is repeated for those structures housing measuring equipment which measures gas purchased in the Texas field, and on page 85 are shown the values for the building, housing equipment, measuring gas purchased in Oklahoma, and on page 87 is shown the value for the structures housing the equipment, measuring purchased gas in Kansas, and on page 90 we have a similar statement for the purchased gas stations in the local area of Kansas, and on page 97 similarly the buildings for the purchased gas stations in the local area in Missouri.

Q. And similarly for all the other items down to and including those covered on page 139, Mr. Biddison, you followed the same procedure, did you?

A. That is correct.

Q. And you have shown your total on page 72, which has been brought forward, has it not, to page 49 and then to the final summary on page 2?

A. That is correct.

. . . . . .

Q. Now, will you turn to the next item which is headed "Other Transmission System Structures," beginning on page 140 and state what you have done with respect to those structures?

[fol. 526] On page 140 is the summary of other transmission system structures amounting to $382,920.59 as shown at line 29. That amount has been carried forward to page 49.

Q. And page 2, also, Mr. Biddison?

A. And to page 2.

The items covered are the residences at compressor stations and various warehouses along the system for the use of the transmission department, these warehouses carrying supplies for current operations as well as equipment and supplies for emergency work. The detail begins at page 141 and continues to include page 154.

Q. These include only the structures here, do they not, and not the equipment contained in them?

A. That is correct. The item is named "Other Transmission System Structures" and it is the structures that are included, not the supplies or the equipment.

These structures as to cottages have been priced on the basis of the cost of similar structures recently completed at compressor stations.

As to garages, they have also been priced on the basis of the contract price for garages completed in 1940 and '41 of similar types.

The other miscellaneous items in these camps at the [fol. 527] various compressor stations have been taken from cost recorded in the plant equipment record of the Panhandle Eastern Pipe Line Company.

* * * * * * * * *

[fol. 528] I was going to explain that with reference to some of these warehouse buildings, like those shown on page 147 and page 148, that they have been priced on the basis of 12.82 cents per cubic foot, based upon the detailed estimate for a similar structure at the Fritch warehouse site.

I think with those explanations I have given enough to show the method used in the determination of values for other transmission system structures.

Q. Now, Mr. Biddison, turning to page 155, which is headed "Summary—Transmission Measuring and Regulating Station Equipment," and which shows a total of $491,685.32, as also carried back to line 5 of page 49 and to line 13 of page 2, will you please state what you have done with respect to this particular class of property?

A. On page 156 I have shown the measuring stations which measure gas produced by Panhandle Eastern in Texas.

There are 11 measuring stations whose valves and fittings correspond to Standard Drawing No. 4143, and 46 whose valves and fittings correspond to Standard Drawing No. 4144.

I have determined that the valves and fittings called for by Drawing 4143, priced at prices as of June 30, 1941, at [fol. 529] the discounts from catalog prices at which Panhandle Eastern is currently buying this class of equipment, amounts to $233.13 per installation; that the valves and fittings called for by Drawing 4144 correspondingly cost $339.19.

Q. Per installation? A. Per installation.

That of these 57 stations, 37 of them have the type of clock shown by line 8 on page 156, and 13 have the type of clock in the meter as shown by line 9—

Q. (Interposing) I think you misspoke yourself, Mr. Biddison. There are 34 that have the type of clock shown on line 8 instead of 37?

A. 34 is the correct figure.

(Continuing) And similarly as to other items as shown on that page.

Pricing these stations out on this basis, I derive, at line 22, a total amount of $36,864.26. Those stations are listed, then, on page 157 and page 158, those pages showing whether the stations conform as to valves and fittings to Drawing 4143 or to Drawing 4144.

Q. And the total you have carried back on to your summary page 155, have you not, line 2?

A. That is correct.

I might add that I have shown, on page 156, an item of [fol. 530] stores expense, at line 21, which is 4 per cent of the materials included in the tabulation on page 156.

That figure is the figure which I have determined to be the usual cost for accounting for stores in the field, from a study of that expense as incurred by the Lone Star Gas Company system and the system of the Arkansas-Louisiana Gas Company.

Q. Now, the next item is "Hugoton field, transmission measuring and regulating station equipment," is it not?

A. Yes.

Q. Starting at page 159?

A. Yes, sir; and that is handled in the same fashion as I have described for the production stations in the Texas field.

Beginning at page 162, I have handled the production stations in the local field, on the Kansas side, in the same fashion; and at page 164 the production stations for the local area, on the Missouri side, in the same fashion.

Now, other classifications of measuring stations throughout have been handled in identically the same manner.

Including all the various points and at the various localities.

* * * * * * * * *

[fol. 531] Q. Now, will you turn, then, to page 351, Mr. Biddison, at which point you have included a summary of transmission mains?

Let me ask you in that connection whether the total of $43,025,965.41, shown at the bottom of that page, is the same total shown and carried forward by you to line 6 of page 49, your summary of said transmission system property and to line 14 of page 2, your summary of your entire reproduction cost estimate? A. It is.

Q. Now, will you proceed to discuss what you did with respect to transmission mains?

A. The first group shown on the summary, page 351, is well lines. Well lines have been shown in a recapitulated form on page 352, and beginning on page 353 the well [fol. 532] lines to wells owned by Panhandle Eastern Pipe Line Company, in Texas, are listed by their number as they appear of record.

In column A is shown the line number, the line size, and the weight of pipe in the line;

In column B is shown the number of feet in that line;

In column C is designated the unit to which the quantity in column B applies;

In column D is shown the unit cost per cubic foot of pipe, f. o. b. mill—

. . . . . .

Per lineal foot. F. o. b. mill.

(Continuing) In column E the quantity in column B has been extended at the price in column D to produce the amounts in column E.

. . . . . .

[fol. 533] Now, where did you obtain the prices which you used under column D?

A. Those prices are the carload list prices with the discounts properly applying as of June [31] 1941. (Pause)

. . . . . .

This list is National Tube List No. 14, of July 1, 1938.

. . . . . .

Continuing on to page 354, on line 32 I have taken off a subtotal of the materials required to construct these lines, in the amount of $65,837.80, as shown at line 32. To that I have added an allowance for stores expense, which is 1 percent on pipe and 4 per cent on the other materials shown on line 33, which produces line 34, the subtotal of materials and stores. I have then continued with an estimate of the cost to install these materials.

Q. How did you arrive at that estimate?

A. These estimates of the cost to install are based upon [fol. 534] contract prices recently paid by Panhandle Eastern Pipe Line Company in that area for similar work.

. . . . . .

I have estimated, as shown by line 37, that the 4½ inch lines would be laid under contract price at 13 cents per foot, and that the 6⅝ lines would be laid at 18 cents per foot.

I have subsequently shown an estimate of cost of installation of the valves and of the cost of painting the lines, and have arrived at a subtotal, as shown on line 5 of page 355, for installation of those lines of $15,529.41.

I have then computed the freight on this pipe into that area at the freight rates in effect as of the valuation date. As shown on line 8, page 355, the freight on the 4½ inch pipe would be $3,712.51, and on the 6⅝ pipe, shown on line 9, $6,245.40.

I have thereby produced a total for the production well lines in Texas, as shown by line 11, page 355, of $61,750.29.

Upon re-examination of this total, I find that there should have been an allowance in the case of each of these lines for making the connection to the line to which it joins. This has not been included.

. . . . . .

[fol. 535] The next item is similar in character, beginning on page 357, and covers production well lines in Kansas, Western Kansas, that is, in the Hugoton field.

Those lines were handled in exactly the same fashion as I have related for the production well lines in Texas.

Then, if you refer to page 351 you will find that the next page group is the gathering lines. This system of lines takes gas from the smaller well lines into a system of larger lines verging toward a central point.

. . . . . .

With respect to gathering lines, as illustrated on page 363, I have set forth in respect to each line the pipe, valves, fittings and other materials in that line.

This data is taken from the plant and equipment records and the engineering department records and the engineer-[fol. 536] ing department maps of Panhandle Eastern Pipe Line Company. All those sources have been used in the compilation of the inventory of this equipment.

I have also had access to the field notes of the engineering department for cross checking on some items where it was required.

. . . . . .

Now, beginning on page 389, for those same Texas gathering lines, I have shown the estimate of the cost of installation, taking each line as an individual unit in the same fashion as I have previously set forth the materials in that line.

The estimated installation costs are based upon recent contract work of a similar nature performed for Panhandle Eastern Pipe Line Company by contractors. The [fol. 537] estimate of the installation cost continues to include page 405, where at line 9 the installation cost on Texas gathering lines is shown to be $235,828.43.

Then, continuing on page 406, I have shown the freight on pipe in these Texas gathering lines, by sizes and quantities, the total being shown on line 19 at $180,308.36.

Following, on page 407, still in the Texas gathering line group, we have a river crossing of the Canadian River, which is estimated in detail, as shown by line 20 on page 408, at $61,010.35; and on this same page, 408, at line 21 is shown the total cost for Texas gathering lines of $1,249,988.32, which is the item carried forward to line 1 of page 362.

* * * * * * * *

Beginning on page 409, we have Kansas gathering lines. These have been handled in precisely the same fashion as the Texas gathering lines, and in that fashion I have arrived, on page 455, at line 22, at the total of $2,011,397.67, which is carried forward to line 2, page 362.

* * * * * * * * *

Beginning on page 456 is another group of still larger gas mains, bringing gas from the gathering lines through these trunk gathering lines into the initial compressor stations. One of these trunk gathering lines extends from Liberal station down to Sneed station, a 22-inch line. On [fol. 538] page 456 there is shown a recapitulation with the values shown by States, in the amount of $2,630,583.49.

Beginning on page 457 is detailed the trunk gathering lines in Texas, this being a 22-inch line starting at Sneed station and running eventually to Liberal station, across the panhandle of Oklahoma and into the State of Kansas.

On page 457 has been listed the materials; and at line 36 is shown the subtotal to include stores expense on pipe and fittings of $844,159.59 for the portion of that line in Texas.

On page 458, lines 1 to 15, is shown the detail of the installation cost of that same Texas portion of that 22-inch line, with the subtotal at line 16 for installation, of $278,110.25.

There follows a calculation of the freight on pipe and couplings; and at line 26 I have arrived at the total reproduction cost of the Texas portion of that 22-inch line, in the amount of $1,348,066.85.

The installation costs, as shown on page 458, are arrived at from an analysis of the contract prices at which work has recently been performed for Panhandle Eastern Pipe Line Company. The pipe is based upon a schedule of pipe prices for such sizes which I believe to be the prices obtaining as of June 30, 1941. Pipe prices have recently been advancing. Panhandle Eastern Pipe Line Company [fol. 539] has been negotiating for the purchase of pipe for additional loop lines and for extensions to its system in southern Michigan and northern Indiana, and from consideration of the information derived in making those purchases I have fixed a schedule of pipe prices for pipe over 16 inches in diameter for main line use, which is as follows:

16-inch—lapweld, $65; electric weld, $67; seamless, $68.

18-inch—lapweld, $64.50; electric weld, $66.50; seamless, $67.50.

20-inch—lapweld, $62; electric weld, $64; seamless, $65.

22-inch—lapweld, $62; electric weld, $64; seamless, $65—

(Continuing) 24-inch—lapweld, $62; electric weld, $64; seamless, $65.

26-inch—lapweld, $62; electric weld, $64; seamless, $65.

28-inch—lapweld, $62; electric weld, $64; seamless, $65.

All these prices are prices per ton, based upon Lorain freights without further discount for cash.

The prices which I have used on smaller pipe, as I have [fol. 540] previously pointed out, are based upon carload list with the applicable discounts, which do include 2 percent discount for cash.

Q. Do you believe that the prices that you have just adopted are fair and reasonable prices under your assumptions?

A. I do; I believe they are the minimum prices at which pipe could have been purchased June 30, 1941.

Q. When you speak of Lorain, what do you refer to?

A. I mean that those prices will be so adjusted that whether the pipe be shipped out of Lorain or Milwaukee, that the net delivered prices will be these prices per ton plus freight from Lorain.

Q. That is a common practice in the industry, is it?

A. It was a common practice. It has been deviated from to some extent in the last five or six years; but that is evidently the basis on which pipe will now be purchased for Panhandle Eastern.

The actual tonnage rates may prove to be somewhat higher than I have given when the order is finally placed.

. . . . . .

[fol. 541] I have recited my schedule of pipe prices used throughout in this tabulation.

. . . . . .

Well, at page 458 I have arrived at the total of the Texas portion of this 22-inch line.

Now, that same line continues across Oklahoma, and the Oklahoma portion of it is shown in subsequent pages, the total for Oklahoma being on page 460. Beginning on page 461, I have detailed a river crossing on that line, the total for that river crossing being on page 462.

I have then continued with the Kansas portion of that line, the Kansas portion being shown for its total on page 464; and an additional river crossing shown in total on page 466.

. . . . . .

[fol. 542] Now, on page 467, in column A, I have given a description of the main units into which the main lines of Panhandle Eastern Pipe Line Company may be divided.

At line 2 is the designation "Kansas Line 100." This is the Kansas portion of the original main line.

The Kansas portion of the loop line is designated in line 7 as "Kansas Line 200", and that has been estimated by sections, the Liberal loop for example being the section between Liberal station and Greensburg station, the Greensburg loop following in order, being that loop between the Greensburg station and Haven station. In general, the loop is designated by the compressor station which precedes it.

On page 468 the recapitulation of the main lines is completed, showing a total, at line 14, of $29,395,674.68; and [fol. 543] in subsequent pages the items shown in the recapitulation are detailed.

Beginning on page 469, I have detailed the Kansas main line No. 100, the original line. The materials are listed down to line 8 on page 470, after which is added the stores expense, amounting to 1 percent on the pipe and 4 percent on the other materials, to produce the subtotals of materials and stores at line 10.

Following this is the estimate of the costs of installation, these costs being based upon an analysis of contract prices for work recently done or bids on work now authorized to be done.

Q. In that same general area? A. Yes, sir.

Q. Now, on page 471, have you added an item for freight?

A. I have, because the items for pipe as shown on page 469 are for pipe f.o.b. mill; therefore, on page 471 is a calculation of the freight on this pipe, and at line 36 I arrive at the total installed cost of the Kansas portion of the original line, in the amount of $7,821,020.61.

Q. Would it be fair to say, Mr. Biddison, that with respect to each of the other items that you have mentioned in connection with the main transmission line, that you have followed a similar process?

A. That is correct.

[fol. 544] I have estimated the river crossings, for example, the Arkansas river crossing, beginning on page 472, —I have estimated that upon the basis of contract prices for construction. These jobs were done in 1937, or earlier, and in general on these river crossings I have used the contract costs incurred in that 1936 and 1937 construction on river crossings, without any substantial modification.

I realize that the costs have materially increased for the labor in performance of that class of work, but time has not permitted to make the adjustment on account of the detail work that would be required to do that.

Q. And those items have been included in the cost?

A. Such items as I have for increased cost must come in my allowance for miscellaneous construction expenditures and omissions.

I think the explanation which I have made will cover the balance of the whole grouping of transmission mains.

[fol. 545] On page 774, I have shown, in summary, the costs of compressor station property. I have shown there the cost for each of the compressor stations owned and operated by Panhandle Eastern Pipe Line Company. In subsequent pages each of those stations is detailed.

In estimating the cost of these compressor stations, I have used the analysis of the contractor's charges to the Panhandle Eastern for a distribution of the contractor's direct costs. Certain of the equipment in these stations, practically all the work having been done by contract, was purchased by Panhandle Eastern Pipe Line Company and furnished to the contractor under the terms of the construction contract. This includes such items as the main engines, the auxiliary engines and their connected generators, water pumps, water tank, air compressor, structural steel for the main building, and some other items.

I have then re-priced these major items of main engines, compressor stations, main buildings, water tanks, on the basis of the present-day costs for that class of material, as shown by recent purchases by Panhandle Eastern Pipe Line Company for construction work now in progress, and for the balance of the work on these compressor sta-

tions have used the distributed costs as reflected on the Panhandle Eastern records and as furnished by the contractors, and to the work performed by the contractor have added 20 percent to cover the contractor's overheads and [fol. 546] profits, this 20 percent being arrived at by an analysis of the residue of undistributed charges in this allocation made by the contractors upon completion of the installations.

* * * * * * * * *

Q. All right.

And the compressor station total is carried forward to line 15 of page 2, is it not?

A. It is, in the amount of $9,792,271.60.

Q. Now, Mr. Biddison, turning to your next item, which is that of "Other Transmission System Equipment", as shown in total on line 16 of page 2, let me ask you whether that is discussed, commencing at page 837 and ending at page 926 of your Exhibit No. 39 for identification?

A. It is.

* * * * * * * *

On page 837, the items of Liberal boarding house equipment; domestic water well, Louisburg; air and gas line to laboratory, Louisburg; domestic water pump, Liberal; lake barge, Louisburg; pressure alarm gauges; Sneed boarding house equipment; Hansford boarding house equipment; [fol. 547] gas scrubbers—

* * * * * * * * *

(Continuing)—have been taken from the books. These are miscellaneous items, not of great value, and I have taken the book statement for them.

The items of cathodic protection installation are mostly of very recent construction, and they have also been taken at the amounts shown by the books.

On cattle guards, I have a field inventory taken, and that item has been estimated in detail from that field inventory.

The same is true on fence gates on leases.

At line 13 is shown emergency pipe racks and equipment, in the amount of $67,066.35.

These emergency pipe racks are located along the main lines at points where they will be accessible so material may be had for emergency repair work.

I call particular attention to them because a great deal of the value in this item consists of material, but this is not material which is included in the item of materials and supplies on hand used as an item in working capital, as testified to by Mr. Sperry.

The location of these pipe racks and the equipment on them is detailed on pages 842 to 926, inclusive, and as summarized on page 841.

. . . . . .

[fol. 548] Q. Now, will you turn to the next item, which is "Gasoline Production System Property", a summary of which is shown at page 927, and state what you did in that connection?

A. Liberal gasoline plant was constructed partly in 1936 and partly in 1937. It is true that labor cost has advanced since that date, and it is also true that the costs of a great deal of the equipment in that plant are higher today than they were when the plant was built; but the figures which I have shown for Liberal gasoline plant, beginning at page 927 and continuing to 933, are an allocation to the accounts which I have used of costs determined from the books of Panhandle Eastern Pipe Line Company.

. . . . . .

Under "General System Property", as shown on page 934, there is included general office equipment, general transportation equipment, general laboratory equipment, general communication equipment, and general tools and implements. With the exception of general communication equipment, which has been estimated in detail from an inventory completed about June 1, 1940, the items of general [fol. 549] property have been taken at the stated values shown on the books of Panhandle Eastern Pipe Line Company.

Q. And the total is $727,565.12, is it?

A. That is correct.

Q. As carried forward on page 2?
A. That is correct.

. . . . . .

Q. And was not the inventory with respect to that communication equipment completed in June of 1941 instead of 1940?
A. 1941 is the correct figure. If I said 1940, it was an error.

. . . . . .

Q. Then, turning back to page 2 for a moment, you have your total of direct construction costs, shown on line 28 of that page, covering all the items you have been describing, is that true?
A. Yes, sir, at line 28 I show total direct construction costs of $67,422,726.85.
Q. And the detail with respect to all of those items is [fol. 550] included on the pages of the exhibit from 3 to 955 inclusive, is it not? A. That is correct.
Q. Now, will you turn to page 956, which is headed "Intangible Fixed Capital", and state what that covers?
A. It covers the item of preliminary and organization expense, that cost which would be incurred in organizing the company to do business, getting its charters and permits and in reaching a decision as to whether to proceed with the project.

It involves the expenditure of money for geological investigations and engineering investigations and reports, as well as the salaries and expenses of the promoters of the enterprise during the preliminary stage and before financing is completed and construction work started.

Q. And you used three quarters of one per cent for that item, did you?
A. Yes, sir. That is my estimate of what it would cost to duplicate the services that have been performed in that respect.
Q. Now, will you turn to page 957, headed "Undistributed Construction Expenditures", and state what is covered by that item?
A. Under this group I have included administrative expense during the construction period, law expense during [fol. 551] the construction period, engineering and super-

vision of construction, taxes during construction, interest during construction, and miscellaneous construction expenditures and omissions. The total of these, as shown on page 957, is $7,781,764.69.

. . . . . .

I might add to that explanation that with respect to interest during construction, I have assumed a two-year construction period, substantially that the original line would be built in one construction period and the loops in the second construction period.

Q. Do you believe that to be a reasonable assumption, based on your experience?

A. I do. It would be a big construction period for each of the two periods.

Q. Now, will you turn to page 962, where you commence a statement of construction work in progress, and state what that covers?

A. I have listed what is recorded on the books as con- [fol. 552] struction work in progress, beginning on page 962, which is a total, as shown on line 2, page 963, of $383,556.82; but of that work in progress, as shown by the books, certain items were completed and in use and were therefore included by me in the property accounts which I have evaluated. Those items are listed on page 963, line 3 to line 26, inclusive, for a total, as shown by line 27, of $233,887.20, so that there is work in progress not included by me in the direct plant accounts to the extent of that shown on line 28 of $149,669.62.

Q. That is of June 30 of this year?

A. That is correct.

Q. Now, will you turn to page 964, which you have headed "Working Capital," and explain what you did there?

A. The amounts shown on this page are amounts as estimated by Mr. L. F. Sperry, treasurer of Panhandle Eastern Pipe Line Company, and as testified to by him in this proceeding.

Q. You have taken the figures which Mr. Sperry developed and testified to, have you not?

A. Yes, sir.

. . . . . .

[fol. 554] Q. Now, will you turn to page 966 which you [fol. 555] have headed: "Cost of Business Development", and tell us what is included on that page?

A. Upon the completion of a natural gas line, business does not just walk down the street and attach itself. It takes effort to attach business. It takes time to attach business and costs money to attach business.

Q. Is there usually some lag of that sort?

A. It is almost inevitable. I know of one or two exceptions, where business was immediately attached to substantially the capacity of the system, but those are very rare.

In general, it takes five years or more to develop the business for which a line is constructed.

On this particular system, in order to develop business, and in line with what is being proposed on more recent construction, payments were made to some of the distribution utilities to aid them in their sales campaigns for industrial gas, for house heating gas, and contributions were made to bear part of the cost of their changing over their systems from manufactured gas to natural gas.

I have listed, on page 966, a statement, beginning at line 2 and ending in a total at line 30, of such payments made to utility companies. The purpose of the payment is generally shown.

Q. You mean payments actually made by Panhandle [fol. 556] Eastern Pipe Line Company?

A. Yes, sir.

Q. Where did you get those figures?

A. Those figures were furnished to me by an officer of Panhandle Eastern Pipe Line Company, at my request.

Q. And they total how much?

A. They total $553,992.48.

Q. And is the statement which is shown on page 966 with respect to those particular payments self explanatory? A. Yes, sir.

* * * * * * * *

Now, we come to lines 31 and 32 of page 966. Will you explain the figure you have shown, Mr. Biddison, where you got it, and the reasons why you have included it?

[fol. 557-8] A. Roughly, the capacity of Panhandle Eastern's system was about 80,000,000 cubic feet per day up until early 1937, at which time it became about 125,000,000 cubic feet per day.

Panhandle Eastern would not have been justified in building a smaller line with the expectation of increasing from the 80,000,000 capacity to the 125,000,000 capacity by looping; it simply would not have been economical to have done so. You can make a rough comparison of it on the basis that a single 24-inch line, such as they did build, would cost about $30,000 per mile, and an 18-inch, having, roughly, half the capacity of the 24-inch, would cost about $20,000 a mile; so that the two 18-inch lines would have cost about $40,000 a mile compared to $30,000 per mile for the 24-inch line. The carrying costs on the unused capacity for the larger system would be less than the additional capital and its carrying costs for laying two of the smaller lines. It is almost inherent in the natural gas business that there shall be this lag in the development of the business and for a period of five or more years that you shall have some unused capacity in your system.

Q. And with costs attributable thereto?

A. Yes. If half your system is unused capacity, then half of the fixed charges thereon are attributable to unused capacity. I have used here as carrying costs on that [fol. 559] portion of the plant idle pending development of business, an amount of $5,500,000, predicated upon a determination of the costs of carrying such idle plants made by Mr. Morton in testimony in this hearing, in which he measured that cost by 5 different methods.

Q. You have taken no one of his methods, have you, but have considered them as a whole?

A. That is correct. I have not taken any particular one, nor have I taken the average of all, but having considered them all I have taken $5,500,000 as a measure of that cost of carrying the unused portion of the plant while the business was being developed to such an amount as was contemplated to load the original line.

Q. Now, Mr. Biddison, have you anything further you wish to state about this last item you have been mentioning?

A. Well, I should like to point out definitely that these costs, which are payments made and took money, are not allowed for in any item of my direct construction costs; nor are they allowed for in my item of intangible fixed capital; nor are they allowed for in my item of undistributed construction expenditures; nor are they allowed for in construction work in progress; nor are they allowed for in working capital; nor are they allowed for in the value of gas purchase contracts. They are not allowed for in any way, shape or form, in whole or in part; in any other place in my valuation except where shown as the cost of busi- [fol. 560] ness development.

Q. And they represent real costs and actual money expended on the history of this plant rather than mere past losses?

A. That is correct, and they represent value because they are costs which would be incurred in the reproduction of this property, and they are costs which would be escaped by a purchaser who purchased the property with this business which has been attached by the expenditure of that money.

. . . . . .

Q. Now, Mr. Biddison, will you turn back to page 2 and state whether this last item of cost, to business development has been included in your summary contained on that page?

A. It has been, at line 35, in the amount of $6,053,992.48.

Q. Now, Mr. Biddison, you have shown a total on page 2 of $85,262,766.09. Let me ask you whether this figure, in your opinion, is a fair and reasonable estimate, based upon your experience in this business, of the cost which would be entailed to reproduce the Panhandle Eastern Pipe Line Company's system as of June 30, 1941?

A. It does, with one exception, to which I called attention to, the modification which I propose to make in the value of gas purchase contracts.

. . . . . .

[fol. 562] Trial Examiner: The study of reproduction costs by Mr. Biddison, identified as Exhibit 39, is now of-

fered in evidence; and the ruling as to its admission will be reserved until the completion of cross-examination.

* * * * * * * * *

[fol. 581] Trial Examiner: The hearing will be in order.

* * * * * * * * *

Are there any additional or other appearances today?

* * * * * * * * *

Mr. Gorman: I should like to add for the Commission's counsel the appearance of Mr. Harry S. Littman.

* * * * * * * * *

[fol. 585] P. McDONALD BIDDISON having been previously sworn, resumed the stand and testified further as follows:

Further Direct Examination.

By Mr. Wheat:

Q. Mr. Biddison, since the date of the last hearing, have you prepared certain correction sheets relating to data which you have shown in Exhibit No. 39 for identification?

A. Yes, I have.

Q. Let me ask you whether the group of sheets headed at the outset on the first page "Correction Sheets for Exhibit No. 39" is the group of corrections to which I have just referred?

A. Yes, sir, it is.

Q. And was this group of corrections prepared by you or under your direction. A. Yes, sir.

Mr. Wheat: Mr. Examiner, we have copies here and I think it would be advantageous if this group of corrected sheets rather than being inserted in Exhibit 39 as cor-[fol. 586] rections might be marked Exhibit 39-A for identification, if that meets with your approval.

Trial Examiner: That may be done.

* * * * * * * * *

By Mr. Wheat:

* * * * * * * * *

Q. Now, I wish you would state where you think we should start in your explanation of these corrections?

A. When I testified at a previous session of this hearing with respect to Exhibit No. 39, I stated that I would recompute the value of gas purchase contracts shown on [fol. 587] page 965 of Exhibit 39, using in that computation a higher rate of interest at which to discount the differences between gas cost and gas values. I have done that on page 965 of corrected Exhibit 39-A.

. . . . . .

The differences are in column "F" of the tabulation on the lower half of the page whereby the total value, as shown on page 965 of Exhibit 39, is reduced from $1,779,942 which was arrived at by using a 4 percent interest rate, to a new figure shown on page 965 of Exhibit 39-A of $1,585,914. This latter figure is arrived at by using a discount rate of 7 percent.

. . . . . .

The figure of $1,585,914, which I have just explained, is carried forward to page 2 of Exhibit 39-A at line 34.

. . . . . .

[fol. 588] Q. Now, will you proceed with respect to your compressor station data?

A. Upon examination of Exhibit No. 39 I found that in connection with Tuscola compressor station on page 831 that there had been added into the total from the working papers an item of $23,440 which should have been crossed out on the working papers. Therefore, I have prepared in Exhibit 39-A a corrected page, No. 831, which correction for that error produces a total for Tuscola station of $682,218.43, whereas on page 831 of Exhibit 39, the total was [fol. 589] shown as $710,346.43.

Having made that correction for Tuscola station, the corrected figure from page 831 of the Exhibit 39-A is carried forward into the summary of compressor stations on page 774.

. . . . . .

Q. And that changes the sum total of line 19, does it not?

A. Yes, sir, that changes the total for sheet 774, which in Exhibit 39 was $9,792,271.60 to the figure of $9,764,143.60. That change is reflected in Exhibit 39-A on page 2 at line 15.

Q. That change also makes a change, does it not, on page 2 of the total of transmission system property and of the grand total shown at the bottom of that page, line 36?

A. Yes, it affects those items, but the total changes on page 2 of Exhibit No. 39 are not brought about by the compressor station item carried forward from page 774.

Q. In other words, on page 2 there are corrections other than that in line 15?

A. That is correct.

Q. You have already testified to one in line 34, have you not?

[fol. 590] A. Yes, sir.

* * * * * * * * *

Q. Will you now proceed with the other corrections which you have in mind?

A. On pages 682 and 683 of Exhibit No. 39, there is included some pipe lines from the local-area, that being a gas field near Kansas City, which were set up by a shortcut method and then the method abandoned. The sheets were typed and the totals carried into the valuation.

Pages 682 and 683 should be deleted as the pipelines shown thereon are set up in detail in subsequent pages.

Now, the amount of money affected by this is that shown on page 683 of Exhibit 39 at line 11, $1,065,095.26. To correct for that error there must be correction made on page 669 of Exhibit 39 and I have included in Exhibit 39-A a corrected page 669 in which in this recapitulation the item of $1,065,095.26 is taken out. The new total for local area lines, as shown on corrected page 669 of 39-A is $1,877,681.35 as compared to an original figure on page 669 of Exhibit 39, line 17, of $2,942,776.61.

The new total on corrected page 669 of Exhibit 39-A [fol. 591] is carried forward to corrected page 351 of Ex-

hibit 39-A at line 31. The correction on page 351 then affects the total for mains which in Exhibit No. 39, page 351, line 32, was $43,025,965.41. The corrected total as shown by page 351 of Exhibit 39-A is $41,960,879.15. That total from line 32 is carried forward to page 49 of Exhibit 39-A at line 6.

This correction on page 49 of 39-A, therefore, changes the total for transmission system property at line 90, page 9 of 39-A.

In Exhibit 39 that total was, as shown on line 9, page 49, $55,260,406.88. The new total is $54,167,183.62.

Q. And that is carried over, also, on to page 2, is it not?

A. Yes, sir, that is carried forward to page 2 of Exhibit 39-A at line 17.

Q. That affects the total shown on line 17 of page 2, does it not?

A. It does. It produces at line 17 of page 2 the figure of $54,167,183.62 as compared to the figure on line 17, page 2 of Exhibit 39 of $55,260,406.88.

* * * * * * * *

[fol. 592] On page 38 of Exhibit 39, line 12, there is an error. The figure shown is $91. The figure should have been $991 and I have made that correction at line 12, page 38 of Exhibit 39-A. That correction does not change the totals at line 14 of page 38, Exhibit No. 39.

* * * * * * * *

On page 956 of Exhibit No. 39 I computed preliminary and organization expense at three-quarters of 1 percent upon $67,422,726.85 of direct construction costs.

I arrived at a figure of $505,670.45.

Q. Now, you have changed that figure, have you, by applying the three-quarters of 1 percent to your new direct construction costs?

A. That is correct.

[fol. 593] Q. And is that the figure which appears on corrected sheet 956, to-wit, $497,471.27, the corrected figure which has resulted from that computation?

A. It is. The base upon which three-quarters of 1 percent is computed comes from line 28, page 2 of Exhibit No.

39-A and is $66,329,503.59 and the amount estimated for preliminary and organization expense shown on line 3, page 956 of Exhibit 39-A is carried forward to line 29, intangible fixed capital, page 2 of Exhibit 39-A.

* * * * * * * *

On page 958 of Exhibit 39-A I have recomputed the items of administrative expense, law expense, engineering and supervision and taxes during construction. The rates at which these are computed are the same as those used in the computation in Exhibit No. 39.

However, the base figures to which the ratios are applied in Exhibit No. 39-A are those resulting from the corrections which I have made in the estimates of direct construction cost and they appear in column "D" on page 958 of Exhibit 39-A and may be compared with the similar items in Exhibit No. 39 or from the summary sheets of the individual classifications of property.

[fol. 594] The amounts computed for these elements of the undistributed construction expenditure, namely, administrative expense, law expense, engineering and supervision and taxes during construction are carried forward from page 958 to page 957 of that same exhibit at lines 1, 2, 3, and 4.

In a similar manner I have made correction on pages 959 and 960 for the item of interest during construction, using in this computation for amounts in column "C" the corrected amounts of direct construction cost which I have today explained, and I arrive on page 960 at line 11 at the figure of $1,836,547.54 which has been, in turn, carried forward to page 957, line 5.

Similarly with the item of miscellaneous construction expenditures and omissions. I have recalculated that item on page 961 of Exhibit 39-A and have arrived on line 13 at the corrected figure of $1,118,287.73, which has been carried forward to line 6, page 957 of Exhibit 39-A.

On this last-named page the corrected amount for undistributed construction expenditures in total as shown on line 7 is $7,647,897.58. This figure compares with a previous figure of $7,781,764.69.

The corrected figure has been carried forward and used on page 2 of Exhibit No. 39-A at line 30.

Page 2 is a summary of the estimate and with the corrections which I have outlined I arrive at a total reproduc-[fol. 595] tion cost new of plant property and business at line 36 of $83,833,448.54 which compares with the previous total as shown on page 2, line 36 of Exhibit 39 of $85,262,-766.09.

Q. Have you carried that forward, also, to your original letter of transmittal?

A. Yes, sir, which is page 1 in Exhibit 39-A.

Q. In other words, the total appearing in the last paragraph of your letter on page 1 is the corrected total which you have read from your summary sheet, page 2, headed "Reproduction Cost New" is that correct?

A. That is correct.

* * * * * * * * *

Trial Examiner: Exhibit 39-A is now offered in evidence. The ruling will be deferred until after cross-examination.

By Mr. Wheat:

Q. Now, Mr. Biddison, is there anything further you would like to say in explanation of any of the items contained in Exhibit 39-A?

[fol. 596] A. I would like to explain a price feature in connection with compressor stations. In estimating the reproduction cost on compressor stations in Exhibit No. 39, I used the purchase price of the last main units which had been purchased by Panhandle Eastern Pipe Line Company.

At the time of compilation of Exhibit 39 Panhandle Eastern Pipe Line Company was negotiating for the purchase of additional compressor units and have since that date placed a firm order with the Cooper-Bessemer Corporation.

On March 19, 1941 Panhandle Eastern Pipe Line Company purchased from Worthington Pump & Machinery Corporation one 1300-horsepower unit at a price of $54,384.80.

* * * * * * * * *

The Witness: The unit to which I refer is of the type shown on page 775, for example, of Exhibit 39, lines 2 to

8, inclusive, and also of the type, for example, shown on page 799, lines 2 to 8, inclusive.

On September 25 the Cooper-Bessemer Corporation quoted for engines of this style $63,410 each. This is an increase in price on those engines of about $6.75 per horse-
[fol. 597] power, 1300 horsepower units.

. . . . . .

On this system there are 42 such units of 1300 horsepower each, amounting to 54,600 horsepower. There is also on the system 23 units of 1000 horsepower each, amounting to 23,000 horsepower. These 1000 horsepower units are generally of the same type, but simply a little smaller in size, so there would be affected by such a price increase about 77,600 horsepower at $6.75 per horsepower or $523,800.

Q. Do you understand that this price quoted by the Cooper-Bessemer Company is a firm price for such units?

A. It is a firm price at which two units will be bought.

Q. By this company?

A. Yes, sir, and it is the price at which other units have been sold since June 1 of this year.

Q. By the Cooper-Bessemer Company? A. Yes, sir.

. . . . . .

[fol. 598] Q. Have you anything further to say now with respect to these major compressor units?

A. Yes. In this system there are two 600 horsepower vertical compressor units and six 650 horsepower vertical units. That is 5,100 horsepower. Six of these units were bought in 1940 at $26,897 each. There has been purchased on a proposal dated October 2, 1941 two additional 650 horsepower units at a price of $32,956 each.

Q. Those were purchased by this company, were they?

A. Yes, sir. This is an increase of about $9.34 per horsepower which applied to a 5,100 horsepower would amount to $48,634.

. . . . . .

In September 1941 the Cooper-Bessemer Corporation quoted $13,932 f. o. b. factory for 200 horsepower vertical [fol. 599] gas engine, directly connected to a 125 K. W. gen-

erator. That may be compared to a purchase price in January of '37 of $10,610 for such units.

. . . . . .

Now, I have not had an opportunity to run through the effect of this last purchase order upon the auxiliary engines, but inspection indicates that there would be some substantial additions by giving effect in all the compressor stations to this last price for the auxiliary units.

Q. Well, how much per horsepower is this price now over 1937?

A. Well, it is $16.61 a horsepower increase, but I have not had an opportunity to run the matter through for complete comparison with the prices used in the valuation on the auxiliary units.

Q. Well, is that because you have not had time owing to the pressure of other work in connection with this case?

A. That is right.

. . . . . .

Q. Now, Mr. Biddison, have you anything further that you would like to say with respect to these particular mat-
[fol. 600] ters which you have just been discussing?

A. Only that while I have called attention to these increases in present day costs of main compressor units, I have not given them any effect in the corrections which I have made in Exhibit 39-A.

I want to call attention, further, to the fact that they, themselves, point to what is pretty well known, that we are in an era of advancing prices and prices on all equipment seem to be headed toward increments such as I have pointed out with regard to these compressor units or more.

In connection with the contract with the Cooper-Bessemer Corporation for the two 1300 horsepower units there is a provision in that contract by which the price may be increased over the quoted price, any such increases being based upon specified indices of labor rates and material rates.

There is specific provision in the contract for increasing the price. Nobody knows what the price might be when the engines are actually delivered.

Q. Well there is no provision for decreasing the price, is there? A No, there is none.

Q. The provision only goes toward increases, is that correct?

[fol. 601] A. That is correct.

* * * * * * * *

[fol. 622] O. W. MORTON, having been previously sworn, resumed the stand and testified further as follows:

* * * * * * * *

[fol. 623] Q. In carrying on your duties as an employee of the Panhandle Eastern Pipe Line Company, have you had occasion from time to time to estimate the market requirements in m.c.f. of that company?

A. I have.

Q. Over what period of time have you made those estimates?

[fol. 624] A. Ten years.

Q. Is that done as a matter of curiosity or is there a particular necessity for it?

A. That is one of my annual assignments.

Q. Why is it necessary for those estimates to be made?

A. The company requires those estimates in order that they can have some idea of the gross revenue they will receive during the ensuing year.

Q. They need to know both the revenue they will receive and the amount of gas they will probably sell?

A. Exactly.

Q. In order to have their proper facilities available and make all necessary arrangements?

A. Yes, sir.

Q. In making these estimates you estimate the total consumption, I assume, that is, the total market in m.c.f. Do you also make any estimates as to the maximum day requirements?

A. We also estimate maximum day requirements.

Q. Why is it necessary to estimate the maximum day requirements?

A. Those estimates are necessary in order that the company may plan its construction program.

Q. Have you recently made an estimate of the require-
[fol. 625] ments of the company over the period of 1941 to 1946? A. I have.

Q. Are the results of that study incorporated in Exhibit 40 which has been marked for identification?

A. They are.

Q. I notice that in the exhibit you apparently divide your estimates into two general divisions, west of Dana and east of Dana. Will you point out on Exhibit 15, which is on the wall, the point where that division is made?

A. Dana is located very near, almost exactly upon the Indiana-Illinois state line at the point I indicate here.

Q. Does Panhandle Eastern, itself, transport any gas beyond Dana in an easterly direction?

A. It does not.

Q. What does it do with the gas at Dana?

A. It sells the gas at Dana to the Michigan Gas Transmission Corporation for resale by that corporation or it delivers to Michigan Gas Transmission Corporation gas for delivery by that corporation on account of Panhandle Eastern.

Q. All points west of Dana are those from which Panhandle Eastern delivers its own gas?

A. That is correct.

Q. Without the use of some intermediate transporting company?

[fol. 626] A. That is correct.

Q. Is that the reason why you use Dana as the dividing point?

A. It is a natural division point in all of our statistics and all of our work.

Q. Yes. I notice that you have divided the areas East of Dana into several divisions. You have a Michigan division and an Indiana and Ohio division and a Kentucky Natural Gas Company. The Michigan gas is further subdivided into "Detroit," "Other Industrial" and "Domestic, Commercial and Other."

By the "Detroit" gas you refer, I assume, only to the gas which is delivered at Detroit?

A. That is correct.

Q. By the use of the transportation facilities of the transmission company? A. Correct.

Q. What do you refer to as "Other Industrial" shown on lines 5 and 6 of Exhibit 40?

A. Why, that is industrial sales that we expect to make. You will see that there is none being made in 1941.

Q. That was what I was going to ask next. There is none for '41. You expect to pick that up in '42. Is that correct? A. That is correct.

[fol. 627] Q. And where do you expect those sales to be made?

A. As it states here, in Michigan.

Q. Then line 8—

Mr. Lee: Is the Detroit area, possibly, in what we refer to as the Consumers' Power Area?

By Mr. Culton:

Q. Can you name some of the cities or towns that you have on that?

A. The first that comes to my mind is Pontiac and Flint. There are numerous others.

Q. Does Panhandle Eastern have any industrial sales of its own in Detroit direct?

A. Panhandle makes no direct sales.

. . . . . .

Mr. Lee: Well all of this, lines 5 and 6 and 8 and 9, are sales that you contemplate making under the Consumers Power Company contract, isn't it?

The Witness: Not exclusively. We have just used a general term there "other" meaning sales other than those to Detroit in the State of Michigan.

By Mr. Culton:

Q. You do have on line 8 some sales being made during 1941. What area did you have in mind for those sales?

[fol. 628] A. Well, that comes under the general heading of "Michigan Other" and is the domestic and commercial sales which are now being made in the State of Michigan other than to Detroit. Specifically I refer to Monroe.

Q. There are some parts in Michigan which the company is already furnishing gas to or in addition to Detroit?

A. That is correct.

Q. The Indiana and Ohio load seems to be divided into two divisions, the "Industrial" and "Other," the "Industrial" being 10,000,000 m. c. f.

A. Correct.

Q. What areas are those?

A. That is, as it states, Indiana and Ohio principally, almost entirely located in the Muncie area.

Q. Then, you have "Other" listed there under line 13. What area do you refer to there?

A. That is domestic and commercial sales and unaccounted for and company used gas in the states of Indiana and Ohio.

Q. In other words, the company uses some gas in its operations?

A. The gas which Michigan Gas Transmission Corporation uses is to Panhandle Eastern a sale.

Q. I see, so that it is the company use gas of the Transmission Company that you refer to there?

A. That is right.

[fol. 629] Q. The gas is sold to the Transmission Company and by it is used in transporting the gas which is actually sold? A. Yes.

Q. Line 15, you have an allowance for Kentucky Natural Gas Company. What area is that?

A. Kentucky Natural Gas Company has a gas pipeline coming up from the South, intersecting the Michigan Gas Transmission Corporation's line east of Dana and that is the sale to which the title "Kentucky Natural Gas" refers.

Q. I notice that in your estimates for 1942 and 1943 you are assuming a probability of slightly less gas being disposed of through that method than during 1941 or subsequent years. What is the reason for that circumstance?

Trial Examiner: You mean the reference, Mr. Culton, on line 15?

Mr. Culton: Yes, sir, 1942 has 1,720,000; 1943, 1,690,000.

. . . . . .

A. Well, that is based upon our past performance with this sale, also due to the fact that recently a new contract [fol. 630] has been entered into with Kentucky Natural and the requirements of that contract are for less gas during '42 and '41 and with respect to '43 and '42, the esti-

mator felt that '43 would be less than '42, because during the year '42 Kentucky Natural would be making up a shortage in their takes which now exists. By the year '43, during which the shortages would have been made up, the sale for '43 would be that which is called for by the new contract.'

Q. In the area west of Dana, you have two general divisions, the "Industrial" and the "Domestic and Commercial." Are there few or many towns and communities served in that area?

A. There are many, I would say.

Q. In making this investigation, did you take into consideration the past history in those various areas?

A. The past history is our chief guide in preparing all these estimates.

Q. I notice that as to each of these different types and areas of consumption you show maximum day's obligations. That, I take it, is intended to present your view of the maximum requirements any one day in the year in any of those different areas.

A. The maximum day shown under each classification is the contribution of the respective classes to the system total maximum day rather than the individual maximum [fol. 631] day of each class.

Q. Is it true that the maximum day for any particular area would necessarily be the maximum day for the entire line? What I mean to say, stating it differently, would the maximum day for the entire line always be the maximum day for an individual area?

A. We have the proposition of diversity there. The thing you have in mind, no doubt, is whether or not the total maximum day to be taken care of on our line is equal to the sum of all individual maxima of all the different points of delivery.

And the answer is no.

Q. How do you arrive at the maximum day for the line then?

A. We use past performance and experience, we consult the individual maximum days of the different points of delivery, we study previous years' maximum days and then we arrive at what, in our best judgment, is the contribution of each individual delivery to the maximum day

and then we add all of those and that gives us the maximum day for which we will have to construct capacity.

* * * * * * *

[fol. 632] Q. I ask you to examine Exhibit 41. Was that graph prepared by you or under your direction? A. It was.

Q. Will you explain it to the Examiner and for the purposes of the record?

A. On Exhibit 41 I have plotted cost of gas plant against total annual sales of the Panhandle Eastern Pipe Line Company and subsidiary companies' system. The scale applying to gas plant reads in millions of dollars and the scale applying to annual sale reads in billions of cubic feet.

Q. What did you use as the gas plant, for the number of millions of dollars?

A. We used what is called for in our classification of accounts, "Gas Plant Classified" at the End of Each Calendar Year.

Q. All right, proceed.

Mr. Gorman: That is taken from the books, of course.

[fol. 633] The Witness: It is.

The bottom curve or graph is "Annual Sales" and is self-explanatory, I believe.

By Mr. Culton:

Q. The graph, in short, shows an increasing amount of sales annually and, during the same period of time, increases in the gas plant account. A. It does.

Q. I note two lines, one marked 1940 and one marked 1941. Those two periods are marked "Est." What do you mean by that?

A. It means that I have estimated those values.

Q. And that purports to show the year 1941 which is not yet completed? A. It does.

Q. Were any portions of the figures used for that period actual figures?

A. We had six months actual to guide us in making the estimate.

* * * * * * *

Mr. Gorman: Do I understand from your statement that only the last six months or the last year of which you

[fol. 634] have been speaking was estimated and the first six months of 1941 are actual figures?

The Witness: I believe you mean, does the point half way over from 40 to 41 represent the actuals?

Mr. Gorman: That is right.

The Witness: It does not.

* * * * * * * *

The Witness: (Interposing) The whole year is estimated and I had, in preparing the estimate, the advantage of six months actual.

* * * * * * * *

The Witness: I might say that I feel quite certain, although I haven't tried to spot it on here since I drew it, that that midpoint is just about the six months actual.

Mr. Gorman: So the answer is really that despite the fact that you had the first six months' figures available you still estimated for that period.

The Witness: That is true.

Mr. Goodman: May I ask a question here? Is there any significance in the slope of the curve? In other words, does that indicate that the sales increased in the ten [fol. 635] periods marked out there at that rate or is it to be read as from point to point?

The Witness: You read this from point to point, that is to say, if you will look at it there, 1933 the figure is 11 plus. In 1934, the annual sales were 13 plus.

Mr. Goodman: I see. So that really to be really accurate the line is not significant, it is just the points on the line that are significant.

The Witness: Yes.

By Mr. Culton:

Q. That isn't divided into 12 units to show 12 months, it is merely the paper it is prepared on? A. Correct.

Q. Returning back to Exhibit 40, do the estimates shown on that exhibit evidence your best judgment as to the requirements of Panhandle Eastern during the years

shown on that exhibit for those different areas and for the line as a whole and the maximum day requirement during those same periods? A. It does.

* * * * * * * * *

Trial Examiner: The proposed exhibits, identified as 40 and 41, have now been offered and the ruling on admission will be deferred.

* * * * * * * *

[fol. 639] Mr. Gorman: Did I understand your testimony to be that the construction program for the following year of Panhandle Eastern is based upon your estimate of volumetric demand for that period?

The Witness: The construction programs of past years have been based upon my estimate of maximum day and sales similar to this estimate I have prepared here. As to the future, and that was your question, I can't answer it.

* * * * * * * * *

[fol. 647] Mr. Lee: Is this maximum day that you have set forth in your exhibit what you anticipate to be the maximum day under the Detroit contract, or the maximum [fol. 648] day for the entire system west of Dana?

The Witness: I don't understand your question.

Mr. Lee: In Exhibit No. 40, you have 1941, M. C. F., 24,000,000, line C.

Then, you have maximum day, 102,604. Now, how do you arrive at that maximum day? Is that a maximum day for the entire system, the average west of Dana, or is it the maximum day for the Detroit area which will affect the contract for the Detroit area?

The Witness: I previously testified, Mr. Lee, that the individual max days shown here are the contribution of the individual loads to the system max day upon the system's max day.

Mr. Lee: How do you apportion to the Detroit area alone?

The Witness: It happens that the 102,604 is an actual figure. That was the contribution of Detroit to the total of 240,394 on the system's maximum day.

Mr. Lee: Has that figure any reference to the maximum day referred to in the Detroit contract which fixes the demand charge?

The Witness: It has none.

* * * * * * * *

Mr. Lee: Your estimates for the next five years so far as the Detroit area is concerned show a continuing increase [fol. 649] in the volume of gas you expect to sell there; isn't that right?

The Witness: Yes, sir.

Mr. Lee: Did you have any correspondence with the Michigan Consolidated Gas Company and the distribution company, that you used in making up that estimate?

The Witness: I do not.

Mr. Lee: Did anybody for the Panhandle have it and give it to you?

The Witness: They did not.

Mr. Lee: Have you ever had any factor in making up your estimates for Detroit area, did you ever have any factor in your mind for the diminution in the use of gas for automobile companies there; by automobile companies there by reason of any defense program that might reduce the amount of gas sold—had that ever occurred to you?

The Witness: That never occurred to me.

Mr. Lee: And, of course, you used nothing like that in this estimate?

The Witness: I didn't use that. I wouldn't say anything like that, but I didn't use that in this estimate.

* * * * * * * *

[fol. 652] Mr. Chamberlain: Mr. Morton, in order that the record may be perfectly clear, will you let us know whether the maximum day that you have indicated on Exhibit 40 is the day of the highest send-out for any day of the year, or does it refer to the highest send-out during the four winter months?

* * * * * * * *

Mr. Chamberlain: I am referring to the term "Maximum Day."

* * * * * * * * *

Mr. Chamberlain: In other words, what is your defini-[fol. 653] tion of "maximum day" as respects this exhibit?

The Witness: "Maximum day" as shown on line 27 is the total maximum day which I estimate will be experienced on The Panhandle Eastern Pipeline System on the day of the highest demand for the 12 months' period.

Mr. Chamberlain: Yes, and is your estimate not made with respect of the higher demand of the four winter months?

The Witness: It happens that our highest demand does occur during the four months' period, and this estimate contemplates that the highest maximum demand will occur during the winter time.

Mr. Chamberlain: Do you remember the date of the maximum demand in the current year?

The Witness: It was February 19.

Mr. Chamberlain: And your computation with respect to the Detroit maximum day was with reference to the maximum day upon the system rather than the maximum day at Detroit?

The Witness: Yes, the 102,604 shown here is Detroit's contribution to the Panhandle Eastern maximum day; not Detroit's maximum day.

* * * * * * * * *

C. H. Hinton called as a witness for the Panhandle [fol. 654] Eastern Pipeline Company, having been first duly sworn, was examined and testified as follows:

* * * * * * * * *

Q. You live in Kansas City? A. That is right.

Q. Have you caused to be prepared written testimony in this case? A. Yes, sir.

Q. Also, some schedules presented in connection with it? A. That is right.

Q. And three separate maps? A. Two development maps and one area map.

Mr. Culton: Mr. Examiner, at this time, may the record show that we are requesting that a document entitled "Written Testimony of Witness C. H. Hinton" be marked for identification as Exhibit No. 42.

That a document entitled "Schedules Presented in Connection with the testimony of C. H. Hinton" be marked Exhibit 43 for identification.

That a map entitled "Development Map Basic Load" [fol. 655] be marked Exhibit 44 for identification.

That a map entitled "Development Map Anticipated Increased Loads" be marked Exhibit 45 for identification.

That a map entitled "Group Area Map" be marked Exhibit No. 46 for identification.

Trial Examiner: These exhibits may be so marked for identification.

• • • • • • • •

Q. Are the facts set out in your written testimony true and correct to your best judgment? A. In my best judgment, yes, sir.

Q. Are the exhibits and maps presented in connection with your testimony correctly prepared in your judgment? A. Yes, sir.

• • • • • • • • •

[fol. 671] Trial Examiner: Do you wish us to understand, Mr. Hinton, the substance of your written testimony is under oath, and in effect is such as you would give in response to certain questions and answers?

The Witness: Yes, sir.

Trial Examiner: So far as statements of facts are made, you believe the statements are true, and insofar as opinion is concerned, they represent your best judgment?

The Witness: Certainly.

By Mr. Culton:

Q. Mr. Hinton, without going into the general testimony given in the earlier portion of your written statement but addressing myself to the testimony commencing on page 21 of Exhibit 42, I desire to ask you with respect to a number of those items to give the reason for them and point out on the map just exactly where the work is to be done.

I notice that you make no distinction between the basic [fol. 672] load and the anticipated load for the year 1941 and the anticipated loads for that year is on page 26.

That is just because the year is just about over and you have a pretty good idea as to what will be done; is that correct?

A. That is correct. The change in the load would not change the expenditure.

Q. Yes. So that counsel may understand you have prepared two maps which show the amount of work which would be done, first under the basic load, and second under the anticipated load.

. . . . . .

[fol. 673] Trial Examiner: In order that we may have no confusion, let us try and refer to the basic load map as the map marked for identification as Exhibit 44, and the other as Exhibit 45.

. . . . . .

Q. Did you use the same color scheme in the preparation of those two maps?

A. Yes, sir.

Q. Would you please explain to the Examiner, and for the purpose of the record, just exactly what your color scheme used means and if you need to go to one of the maps to point out, you may do so.

. . . . . .

A. (Going to the map) On the schedule there, it shows that there is to be some work done through 1941. Now, all that can be shown on a map by symbols is shown in a grey color.

That takes in the installation of two well compressors.

. . . . . .

(Interposing) The grey shows the work to be done in 1941.

[fol. 674] The brown, 1942.

The green, 1943.

The orange color, 1944.

The purple, 1945.

The blue, 1946.

Trial Examiner: Is that true of both maps, Exhibit 44 and 45 as well?

The Witness: Yes.

Mr. Littman: May I inquire are those the legends marked on the maps themselves?

The Witness: Yes, sir, down in the right-hand corner.

Mr. Culton: The lower right-hand corner.

Explain what the red is on those maps, and the yellow.

A. The leases shown in the dark red are leases that were drilled previous to June, 1941, and the yellow acreage is acreage which is under gas purchase contract.

The lighter pink acreage is acreage which is under lease to the Panhandle Eastern and which will be drilled at a later date, that is, after the five-year period which this map covers.

Q. You do not contemplate drilling those particular leases during the five-year period at this time?

A. No, sir.

Q. Under either the basic load or the anticipated load?

[fol. 675] A. Only those that are shown by the color that is in the lower right hand corner of each map.

* * * * * * * * *

[fol. 676] Q. The first item on 1941 is construction installing a specially designed liquid separator between Sneed and Hansford Station in Texas, costing $26,300. Has any work been done on that?

A. It is under construction and I believe that it is pretty well dug out now. I think they have had just a

little delay on getting the separator tanks, and I don't know just exactly what stage that is in right now, but I know that it is under way.

Q. In the process, will you point out about where that will be on the map?

A. I don't show on the map that because I didn't have any symbol, but it would be right in this area right in here (pointing).

[fol. 677] Q. What is the purpose of that separator?

A. That is to try to get away from the icing conditions in that line that has prevailed over the past several winter's operations.

Q. Explain what you mean by the icing conditions.

A. Well, when the gas leaves the compressor station at Sneed, shown on the map there, it is heated and as it goes on down the line, that gas cools and hydrates are formed in that line and have caused us considerable trouble, and the flow efficiency has gone down so low in the past year's operation that we are putting this one in addition to further work on the dehydration station, the plant there, to try to get better flow efficiency in the line.

It is really a super drip, you might call it. In other words, it is designed to try to take the moisture from the pipe line.

Q. In other words, it is what might be termed an advancement in the art of operating pipe lines?

A. That is right.

Q. You are attempting to get away from certain conditions that now work against economic operation.

A. Yes, sir.

Q. The next item which you have is two individual well [fol. 678] compressors in the Burnett field, Burnett well No. 108, and Bivins well No. 91.

Q. What is the necessity for those two field compressor stations, or well compressor stations?

A. That is due to the formation pressure. In those wells, the Burnett well pressure is down to a point where it is impossible for it to produce any gas into our pipe

lines against our required operating pressure, and the Bivins well is not quite as bad.

There have been a few days this year that we could get our pressures down low enough to take a slight amount of gas from that well, but we cannot depend upon it for any peak load delivery, and that is the reason we are installing that compressor there.

. . . . . .

[fol. 684] Q. Mr. Hinton, when we adjourned yesterday, we were discussing two individual well compressors for two wells on the Burnett and Bivins leases in the Panhandle field. You stated that it was necessaary to install these well compressors at these wells in order to boost the pressure up to where they would enter the pipe line at the present working pressure, I believe.

A. That is right.

Q. What stage is that construction in at this time on those two wells?

A. The compressors are in the warehouse at Fitch, Texas, and we are waiting on some of the smaller parts to start the actual installation of the two units.

Q. All of the equipment is either now on hand, or on order?

A. Yes. And, it is all there except just a few minor parts.

Q. Are any of the gas purchase contract holders in [fol. 685] that field from which Panhandle Eastern is purchasing gas at this time using compression to enable their production to enter the pipeline?

A. Yes, the Huber Petroleum Company has 19 wells which they produce through one main station.

There is one of those 19 wells, the Chapman well, which will produce during the lower periods of working pressure on the line, and it doesn't go through the compressor all the time, but the other 18 are on all the time.

They have another group of three wells which are on a compressor all the time; in addition to the Huber Company, the King Oil Company has—they have two wells

which are produced by means of compressors to get the gas into our lines.

Q. What is your judgment as to the necessity of further use of field compressor stations or well compressor stations in the latter years of that field?

A. Why, I think there will be many field compressors in the next few years.

Q. The next item which you have for 1941 on both the anticipated load and the normal load or the present load about which you have testified, is to construct a warehouse at Zofness Camp.

Just what is Zofness Camp? Can you point it out on exhibit No. 45?

* * * * * * * * *

[fol. 686] (Going to the map) That is in section 55 and that camp is located right up here (indicating), as I remember. It is northeast of the northeast of the northwest.

Q. Section 55; what block is that?

A. 6-T, T&NO.

Q. When was the Zofness Camp constructed?

A. 1930, the first building was done there, and in 1931 we wanted to fence it and I surveyed that camp at that time. It was in August of 1931 that we definitely tied the camp location in.

Q. Why is there a necessity for a warehouse at Zofness Camp at this time?

A. Well, in the years before this, why, we did our warehousing out of Fitch, Texas, but about three or four years ago—maybe a little longer than that—the railroad bridge which we used to cross from the Fitch Warehouse—

Q. (Interposing) That is across what? The Examiner may not know.

A. The Canadian River washed out, and that made it necessary to make a trip of about 44 miles to get from the Fitch Warehouse out to the Zofness Camp, so this year we built a small warehouse there so we could carry the necessary stock of supplies over there without making that [fol. 687] long haul from the Fitch Warehouse.

* * * * * * * * *

[fol. 688] Q. The expenditures, $500.00, I believe that is the amount for that warehouse this year. Has this already been completed?

. . . . . .

[fol. 689] A. That was completed on, some six weeks ago, I believe.

Q. You have included in your figures here, all of the capital construction completed after the first of July, 1941?

A. I think it has been so noted on here.

Q. Yes. I just wanted to make that clear, that even though it has already been completed but, if it is completed since June 30, 1941, you are showing that here?

A. Yes.

Q. The next item you have on both types of load is to drill a well near Guymon, Oklahoma, in the Hugaton field. Have you already selected the point at which that first well will be drilled?

A. Yes, sir.

. . . . . .

That well will be located approximately in the center of the west half of section 25, township 3, range 15. It is noted on the map as Central Life. The names of all the landowners are noted on these exhibits 44 and 45 where we expect to drill wells during the next 5 and 1/2 years.

Q. In other words, by finding that point on the map and referring to Mr. Wallace's exhibit giving the names of the landowners, you can check the lease.

A. That is right. We have to do that to figure our [fol. 690] rentals, also.

Q. Yes.

Mr. Hinton, is there any particular necessity for starting construction in the Guymon, Oklahoma area:

A. Yes.

. . . . . .

It is not so much the matter of having to have the gas this winter that leads us to start the drilling of this well. It is due to the fact that that lease expires next year before June, I believe, next year, and we feel that we

should get this under way because that particular lease has been top leased by another company, and the only way we can hold that lease as a part of our reserve is to drill it before the expiration date.

Q. The Examiner, I am sure knows, but someone reading the record might not know what you meant by "top leasing".

A. I mean that another company has taken a lease on this particular land that becomes effective at the time of our expiration.

Q. And your lease provides that it is to be in force for a certain period of time and so long thereafter as production is had.

A. That is right.

Q. And if you get production prior to that time, your lease will continue and their lease will not become ef- [fol. 691] fective. I did a bit of leading there but I believe you can understand why.

Mr. Littman: I was going to ask the witness to state what company has top leases.

The Witness: Hagy, Harrington & Marsh.

Mr. Littman: What date is it expected that the well will be drilled near Guymon, Oklahoma?

The Witness: We expect to commence the drilling of that well probably in the next three or four weeks.

Mr. Littman: But how long will it take you to complete that well?

The Witness: It should be done four to six weeks after the date we start commencing to drill.

By Mr. Culton:

Q. The next item you have is to purchase an automobile for the use of the field forces in the Hugoton field. What is the necessity for that expenditure?

A. Well, we are going to have a heavier load out of the Hugoton field this winter than we ever had before, and last winter we were just operating about down to the last peg during our heavy pull, and we are going to have to put on this additional automobile to take care of the manipulation of the load because the Texas line will be operating

at full capacity and the manipulation of the load, or the taking care of the rise in fluctuations of the daily deliveries will be taken care of out of the Hugoton field.

. . . . . .

[fol. 692] Q. The next item is to construct the Cimmaron River jetties to protect present river crossings from high water. Will you show the Examiner just where that Cimmaron River crossing is, referring to exhibit 45?

A. It is directly south of the Liberal, Kansas com-[fol. 693] pressor station site. It is located in section 24, township 33, range 32.

Q. Has that construction been under consideration for some time by the company?

A. Since the last two or three high waters, yes.

Q. In other words, the last two or three high waters, on the Cimmaron River has caused you to become a little bit concerned about the crossing staying in without further protection?

A. There is considerable evidence of washing there now.

Q. Yes. These jetties, just what are they? How are they made?

A. Well, they will probably be a pipe or piles driven as deep as they can get them into the ground there. They will probably pour concrete around the base.

. . . . . .

And then they will probably string wire along there and make it just as stable as is possible to divert washing at the points desired.

. . . . . .

[fol. 694] I believe that the necessary right-of-way has been purchased there to enable the company to go ahead with the construction on the banks, but I haven't been down there for the past five or six weeks.

. . . . . .

Mr. Littman: May I inquire whose estimate is this $6,500.00, the estimate to construct the river jetties?

The Witness: That comes from the engineering department. They prepare all estimates of that type.

Mr. Littman: Then I take it it is not your own estimate?

The Witness: No, sir.

* * * * * * * *

Q. Now, in 1942 we find some substantial differences between the required expenditures on the basic load and the required expenditures on the anticipated load; the aggregate expenditures under basic load being $2,756,000, while the aggregate expenditures on the anticipated load are approximately $4,500,000. For that reason, we will discuss the differences between those requirements as we go along.

* * * * * * * *

[fol. 695] Trial Examiner: Would it not be well to indicate just the source of the figures which are included in your proposed exhibit 42 at this time?

Mr. Culton: Yes. What is the source of the figures which you used in your computations for all these expenditures?

The Witness: Well, I believe that—I tried at least to cover in this testimony an explanation that the prices used were either those of Mr. Biddison, or those which we had estimates on, or quotations on that were applicable to work that we were going to do in the near future.

By Mr. Culton:

Q. Now, with respect to the wells, we are going to get into the expense of drilling wells. What figures did you use on that?

A. We figured the unit price as worked out by Mr. Biddison which was an average of several—many contracts, and we used for the pipe, the present price, present quoted price and for liner, or tubing, we used the same, and for the cost of installing liners, and installing tubing, we worked that out—we had no prices on tubing so we [fol. 696] broke that down as best we could in our own department, and got our figure for the tubing. On liners, it was based on past experience. On acid treatment, also on past experience.

* * * * * * * *

[fol. 697] Q. During 1942 under both estimates, you have drilled five wells in the Panhandle field, including acidation and liner. You would be in a position to advise the engineers for the Commission, or any other party just exactly the location of those wells that you are talking about there?

A. I think they are all rather clearly shown on the map there. It is all of the leases shown in brown color on either exhibit 44 or 45.

* * * * * * * *

Q. All of those wells are in Moore County, is that correct?

[fol. 698] A. Yes.

Q. Now, in your report, you say including acidation and liner. What do you mean by "acidation"?

A. By acidation we mean the acid treatment of wells which consists of a treatment of hydrochloric acid; usually, the total treatment will run 10,000 gallons. That is what we are using now and this treatment is usually put in in the form of a light shot as we call each injection, about 500 gallons of acid, to 500 gallons of water, and this is pumped down with a compressor back into the formation just a little bit so that it has a chance to clean the side wall of the well bore.

Then the well is opened, and it is allowed to blow out, and this wash treatment is usually repeated until we get a fairly clear return.

Q. What do you mean by "clear return"?

A. I mean that the liquid coming from the well is not carrying any great quantities of larger pieces of lime and it is not cloudy with lime dust.

Q. What does the acid do to the formation?

A. Well, I believe the best term that comes to me, it disintegrates it. It just eats away the lime and creates larger pore space and connects the pore space to a greater extent allowing a much larger flow of gas to the particular area on which the acid works lying near the well bore.

[fol. 699] Q. Does it create any more gas down in the reservoir?

A. No, sir. But it does increase the deliverability of a well and, in many cases, a great deal.

Q. In other words, it increases the ability of the well to deliver volumes of gas over a certain period of time?

A. Yes, sir. And greater volumes at the same working pressure.

Trial Examiner: Just as a matter of general information, may I ask at this point, from what percentage, roughly, of the wells on which you rely is oil also produced?

The Witness: They still produce oil from some of those Huber wells on the Continental lease and we have one that is trying awfully hard to make an oil well out of itself.

By Mr. Culton:

Q. Except for those three, none of the wells produce oil at all? A. That is right.

[fol. 702] Q. Now, you have explained the acidation. What are the liners?

A. The liners are pipes which will fit inside the produc-[fol. 703] tion string which are perforated usually with slots about 1 inch by 12 to 16 inches, that are placed through the actual pay.

Q. By "pay" you mean the producing portion of the formation?

A. The producing formation, and these slots enable the gas to come into the well bore; but at the same time, keep the wells from caving, that is, where there is a shale break, or loose material, oftentimes the wells have a tendency to continuously cave, and fill up the well bore with these rocks, shale pieces, and it is necessary to blow those wells very often, and these liners are installed to keep the well bore free from cavings that is the primary purpose of them.

Q. So those reading the record might not understand what you mean by "blowing the well"—

A. By blowing a well, I mean that the well is opened to the full size of the production string to atmosphere and allowed to blow.

Q. In others words, the gas goes off into the air?

A. Yes, sir.

Nothing is holding back but atmosphere.

Q. That is right, and as it goes out it carries these cavings out with it?

A. That is true. As long as the pressures are up as [fol. 704] high as they are now, it is rather easy to keep a well bore clean, but as these pressures—

Q. That is, by this blowing process?

A. By this blowing, but as the pressures go down, why, it is not going to be possible for those wells to carry out the same amount of cavings and therefore, these liners, we feel will be of great advantage and we are installing them somewhat earlier than might be termed necessary, because we are looking to the curtailment of any gas waste that is incurred in blowing wells to just clean them.

Q. In other words, when you blow a well, you just lose the amount of gas that goes into the atmosphere in connection with the blowing; is that correct?

A. To a certain extent, you do, Mr. Culton.

Q. That is, there is no utilization of it except for cleaning purposes?

A. Not at that particular time but by blowing a well, you clean out the permeability back from the well bore, and I think that enables a better migration of gas, but it really wouldn't be felt for several years.

Q. I see. Now, are you at this time, acidizing and putting in liners in connection with all of your new wells, as you drill them? A. Yes, sir.

Q. And you provide in subsequent portions of your [fol. 705] statement here expenditures for installing liners and tubes and acidizing old wells as the years go by?

A. That is right.

Q. What is the ordinary cost of acidizing the wells in the Panhandle? Is it exactly the same in all wells?

. . . . . .

A. About $1,550.00.

Q. What is the ordinary cost of installing a liner?

. . . . . .

A. That varies with each well.

Q. Due to the depth of the well?

A. Due to the length of open hole.

. . . . . .

That is, from the bottom of the producing string down to the total depth of the well.

* * * * * * * * *

Q. Could you give us roughly what the approximate amount will be for them?

[fol. 706] A. I would say from $400 to $700; that would be about as approximate as I would want to go.

* * * * * * * * *

Q. In item "b" for the year 1942, in both classifications, you provide for installing liners in two old wells in the Panhandle field. Have you found already that those liners are needed.

A. Yes, sir. If we didn't feel that they would be of advantage, we wouldn't have them on our next year's budget.

* * * * * * * * *

[fol. 707] Q. What do you mean by "tubing"?

A. I mean by tubing that we install a smaller string of pipe clear down to the bottom of the well to carry off water which is coming into the well bore without trying to raise a full column of water through the producing string.

Q. By the well bore, you mean that part of the producing formation around the bottom of the well, bottom of the hole—

A. The well bore, I mean that is the hole itself to the producing formation.

Q. And the water is coming in down at the bottom of the hole, or somewhere down there?

* * * * * * * * *

A. On this particular well, I don't think it is bottom-hole water. It is caused from a condition down around that well. When this well was first started, the contractor lost the hole, that is, he either got a crooked hole or he stuck the tool—it was before I was down there, and I don't know, and he moved over and the same thing happened again, and this well he finally completed—we bought it from another company—and the water seems to be com-

[fol. 708] ing in from one of those old holes which were improperly plugged.

Q. Do you remember the name of that well?
A. Yes, Sneed No. 23.

* * * * * * * *

Q. After you drill wells, how do you get that gas into your gathering lines? Through well lines or just what do you do?

A. Yes. If, of course, at the completion of the well, we put on what we term a "Christmas tree" and this goes to a well line through the well meter and then on to the gathering line itself.

Q. What do you mean by a "Christmas tree"?

A. Well, that is an oil term that originated probably in some high pressure field where the head of the well looks like it was decorated for Christmas, and it is just a term that has carried on down through the years.

Q. It has the various connections?

A. That is right.

Q. By which you control the amount of production from the well; is that correct?

A. That is correct.

Q. And it also has certain connections by which you can open that well to the atmosphere?

A. That is right.

* * * * * * * *

[fol. 710] Q. Now, you say after your gas comes from the Christmas tree, it goes to the well lines? A. Yes, sir.

Q. Where do the well lines carry it?

A. To the gathering lines.

Q. Now, en route between the well and the gathering lines, is that gas measured?

A. Yes, sir. That passes through an orifice meter.

* * * * * * * *

[fol. 711] Q. In other words, you determine the pressure on the upstream side and the pressure on the downstream side, and the differential? A. That is right.

Q. And then you apply certain well recognized tables in determining how much gas that showed to have passed through the pipe? A. I think that explains it.

Q. This measuring is all done in connection with the meter?

* * * * * * * *

Q. And what else do you have in connection with that meter? Do you have a station of some kind enclosing that [fol. 712] meter? A. Just a regular meter house, yes.

Q. Under item "e," of each of these tables, you show laying well lines for five new wells, amounting to $15,395. Do your papers show just exactly what the distances were on each of those well lines so they can be added together?

A. Yes.

Q. And the appropriate prices applied and you reached this $15,395?

. . . . . .

Q. These five new wells that you are expecting to serve, by those well lines, are the five wells that are referred to in subdivision "a"? A. Yes, sir.

. . . . . .

Q. Item "f", that is to construct five measuring stations. Those are the stations where you house the meters. Does that include the cost of the meter? A. Yes, sir.

Q. And everything else used in connection with that? [fol. 713] A. That is the complete meter and the house for it.

Q. Now, item "g", on the basic load, and item "h", on the anticipated load are to increase the capacity of the gathering lines from Zofness to Sneed by looping the existing line between those points and to construct additional gathering lines.

Will you point out on exhibit 45 the portion of the gathering line which you expect to loop during 1942?

A. This portion of the line is shown in brown (indicating) and we expect to loop down to the junction here (indicating) with 26 inch pipe.

. . . . . .

[fol. 714] Q. And do you recall what that distance is that you have in mind looping?

A. Let's see—I believe that is slightly over 7 miles, down to the junction on section 55, block G-T, T&NO, Moore County, and then from that point on west to the

point where our Nield well takes off. That is in section 25, block 44, H&TC. We are going to put in a loop there of [fol. 715] various sizes, that is—we have now a stretch of 12 inch pipe in there which we are going to loop with 20, and when we go back to our 16 inch again, we are going to finish that with 16. That is shown in detail, however, in my estimate.

Q. Is that additional capacity you think, going to be needed on the basis of the present load in 1942?

A. Yes, sir. I would feel better if we had it for this winter.

Q. You will really need it and you need it now?

A. Yes, sir.

Q. Why will the need become greater in another year if there is no difference in the volume?

A. Well, the pressure on the wells will probably be an average of 11 pounds lower for the next winter's operation than it was for last winter's operation.

Q. What difference does that make in the deliverability in the gathering lines?

A. It is according to the characteristics of the well. On the average, it will mean that there will be a little greater reduction in percent of deliverability than the 11-pound drop as a percent of the average closed-in pressure of the previous year.

Q. So, it becomes a question of consideration of pressure that you carry in your gathering lines as well as the pressures in the wells; is that right? A. That is right.

[fol. 716] The point I was trying to make is that the deliverability falls off at a slightly greater rate than the pressure does.

Q. Do you anticipate having to carry some lower working pressure in your line, gathering line, to take care of that situation? A. We will be forced to.

. . . . . .

Q. Then, if you are forced to carry a lower working pressure in your line to take care of the gas coming into that line, from wells where the pressures are becoming lower and lower, how can you take care of that gas?

A. By only one way, and that is either—I would say additional horsepower, or additional gathering-line capacity.

Q. And this is the character of additional gathering-line capacity that you think will be needed in this particular situation?

A. It could be taken care of in either manner, and we studied both methods of trying to increase our load into Zofness. The design of our pipe-line system is such that it is almost necessary to loop the greatest part of it, even if we went to what we might term a centralized horsepower, and therefore, we decided that probably the looping would be better because we would spend about the same amount [fol. 717] of money, and we would cut down the operating cost at another compressor station which would be located out near the Zofness Camp.

Q. In other words, for that particular operation, after making a study, you reached the conclusion that looping would be the most economical method of handling it?

A. Yes, sir.

Q. Now, in the study based on the anticipated load, you have an item for constructing a trunk gathering line, looping the present line from Hansford Station South, 21.1 miles, costing some $672,000. That item does not appear in a consideration of the basic load requirements.

A. That is right.

Q. Why is it that it would be required in 1942 under the anticipated load and yet not required in 1942 under the basic load?

A. Because we plan to take from the Texas field next year a peak day of around 205 million feet. At the present time it is 165 which means that we are going to increase that load from Texas on peak days by about 40 million cubic feet.

. . . . . .

And that is the reason we have to have additional [fol. 718] pipe-line capacity.

Q. In other words, your judgment is that the present pipe line would not be adequate to enable you to transport that volume of gas from the Panhandle field without some addition?

A. Unless we could go to higher pressures which we are unable to do with this present type of construction we have on that line.

Q. You think that the most economic way to handle it would be by the additional looping to which you have referred?

A. I am quite sure of that.

Q. Now, will you point out to the Examiner on Exhibit 45, the place where you think it would be looped during that 1942, on the assumption that the load will be as anticipated?

A. The looping would start at Hansford Station which is located in Section 13.

Q. Hansford County, Texas?

A. I was going to give that; section 13, block 1, Washington County Railroad Survey, Hansford County, Texas, and that would extend southwest to about the town of Morse, Texas, which is located in section 30, block 5-T, T.&N.O. Railroad Survey, Hansford County, Texas.

Q. What type of line do you expect to construct there, that is, the size of it?

A. That will be a 22 inch line, but it is going to be designed to carry higher pressures than our present line. [fol. 719] That is a 500-pound line we have, and we estimated that we would put in a 700-pound test line so that—you will notice that the looping is carried from the station to the south, instead of from the discharge side of the station north.

Q. Yes, explain that and why.

A. That is in order to take care of these future leases which we have down in Hansford County.

Q. So that a person reading the record, without having seen your indicator, can understand, those are the leases colored pink and shown in Hansford and Sherman Counties, Texas?

A. That is right.

Q. Do you anticipate any drilling of those leases during the 5-year period?

A. We have not put that in our budget, but there is a possibility that we will drill one well down here (indicating), to try to get further information on the formation in that area.

Q. But you do not have it in your budget about which you have been talking? A. That is correct.

Q. What is the comparison between the size of that looping and the size of the existing line running along that same course?

A. They are the same sized lines.

[fol. 720] Q. Item "h" on the basic load, and item "k" on the anticipated load call for the construction of additional dwellings for employees, three at Zofness, three at Hansford and six at Sneed; the one at Hansford being really a ten-room hotel; the aggregate cost of these units being $81,000. What is the necessity for that construction?

A. Well, it is a long way from the camps mentioned into any town, and if the company would not build housing facilities for these employees, it is necessary that they drive back and forth to town. Now, this particular building program has been increased over what we would originally have estimated for this year due to the fact that we have put all of our employees on a straight 40-hour week, that is, we had been working those employees 48 hours and paying 8 hours overtime and then the management just adopted the straight 40 hour week.

That meant we had to hire several more men around the compressor stations and in the pipe-line department, and in the production department, so for that reason, we have had to increase this number of houses to be built.

Q. In other words, it takes care of the new men you are now adding to the pay roll?

A. And it also takes care so that, instead of driving from the towns like they have done in the past, which I understand they have been getting mileage for driving—but they are not going to continue to do that.

[fol. 721] Q. It is considerably more economical to furnish the facilities for them out at the camp?

. . . . . .

[fol. 722] Q. Item I on the anticipated load, being on page 27, is an expenditure of $362,800 for additional horsepower at Sneed station to increase the cooling tower capacity and one additional auxiliary engine and one scrubber. Will you explain the necessity for those items?

A. Well, we have to have the additional horsepower due to declining field pressures which forces a lower work-

ing pressure in the pipeline. The increased cooling tower capacity is badly needed in order to cool the gas down to a temperature low enough to help in the process of dehy- [fol. 723] dration and the auxiliary engine is necessary because we are going to run an additional pump and at the same time these auxiliary engines generate the power for the camp and it is necessary that we install this additional auxiliary engine for these two reasons. The scrubber is required because we are going to increase the capacity or the volume, rather, of the amount of gas going through to the extent that the other scrubber will be required.

Q. Just what do you do with that horsepower capacity at the station? What function does the engine serve?

A. The engine turns the compressor.

Q. And what does the compressor do then?

A. It takes the gas on the suction side of the compressor at a lower pressure and forces it to a higher pressure when it emerges from the discharge side.

Q. In other words, you take the gas into that station at a certain pressure and before you start transporting it north and east you increase the pressure?

A. That is right.

. . . . . .

[fol. 724] Q. The Item 1 for 1300 horsepower at Hansford, why is that going to be needed?

A. In order to handle this additional amount of gas that will pass through the Hansford station.

Q. In other words, you are allowing for more gas that year than the present?

. . . . . .

[fol. 727] Trial Examiner: (Interposing) Mr. Culton, to come back to the direct question, how is this future proposed expenditure and the additions and betterments contemplated in the next five years, how is that related to [fol. 728] the determination of the present rate base and the fairness of present existing rates?

. . . . . .

Mr. Culton: I will be glad to discuss it, Mr. Examiner.

It is related to the rate base for this reason: If this company at this time made these expenditures, unquestionably they would go into the rate base at this time. Several authorities, which we will be glad to obtain and furnish to the Examiner if he desires, have held that such expenditures as may reasonably be expected in the reasonably near future may be taken into consideration.

* * * * * * * *

We assert that in determining the reasonableness of [fol. 729] this price, of this existing rate, the Commission must take into consideration the expenditures which will be made in these future years and must allow a reasonable amortization of those expenditures in determining whether or not the existing rate is too high.

Now, that is with respect to the rate base, itself, and that unquestionably applies, if we are right in our legal position, both to the basic load and to the anticipated load.

Another circumstance which makes this evidence very pertinent is that as these years go by the evidence will show the over-all unit cost of producing gas is increased. It is increased because of the necessary carrying charges on the additional capital expenditures which will be required and increased by the necessary amortization of those capital expenditures and the depreciation of the items and increased by the additional operating expenses which would be necessitated by reason of the increased expenditures.

We offer the evidence, carrying out the holdings of our courts, that the only way we can determine the future is by a consideration of the past and that in looking to the future we must take into consideration known changed conditions that we must necessarily expect and also changed conditions which we may reasonably expect. Therefore, if it is assumed that the future gross operating income of this company—just taking the gross income from the receipts of gas, assume that the same volumes [fol. 730] of gas are sold on the same schedule prices which now obtain. We have our top figure. Then, to determine whether our existing rates will be too high over

these next five years, we must see what is going to be the picture as to the expenses of producing and delivering that gas, so as to have the proper idea.

This testimony is offered for the purpose of showing what this cost is going to be over this period of years so that it may be related to the probable income if we assume that the same volumes of gas are going to be sold at the same prices as those that are now existing and for the purpose of determining, irrespective of whether the rates in the past have been excessive, whether those same rates would in the future be excessive. The evidence is also offered for the weight thereof on the rate of return in that this company is not static in its operations. It is a growing company, it has needed more money in the past and is going to need much, much more money in the future, if it properly serves the public. If it furnishes gas as needed, it must have very substantial capital expenditures.

We shall offer to show, later, something with respect to what we consider the future of this company to be, the areas which it probably will serve. For the purpose of showing that the company must be in position promptly to obtain money to finance its operations and obtain that [fol. 731] money at a reasonable over-all cost, it being one of the well recognized, we think, principles that a growing company requires a greater indicated rate of return since it is going to require more money if it continues its growth.

If this were a company which had already reached the saturation stage and said, "We are satisfied with what we have done in the past; we are not wanting to do anything in the future," a slightly different position might be presented. Then, they could say; "It is an old, seasoned company, it requires no new money for its operations." But that isn't the case with this company.

We have offered in evidence here a graph showing the growth of this company in sales of m. c. f. over the period of the last five or six years. That has been a phenomenal growth. We have shown that during that same period of years there has been a tremendous increase in its plant account showing in the past; as it has obtained additional markets and as its additional markets have increased its

requirements, it has been forced to make additional capital expenditures. In connection with the drilling of wells we have already shown that we have been drilling an average of quite a good many, our gas purchase wells and our own wells together constituting about 172 wells that we have handled in the last five or six years, showing that we have had to tie on more wells in the past.

We are expecting a growth in the future which means [fol. 732] that we have to tie on more wells in the future. We have already shown that we have nearly doubled the size of our line in the last few years by looping, by the addition of more compressor stations and more power. We have added that power just as fast as the requirements of the business have justified and we expect to do that in the future.

We expect the business of this company to grow, that it will need more money, that it will serve more people and with the hope that it may serve them even more efficiently if possible.

Now, we realize that to do that we must keep, not up with the procession, we must keep ahead of the procession, because the natural gas pipeline company business is different from any other character of business. They can't tell us at one of the market towns today that they are going to need some more gas tomorrow and expect us to deliver it tomorrow, if we are just keeping up with the procession. We must have some pretty good ideas based on the past as to what we may expect in the future and then build for that future.

That is why we take the requirements which we anticipate. Then, when we get those requirements we realize that something must be done to that pipeline if we deliver those additional requirements, something must be done in the field, and we must get the wells drilled, we must [fol. 733] get the gathering lines laid, we must get the additions by way of pipeline and compressors to the pipeline all constructed before the need of their market takes place and to do that we must make these capital expenditures. In order to get the capital expenditures, we must necessarily go to the public and finance them and, in order to finance them, we must have such a rate of return as will attract capital to that type of investment.

* * * * * * *

[fol. 738] Q. Now, passing to the probable expenditures in the Hugoton field in 1942 on the two bases of loads, I note that under the basic load you provide for drilling 14 new wells in the Hugoton field and under the anticipated load 19 wells.

A. That should be 13 instead of 14, I think, because we drilled one of the 14 in 19—well, this fall.

Q. That is explained on page 22 that that 14 includes one well drilled in 1941. Is that the Guymon well that you have already testified about?

A. That is correct, yes, sir.

Q. Where do you expect those wells to be drilled?

A. They will all be drilled in what might be termed the south central part of Texas County, Oklahoma.

Q. Will you point that out on Exhibit 45, the general [fol. 739] location?

A. It is all leases which are colored brown that will have wells drilled on them during the year 1942.

Q. Now, in order to get the production from those wells into the pipeline in 1942, what do you have to do?

A. Well, we really have to start the construction of a gathering system for Texas County, Oklahoma portion of the Hugoton field. It is necessary that we build a 22-inch line commencing in Section 31, Township 4, Range 19, Texas County, Oklahoma and extending to the southeast corner of Section 34, Township 4, Range 16, Texas County, Oklahoma and it shows better on this. For the 14 wells—

Q. (Interposing) On Exhibit 44 it shows better, you say?

A. On 44, yes, sir, for the 14 wells the line shown in brown are the ones which will be necessary to carry the gas from the leases which will be drilled during 1942.

Q. Now, in constructing that gathering line, are you constructing it so as to take care of only the wells that will be drilled in that year?

A. No, sir, we have gone ahead in our study and laid out a gathering line which we believe will take care of all of the future wells to be drilled in the general vicinity to which each of the major arms of the gathering system extends.

Q. That line about which you have been talking, is that [fol. 740] the one from Section 31, Township 4 to near Optima, costing $324,000?

A. That is the trunk gathering line portion.

Q. All right, then you have an item to construct gathering line in Oklahoma connecting with the Optima line costing $856,000. Where does that line run?

A. That is the line that extends southwest from Optima down to the extreme end of the southernmost end which is just out of Goodwell, Oklahoma.

Q. Are you required in that year to do any additional work between Liberal and Hansford? A. Yes, sir.

Q. What work is that?

A. That is the looping of the present 22-inch line with a 26-inch line.

Q. I see you have listed as Item P the construction of the Cimarron River crossing for the loop line costing $220,000.

A. That is correct.

Q. How does that crossing compare with the one which is now there for the existing line?

A. It is going to be a larger crossing because we are a little short on capacity there right now and it is going to be four 16-inch lines and that price was obtained from the engineering department by getting bids from contractors and then adding the price of pipe on to the labor part of the [fol. 741] bid. I believe that I am right on that.

Q. All right. Now, you have items here for connecting well lines for 20 new wells. That is the 19 that will be drilled in 1942 and one well drilled in 1941, is that?

A. That is Item T?

Q. Item T, yes. A. Yes, that is right.

Q. That is the same type of well lines that you referred to in '41?

A. They are all 4-inch lines.

Q. And the same situation is true as to the measuring stations? A. Yes.

Q. And the same thing as to the employee housing, warehousing, new car garage, six-car garage, all of that being additional expenditures in your judgment required because of the loads which will be existing at that time?

A. Yes, sir, that is right.

Q. There is one item, Item U, ten well dehydrators, that I don't believe you referred to.

A. Well, the gas which is produced in Hugoton field is quite different from the Panhandle gas in the respect that

at the same pressure and same temperature we have far more freeze trouble in the Hugoton field and we have been working on that problem for the past several years.

[fol. 742] Now these ten well dehydrators that are mentioned here have not been located. The management has decided that we will try out these well dehydrators at points where we feel that they will be of the most benefit. They are not shown as located on the working papers anywhere.

Q. It is, to some extent, an experiment to see how it works out?

A. Yes, sir. We have several now that are.

Q. That are so far working?

A. Well, some of them work pretty good and some don't and that is the reason that we are spending this money, to try to take care of that problem in a better manner.

. . . . . .

Q. Item z-1 is to construct telephone line to serve Optima gathering line. Is that anything different from your present method of operation on the gathering line?

A. No, that is just an extension of our present telephone system which will be parallel to the pipeline which we have referred to as the Optima trunk gathering line.

Q. That is the area serving Texas County, Oklahoma?

[fol. 743] A. That is right, yes, sir.

Q. You have, also, as Item z-2, installing a radio station serving an area within a 50-mile radius of Hugoton. Do you have any telephone line which would serve that area?

A. No, sir, we made a survey of that last winter and tried to use some of the local farm lines out there, but they are in very bad shape and we found that from Hugoton we only had one point from which a chart changer could call, that is, from Ulysses, and for the reason we go all directions from Hugoton there, this two-way radio has been considered to be the best method of reaching the chart changers from the Hugoton Camp.

Q. Do you think there will be any saving to you in using that two-way station for that small area rather than build a regular telephone line to it?

A. Oh, there will be a great saving.

Mr. Littman: May I inquire what does that have to do with the anticipated load?

The Witness: It is on both the present and anticipated load. It is something that we need down there quite badly because, as we get a load change and our load changers have left the main camp, why then there is no way to go out and get them because you can't, unless you start somebody else right after them to catch them. That is if we want a load increase and they were already gone we have no way of [fol. 744] changing the volume of gas that is going into the line until they get back. If we had this radio, you see, they could be reached at any time and they could turn on or turn off the gas as needed.

* * * * * * *

By Mr. Culton:

Q. In other words, as I understand you would really like to have it now.

A. We would like to have had it about three years ago.

Q. All right. I notice a credit several different years through 1943, 1942, 1944 and 1945 for contributions by joint owner on account of acidation, liners or tubing, such as that.

A. That is true. We own a 50 percent interest in 34 wells which are connected to the main line and in 12 wells which are connected to the Argus Natural Gas Company. When any work is done on those wells we take care of the accounting and our partner is charged back with the amount of money that was spent.

* * * * * * * *

[fol. 745] Q. Now, in 1943 you have information respecting drilling of wells, installing liners, acidizing, constructing additional lines to serve new wells, constructing wells, lines, measuring stations, well dehydrators, and so forth. Are your explanations with respect to those items in 1943 the same explanation as to similar items in 1942 and prior years?

A. Yes, sir, the same method was used in each year.

Q. Was the same thing true as to 1944? A. Yes, sir.

Q. 1945? A. Yes, sir.

Q. And 1946 so far as similar items are concerned?

A. That is true.

Q. Mr. Hinton, in your judgment will the company be required during these various years, even if the load be not increased over and above the present load, to increase

its capital investment in the fields and lines in the amount shown under your basic load?

Mr. Littman: I object.

[fol. 746] Mr. Culton: During each of those years?

Mr. Littman: I object to that. I don't think this witness is sufficiently qualified to answer that question, if Your Honor please. He says he is not a geologist. He says these are not his own estimates. The whole thing is predicated on the assumption as to increased load handed to him by another witness. I think the record as it now stands eloquently demonstrates that this witness is in no position to answer that question with any authority.

* * * * * * * *

Trial Examiner: I think the objection is strictly good, gentlemen. Mr. Hinton has presented an exhibit here which is fully itemized, including various estimates made by others and based upon other proposed exhibits, namely, 40 and 41. I think Mr. Culton, the exhibit speaks for itself and the question should not be allowed.

* * * * * * * * *

[fol. 751] Trial Examiner: These exhibits which are now tendered in evidence will be subjected to cross-examination and ruling deferred as to their admission.

* * * * * * * *

[fol. 753] C. H. M. Burnham, having been previously sworn, resumed his testimony.

Direct Examination: (Continued)

By Mr. Culton:

* * * * * * * *

Mr. Culton: Mr. Examiner, a tabulation has been passed around entitled "Future Capital Requirements Gas Transmission Facilities, Liberal Station and Eastward", Witness Burnham.

We would like to have that marked exhibit 47 for identification.

Trial Examiner: It will be so marked.

* * * * * * * *

Q. Mr. Burnham, have you prepared a tabulation with respect to the future capital requirements of Panhandle Eastern from the Liberal Station eastward?

A. I have.

[fol. 754] Q. In making that computation, did you take into consideration any assumed market requirements of m. c. f. of gas?

A. I did.

Q. What assumed requirements did you take into consideration in that computation?

A. Mr. Morton's estimate.

Q. Is that the estimate which has been offered in evidence as exhibit 40? A. It is.

Q. Showing the estimated main line sales from 1941 to 1946, inclusive? A. That is correct.

Q. What part of the system did you consider in your study?

A. I considered the main transmission system from Liberal Compressor Station east to the terminus of the line.

Q. And what did you consider as the terminus of the line? A. Dana, Indiana.

Q. In determining the sufficiency of the existing transportation facilities, such as pipe lines, compressor stations, and so forth, to handle increasing loads, from what part of the line do you start to make your computations?

A. It is proper for the designing engineer to begin at the point farthest removed from the source of supply, and [fol. 755] design backwards, as you might say, toward the source of supply, station by station and loop by loop, until he reaches the source.

Q. Now, in addition to making the computations with respect to the main line itself, that is, from Dana westward, did you make any computations with respect to requirements for markets which the company expects to serve within the next five and one-half years which are not at this time being served?

A. I did.

Q. Will you go to exhibit 15, and starting at Dana, explain to the Examiner, just exactly how you made your study in order to determine where necessary capital expenditures will be required for certain loads.

By the way, is that method you referred to anything unusual or do you do it ordinarily?

A. It is the very usual thing to do.

Q. By whom? A. By the engineers.

Q. As far as this company is concerned, have you had any previous experience in the past?

A. Yes, indeed.

(Going to the map) At Dana we have an assumed quantity of gas to be delivered, or estimated quantity is probably better, and we also have a delivery pressure to maintain there.

[fol. 756] We take this quantity of gas and by applying the proper formulae, we work backwards or westward on our main line system to the next point of delivery.

Q. Where would that be?

A. That would be this line (indicating) that leads from our main line system up to Danville, Illinois.

Q. Is that a lateral line?

A. That is a lateral line.

Here we pick up the delivery of gas which Danville will require on the peak day.

Q. That is in addition to the gas required at Dana?

A. It is.

Q. All right.

A. From Danville then, we proceed westward carrying this increased quantity of gas to the next point of delivery.

Which is the lateral line leading to Urbana and Champaign. Here we pick up the quantity of gas to be dropped off at that point. We bring then the sum of the deliveries to be made at Dana, Danville, Champaign and Urbana into the first compressor station which is, in this instance, Tuscola compressor station.

Now, if the pressure indicated by our formulas is in excess of 500 pounds in this station, that indicates that we [fol. 757] do not have enough pipe capacity between Tuscola Station and Dana, so then the calculator must go back, properly install another loop in his computation and work back to Tuscola until he ends at Tuscola with an operating pressure for which the equipment is designed to meet.

The Tuscola compressor station will operate at a certain ratio of compression, that is, a certain ratio between the discharge pressure and the suction pressure, so again we start a new problem, as you might say, of designing between Tuscola Station and the next station to the west.

We pick up at Tuscola station the fuel required for the Tuscola station on the peak day and add it to the total quantity that we have carried back to Tuscola station.

In a manner similar to the manner just described as coming back from Dana to Tuscola, we proceed on westward to Glenarm Station, picking up the various markets as they come off the main line system.

Q. Mr. Burnham, the method is clear enough, isn't it, Mr. Examiner, without carrying the same principle all the way back to the beginning. Without taking the time to explain that all the way back to Liberal compressor station, is that same method followed as you go back westward, picking up the additional loads as you go westward?

A. It is.

Q. And then when you get to the station at Liberal, you [fol. 758] know exactly how much gas your line will be able to furnish at given pressures to serve all of the markets in the aggregate.

A. We do.

Q. Now, do you sometimes in addition to looping add additional power for the purpose of more easily transporting the desired volumes of gas?

A. There is a certain economic balance between power and pipe which will result in the greatest economy in a transportation of this gas, and we strive to work within close limits to that economic balance.

Q. You have noted here on exhibit 47 an expenditure for Southern Michigan, North Line, in 1941, and will you point out to the Examiner where that is located as shown by exhibit 15?

A. The Southern Michigan North Line begins a short distance inside the Michigan State Line.

Q. Making a connection with what line?

A. Michigan Gas Transmission Line to Detroit.

Q. All right.

A. And extends northward to a proposed junction west of Ann Arbor, Michigan. The north line thence extends in a northeasterly direction to a proposed junction southwest of Pontiac, Michigan. The line thence proceeds northward to a point near Flint and thence northwest to a point near Saginaw, Michigan.

. . . . . .

[fol. 767] Q. Mr. Burnham, in line No. 5 of Exhibit 47, you show certain lateral lines. What do you mean by "lateral lines"?

A. Lateral lines are lines leading off of already existing feeders, and the items shown there involve lateral lines which I shall indicate on the map to Galesburg, Illinois, to Abington and Knoxville, also in the State of Illinois, to Greenfield, Indiana which is not shown on this map but it is a town directly east of Indianapolis, to Adrian, Michigan, where a lateral line takes off of our north line at a point about midway between the junction with the Michigan Transmission System and the junction just west of Ann Arbor.

Q. In other words, those are lines for the purpose of tying the cities into the general distribution line that you have there, that is, connecting to the companies' own transmission line?

A. Yes, and to fulfill contract terms already entered into.

Q. I see. What progress has been made with respect to doing the work necessary in 1941, under your additions to the main line?

A. We have already secured the right-of-way for main [fol. 768] line additions in Illinois and Missouri, and some in Kansas.

Q. Are those particular areas in which you do the additional main line construction in 1941 indicated in any particular way on exhibit 15?

A. They are shown in purple dotted lines.

We have already received a considerable amount of material for these lines with the exception of pipe. That material is in warehouses, strategically located so that construction can proceed immediately upon the receipt of pipe.

We have let the contracts for the construction of the line, main line additions, in Illinois. We have bids on main line additions in Missouri and Kansas. I think that is the extent of our progress in respect to main lines construction.

Q. Now, were the prices which you used in showing the cost of additions to main lines—how were they determined?

A. They were determined from these contract prices, either entered into, or the low bidder on this work here in Missouri and Kansas. The pipe prices were secured in cooperation with the purchasing department. Other prices we already know because we have some of that material on hand. They have bought and paid for some of that other material.

. . . . . .

[fol. 769] Q. What is the situation as to the additions to compressor stations?

A. The items shown in line 3, additions to compressor stations, in the amount of $344,100, covers the addition of a compressor unit in each of our Illinois compressor stations, Tuscola, Glenarm and Pleasant Hill. The work at Tuscola and Glenarm is approximately 80 percent completed. The units are already installed but not in operating condition.

[fol. 770] The work at Pleasant Hill is, I would estimate, 60 percent completed.

The compressor unit has not yet been received but is promised for delivery on November 1.

Q. What is the stage of construction as to the Southern Michigan north line?

A. The progress made on the north line in Michigan consists of approximately 80 percent of our rights-of-way having been secured, practically all engineering work having been done, and involves, or rather progress has been made to the extent of numerous items of material having been received and placed in warehouses.

We have received in addition to these small items material involved in construction of a line such as this, about 13 miles of 12 inch pipe.

Q. How did you arrive at the cost of the estimated expenditure for the Southern Michigan north line?

A. The contract for the work in Southern Michigan has already been let. We used, therefore the contract prices for the labor and for the pipe and materials; as I have said before, we used prices secured through the cooperation of the purchasing department.

Q. Is that program also contingent on being able to get some additional pipe to complete the work?

A. It is.

[fol. 771] Q. The lateral lines, what is the situation with respect to lateral lines shown on line 5?

A. The Galesburg lateral line involves the lifting of a lateral line in Kansas known as the Mildred lateral line, and the purchase of sufficient additional 8 inch pipe to complete the 40-some mile of line involved.

We have an application before the Commission, as I understand it, for permission to lift the Mildred lateral and make that pipe available.

Mr. Littman: You mean before the Federal Power Commission?

The Witness: Yes. The contract has been negotiated for laying this line. The rights of way have been taken. The engineering work has been done. Some materials are already on hand.

By Mr. Culton:

Q. How did you arrive at the cost of that line?

A. We used the contract price for the cost of laying, and I have used, in the case of the Galesburg line, the cash required to lift the Mildred line and re-lay it in its new location in Illinois.

Now, the other lateral lines in Illinois are in this situation:

The rights of way to Abington and Knoxville have been secured; some materials are on hand but no pipe is on hand for those two towns.

[fol. 772] So much for the lateral lines in Illinois.

In Indiana, we are presently engaged in laying the line to Greenfield. Pipe is on hand and the work is progressing very rapidly.

Another item under lateral lines, in line 5, is the line to Adrian, Michigan. Rights of way have been taken on that

line, the pipe has been requisitioned. I do not know whether the order has been placed for pipe or not. I believe that covers the discussion.

Q. That covers the discussion of your lateral lines. I notice in 1942, in 1944, in 1945 and in 1946, you have different items for additions to main lines.

Is your method of determining when those additions to main lines will be required similar to that which you used in connection with 1941 except taking into consideration added demands as the years passed by under Mr. Morton's estimate?

A. That is correct.

Q. When do you get the main line completely looped under that program which you have there?

A. In the year 1942.

Q. Then, what are the items shown on lines 20, 24, 25 and 30 as additions to main lines?

A. I believe that is item 21, that is the first one.

Q. You are right.

[fol. 773] A. Those are the estimated investments which this company will be required to make in a third line, or loops constituting a third line.

Q. If the anticipated requirements materialize?

A. That is correct.

Q. Is that looping the same type of looping you are now doing on other work? A. Yes, it is.

Q. And you determine the points at which that looping will be required for each of those years by the same method used in determining the other loop?

A. That is correct.

Q. I notice that in 1942, 1943, 1944, 1945 and 1946, during each of those years, you have additions to compressor stations. Has the necessity for those stations been similar to those which will require additions in 1941?

A. Yes.

Q. Resulting from future increases and load requirements? A. That is correct.

Q. Now, in 1942, under line 11, you have the South Michigan West Line.

Explain to the Examiner just what that is.

A. The South Michigan West Line originates at this junction point west of Ann Arbor, and extends for a [fol. 774] distance of approximately 82 miles to a point near Kalamazoo, Michigan. It is to be built of 16 inch pipe as far as Battle Creek and 12 inch pipe from Battle Creek to Kalamazoo.

Q. Has any of the rights-of-way been obtained for that as yet? A. No.

Q. It is merely in prospect at this time?

A. We are preparing maps, getting ready to take rights-of-way.

Q. Yes. When do you expect to start the rights-of-way men to work on that line?

A. Within the next week or two.

Q. In 1942, 1943 and 1945 you have additions to gasoline and dehydration equipment.

What is the necessity of those items?

A. Our gasoline dehydration plant is already up to load, in fact, this coming winter we anticipate we will have to by-pass some gas around this plant.

Q. Then, the necessity for these increases is the same as the loop lines—as the additional markets come on you require additional facilities to dehydrate the additional gas; is that, in substance, it?

A. That is right.

Q. Item No. 12—line 12, for 1942, is telephone line east—

. . . . . .

[fol. 775] Mr. Culton: Mr. Burnham, what is the subsidiary company referred to on your caption sheet, the caption of exhibit No. 47?

The Witness: The Illinois Natural Gas Company, a wholly owned subsidiary which owns all the lateral lines in Illinois and will own the lateral lines to be built from our Peoria line to Galesburg.

. . . . . .

Q. What is true as to the Michigan situation? Do you have any subsidiary there?

A. Well, the Panhandle Eastern Pipe Line Company is conducting this work in Michigan and it has—

Q. (Interposing) There is no existing subsidiary of Panhandle Eastern Pipe Line Company except the Illi-
[fol. 776] nois Company; is that correct?

A. That is correct.

* * * * * * * * *

Mr. Williams: The point of origin of the Michigan lateral lines, is that within the material limit of the State of Michigan?

The Witness: As I just testified, it originates at a point just inside the State of Michigan.

By Mr. Culton:

Q. And intersects no state line at all?

A. None whatever.

* * * * * * * * *

[fol. 777] Mr. Gorman: Do I understand correctly that the Illinois Natural Gas Company is merely a corporate convenience but for all intents and purposes it is considered as a part of The Panhandle Eastern System?

The Witness: I would prefer not to answer that.

Mr. Culton: I will say that is a legal question, but the company so considers, and it has taken that position, I think, in a little contest with the Illinois Commission.

Counsel is probably familiar with that.

By Mr. Culton:

Q. I believe I started to ask you to discuss line 12, the telephone line east, in 1942.

A. With the completion of a completely looped system from Liberal to Dana, and considering the greatly increased loads which would be carried by that completely looped system, it would be necessary that the company extend its telephone—present telephone system across the state of Missouri and Illinois and connect with each and every compressor station along the line in those two states.

At the same time we propose to put in drops or connections at or near each of the main-line gate-valves where cross-over connections are available, between the two lines.

We also contemplate having telephone lines into our warehouses so that we will be in complete communication

at all times with the employees and points of operation, [fol. 778] important points of operation, on our line, east of Kansas City.

Q. In other words, the company now has a line covering all of its property west of Kansas City?

A. Yes, sir. It has and which line serves our field system.

Q. In all three States? A. In all three states.

Q. Will you explain why it is necessary to have a telephone line for the proper operation of the company's business?

A. As I stated before, this increased load will require much closer attention to the operating conditions at these compressor stations. When the compressor stations are connected with each other with two lines, rather than a partially looped single line, the response to pressure increases will be much quicker, or to state it conversely, should be much quicker and will require much closer attention from the central office in Kansas City.

Q. What method are you now using to handle such matters east of Kansas City?

A. We depend upon the commercial lines for communication now, that is, telegraph and telephone and we have found it highly unsatisfactory under some conditions.

Q. I see you have reference to lateral line, 1942, line No. 13.

What are those? Additional lateral lines for South [fol. 779] Michigan West Line?

* * * * * * * *

A. That is the lateral line to Bloomington, Illinois, a fairly good-sized city south and east of Peoria. As I stated in my testimony in September, we are about to secure a contract to cover the requirements of Bloomington, Illinois.

Q. The company has in mind serving that area at any rate? A. It does.

Q. I notice on line 14, we have a warehouse at Paola.

Mr. Littman: Pardon me. Will you please show us the lateral you just described, the Bloomington lateral? From what point does it run, to what point?

* * * * * * * *

The Witness: Bloomington lies about 29 miles east of our Peoria lateral and somewhat southeast of Peoria itself. We propose to build a line from the Peoria lateral also due east to Bloomington.

* * * * * * * * *

Mr. Littman: It would run from a point on the lateral in Tazewell County over to McLean County and what is [fol. 780] the approximate length of that line?

The Witness: I just stated approximately 29 miles.

* * * * * * * * *

By Mr. Culton:

Q. All right, the Paola warehouse.

A. We find, I might say that Paola is located in Miami County, Kansas, a short distance from the Louisburg compressing station. We find that the company has slightly outgrown the Paola Warehouse and we contemplate substantial additions to that warehouse.

Q. I believe you discussed all the separate items. Now, will you tell us the aggregate of the estimated capital requirements for the year 1941, the remainder of the year, in order to satisfy the estimated requirements?

A. The aggregate shown here for 1941 is $8,993,700.

Q. And for 1942? A. $6,791,300.

Q. And for 1943? A. $3,768,800.

Q. And for 1944? A. $6,684,100.

Q. And for 1945? A. $7,087,100.

[fol. 781] Q. And for 1946? A. $3,617,600.

Q. Making a total of how much? A. $36,942,600.

* * * * * * * * *

[fol. 782] Q. What prices did you use in subsequent years after 1941?

A. I used the same unit prices as existing today.

* * * * * * * * *

Trial Examiner: Did you make all these estimates or were they made under your direct supervision?

The Witness: Under my direct supervision.

Trial Examiner: Does the growth loads and anticipation and so forth—you were relying on exhibits 40 and 41?

The Witness: I was.

By Mr. Culton:

Q. Mr. Burnham, do you know how the prices, unit prices for extensions of gathering lines and similar facilities which were used by Mr. Hinton were obtained by him? Were they obtained from your department?

A. They were prepared in my department under my direction and were obtained from my department.

. . . . . .

[fol. 796] Mr. Culton: Mr. Gorman, the record may not be fully complete.

. . . . . .

Mr. Littman: As I indicated a moment ago, Mr. Burnham, I wanted to ask you a few questions with respect to [fol. 797] Exhibit 47 before proceeding with cross-examination of the exhibits that you prepared for presentation at the previous hearing.

Calling your attention to line 5 on Exhibit 47 entitled "Lateral Lines" in the amount of $463,800, does that refer entirely to the lateral to be transferred to the State of Illinois and to be installed between Peoria and Galesburg, approximately, or does that include another lateral?

The Witness: That includes five lateral lines and I shall give you the names and the amounts.

Mr. Littman: Will you please do that?

The Witness: Adrian lateral, $47,914, Adrian, Michigan.

Mr. Littman: Which one is that?

The Witness: Adrian, Michigan.

Galesburg, Illinois lateral, $291,500; Abingdon, Illinois lateral, $38,500; Knoxville, Illinois lateral, $2,600; Greenfield, Indiana lateral, $83,300. In adding those five together I rounded off the figures to the even hundred.

Mr. Littman: Now a part of the Galesburg lateral will consist or be composed of pipe that will be removed from the present Mildred lateral in Kansas?

The Witness: That is correct.

Mr. Littman: How much of the $291,500 is represented by the present Mildred lateral in Kansas?

The Witness: The $291,500 is an item which is composed of the cash required to do that job and includes no [fol. 798] pipe whatever, that is insofar as Mildred is concerned. It does include pipe to the amount necessary to make up the difference between the length of the pipe to be recovered from the Mildred lateral and the total distance to Galesburg.

Mr. Littman: I see. In other words, there will be charged on the books of the Illinois Natural Gas Company only the cost of removing and hauling and relocating the Mildred lateral line.

. . . . . .

The Witness: I believe I can answer that this $291,500 item isn't intended to be the amount charged on the books at all. It is the cash, as I said before, required to bring about this change.

Now, what the company's books reflect after the change has been made I cannot give you an exact figure.

Mr. Littman: Well, does that amount include the cost of the pipe?

The Witness: There is no cash involved insofar as the pipe in Mildred lateral is concerned. The cash involved is in lifting Mildred lateral, moving it to Illinois, relaying it and buying enough new pipe to make up the difference and laying it.

[fol. 799] Mr. Littman: And does not reflect the cost of the pipe, itself, that is insofar as the Mildred lateral is concerned?

The Witness: It does not, it does not reflect that.

. . . . . .

[fol. 800] Mr. Williams: Do you know whether or not these items as given by you include interest during construction?

The Witness: They do.

Mr. Williams: Can you state what interest rate was used in computing interest during construction?

The Witness: No, but my working papers will show the amounts charged into these estimates for interest during construction.

Mr. Williams: Will your working papers show the period of time over which interest is charged?

The Witness: Yes, it will show the period of time during which construction will be pursued and I assume that interest will be charged during that period.

. . . . . .

[fol. 801] Cross-Examination.

By Mr. Littman:

Q. Mr. Burgham, you testified on direct examination that the Panhandle Eastern Pipe Line Company serves through its system, directly or indirectly, some 200 cities and communities having an aggregate population of upwards of 3,000,000 persons, did you not?

A. I believe I did.

Q. Does Panhandle Eastern Pipe Line Company and its wholly owned subsidiary, Illinois Natural Gas Company, engage in any local distribution of natural gas?

A. It does not.

Q. Do they own any facilities for the local distribution of natural gas?

A. They do not.

Q. What proportion of Panhandle Eastern Pipe Line Company's gas is delivered to Detroit, approximately?

A. In the order of 40 percent, I should say.

Q. Do I correctly understand your direct testimony to be that Panhandle Eastern Pipe Line Company produces and purchases natural gas in Texas, Oklahoma and Kan-

[fol. 802] sas and transports that gas by means of its own pipeline system through those states and through the states of Missouri and Illinois as far east as the Illinois-Indiana state line?

A. That is correct.

Q. And is it also a fact that such natural gas is transported for Panhandle Eastern Pipe Line Company by

Michigan Gas Transmission Company from the Illinois-Indiana state line in a generally easterly and northerly direction through the states of Indiana, Ohio, Michigan as far as the City of Detroit, Michigan by means of Michigan Gas Transmission Corporation's pipeline?

A. That is correct.

Q. At what point does the gas of Panhandle Eastern Pipe Line Company first enter the pipeline of Michigan Gas Transmission Corporation?

A. At our measuring station located at Dana, Indiana.

Q. Is Dana measuring station located in Indiana?

A. It is, just a few hundred feet across the state line in Indiana.

Q. Does Panhandle Eastern Pipe Line Company own any property in Indiana, Ohio, or Michigan?

A. It owns property in Indiana, to the extent of that two or three hundred feet that I just mentioned and it is now acquiring more property in Indiana as a result of the construction of this lateral line to Greenfield, Indiana. To [fol. 803] my knowledge it owns no property in Ohio and it goes without saying that it is acquiring property in Michigan to the extent of its new construction work in that state.

. . . . . .

Q. Now, the Greenfield lateral has not yet been completed, has it?

A. No.

Q. How far has the construction progressed?

A. The pipe is on the ground, the contractor is on the ground, the rights-of-way have been secured and I should believe that by now active construction is being engaged in.

Q. Who is going to own that line when it is completed?

A. Panhandle Eastern Pipe Line Company.

Q. Well that will be, then, the only lateral running off Panhandle Eastern's main line, I mean off Michigan Gas Transmission Corporation's main line that will be owned by Panhandle Eastern Company when it is completed. Is that correct?

A. In Indiana?

[fol. 804] Q. In Indiana, yes.

. . . . . .

Q. Well now, Panhandle Eastern Pipe Line Company sells gas in Indiana, Ohio, and Michigan, does it not?

A. We have customers in Michigan, the Michigan Consolidated Gas Company and we sell gas to the City of Monroe. In Ohio we have several customers. In Indiana I do not know whether they are our customers or the Michigan Gas Transmission Company's customers that they serve there at the present moment.

. . . . . .

Q. Might not your schedule 2 of Exhibit 17 refresh your recollection on that score, Mr. Burnham?

. . . . . .

[fol. 806] The Witness: We have one customer now, as I look over the schedule, in Indiana.

By Mr. Littman:

Q. What is the name of that customer?

A. Kentucky Natural Gas Corporation, another pipeline company.

Q. And you have customers in Ohio, do you not?

A. Yes.

Q. I don't recall whether you have mentioned those or not. A. Well, they are shown on page 3, Schedule 2.

Q. Page 3 of Schedule 2.

. . . . . .

Mr. Littman: Will you name the customers in Ohio?

The Witness: Central States Natural Gas Company, Ohio Gas Light & Coke Company, The Toledo Edison Company.

Q. Does the Panhandle Eastern Pipe Line Company sell gas to the Michigan Gas Transmission Corporation? [fol. 807] A. Yes, we do.

Q. In other words, I take it that Michigan Gas Transmission Corporation is not only a vendee of gas of Panhandle Eastern Pipe Line Company, but also transports gas for and on behalf of Panhandle Eastern Pipe Line Company. A. It does.

Q. Can you state generally under what arrangement, and I say just generally, Panhandle Eastern Pipe Line Company delivers gas in Indiana, Ohio and Michigan with-

out, itself, owning any facilities in those states other than the facilities which you mentioned a few moments ago?

A. Panhandle Eastern Pipe Line Company pays Michigan Gas Transmission Corporation a consideration for the transportation of that gas.

Q. And, in turn, Michigan Gas Transmission Corporation delivers Panhandle Eastern Pipe Line Company's gas to Panhandle Eastern Pipe Line Company's customers in those states? A. That is correct.

Q. To wit, Ohio, Indiana and Michigan?

A. That is correct.

. . . . . .

[fol. 809] Q. Does this exhibit, No. 17, Schedule 2, show all of the customers in Column A of Panhandle Eastern Pipe Line Company, Illinois Natural Gas Company and Michigan Gas Transmission Corporation?

A. It does, as of June 30, 1941.

Q. Are the sales by Panhandle Eastern Pipe Line Company and Illinois Natural Gas Company to the customers shown in Column A of Schedule 2 of your Exhibit 17, sales of natural gas for resale for ultimate public consumption for domestic, commercial and industrial use in the communities shown in Column C of that schedule?

A. They are.

Q. Will you please turn to Schedule 3 of your Exhibit 17? Does that schedule show all of the industrial customers receiving natural gas from Panhandle Eastern Pipe Line Company and Illinois Natural Gas Company?

A. It does.

Q. Are these industrial sales what might be called sales for resale or not? A. They are not.

Q. Are there any sales not for resale made by Panhandle Eastern Pipe Line Company other than those shown in Schedule 3 of Exhibit 17?

A. Not to my knowledge.

. . . . . .

[fol. 812] Q. Well now, Panhandle Eastern Pipe Line Company sells gas to certain customers which gas does not at any time flow through the Panhandle Eastern Pipe Line Company's main transmission line, does it not?

A. That is correct, in one instance that I know of.

. . . . . .

Q. And what is that instance?

A. The Argus Natural Gas Company, Inc.

Q. Will you elaborate on the Argus Natural Gas Company, the sales of it, and tell us approximately where the properties are located and generally the nature of the transaction?

A. The properties are located in southwest Kansas near the Hugoton field and its principal market is Dodge City, if my recollection is correct.

Trial Examiner: Your exhibit shows Garden City, does it not?

The Witness: Yes, that is true.

* * * * * * * * *

[fol. 813] A. Well, then I am mistaken. Garden City is the principal community which is served instead of Dodge City and we have a contract to supply a certain portion of those markets at the wells, delivered into their pipelines.

* * * * * * * * *

Q. Mr. Burnham, would you state whether or not Argus takes the gas from Panhandle Eastern Pipe Line Company at the wellhead of the wells of Panhandle Eastern?

A. I believe I have already stated that to be the case.

Q. Will you please, again, refer to Exhibit 15 and state at what point the main transmission line of Panhandle [fol. 814] Eastern Pipe Line Company begins?

A. We consider the main transmission system to begin at Liberal, although under some interpretations and definitions you might consider the beginning at Sneed station, however, I prefer the definition to the effect that the main transmission system begins at Liberal station.

* * * * * * * * *

Mr. Culton: You mean you consider that beginning at Liberal because from an operating standpoint that is your understanding, but from a classification of accounts stand-[fol. 815] point it starts at Sneed?

The Witness: That is correct, sir.

* * * * * * * * *

Mr. Littman: Well, let's determine the fact; that is the operating fact. That line running from Sneed compressor station north and east to Liberal compressor station is a 22-inch line?

The Witness: That is correct.

Q. And isn't it a fact that all of the Texas gas, both produced and purchased, which enters the main transmis-[fol. 816] sion line or which enters the transmission line of Panhandle Eastern Pipe Line Company comes into that line at Windmill Junction south of Sneed compressor station, does it not?

A. Substantially that is correct.

. . . . . .

[fol. 817] Q. Are you now prepared to answer the question, Mr. Burnham?

A. Yes, I am. The production is received from the [fol. 818] King Oil Company into our 22-inch line, a short distance northeast of Windmill Junction and that is all the gas that constitutes, along with the gas that comes in at the junction point, all the gas that is transmitted through that 22-inch line.

Q. And the point that you refer to with respect to the two wells is south, is it not, of Sneed compressor station?

A. Yes.

Q. Can you state how far south of Sneed compressor station?

A. I would say about three-quarters of a mile.

Q. And what is the distance between Windmill Junction and the Sneed compressor station, along the transmission line? A. Two and two-thirds miles.

. . . . . .

Q. Now, isn't it a fact therefore, to make it clear, that no Texas gas enters the main transmission line north of Sneed compressor station?

A. That is the situation today.

. . . . . .

[fol. 819] Q. Now, tracing the main transmission line north from Sneed compressor station to Liberal compres-

sor station, at what point or points does Oklahoma or Kansas gas enter that line?

A. There is no Oklahoma gas nor Kansas gas in the line at that time.

Q. I think there is one. A. In Oklahoma?

Q. Texas County, Oklahoma, is there not a main line delivery from the Cimarron Utilities Company?

A. I am sorry, but I believe that is correct.

Q. You don't know of any others, do you? A. No.

Q. Neither do we. Does any gas enter the main transmission line of Panhandle Eastern Pipe Line Company between Liberal compressor station in Kansas and Dana measuring station near the Illinois-Indiana state line? That is quite a distance.

A. My knowledge is more complete in this respect. There is no gas entering the main line system between Liberal compressor station and Dana, Indiana.

Q. Now, going back to Liberal station for a moment, that is back to Liberal compressor station for a moment, will you describe the gas that enters at or near the Liberal compressor station, that is, tell us the source of that gas, please?

[fol. 820] A. The gas entering the main line system at Liberal compressor station is gathered from the Hugoton field in Kansas which Hugoton field extends down into Oklahoma and Texas, but at the moment no production is delivered into our system from Texas, it being derived entirely, insofar as the Hugoton field is concerned, from Kansas and Oklahoma, a very small quantity of gas being produced from Oklahoma.

Q. And that Oklahoma gas is wholly purchased, isn't it? A. That is correct.

Q. And the Kansas gas is both produced and purchased? A. Yes.

Q. Does any of the so-called local area gas in eastern Kansas and western Missouri near Kansas City at any time enter the main transmission lines of Panhandle Eastern Pipe Line Company? A. No, it does not.

. . . . . .

Mr. Littman: If Your Honor please, I wonder whether counsel for Panhandle Eastern Pipe Line Company and I take it you are also counsel for Illinois Natural Pipe

Line Company, would be willing to stipulate on this record that Panhandle Eastern Pipe Line Company and Illinois [fol. 821] Natural Gas Company engage in the transportation of natural gas in interstate commerce and in the sale in interstate commerce of such gas for resale and are natural gas companies within the meaning of the Natural Gas Act.

I wonder whether counsel would be willing at this time to stipulate into the record what I have just read.

Mr. Culton: I don't know that we can do that in all of its ramifications. We probably have a legal conclusion. I think there is no question but what the operations of the two companies, together, reflect an interstate transaction and we have not raised any question on the matter.

I will say this, counsel, that we are taking a position somewhat similar to what counsel has indicated in a case which is now pending in the Supreme Court of the United States where the Supreme Court of Illinois held to the contrary with respect to the Illinois Natural Gas Company, therefore, we would hesitate to formally stipulate something which might turn around and hit us if the Supreme Court holds that both we and the Power Commission are wrong in the present contention.

I will say this, that we are not at this time making any contest of the propriety of the Commission's making this investigation, based on a procedural question, nor are we making any contention other than that we recognize that the Illinois Natural is nothing in the world but an operat- [fol. 822] ing department or arm of the Panhandle Eastern Pipe Line Company.

Trial Examiner: That statement is made in spite of the separate corporate entity of the Illinois?

Mr. Culton: We are disregarding the separate corporate entity of those two companies in this investigation, Mr. Examiner. Our exhibits are prepared as if they are all one, the exhibits which we shall hereafter offer in evidence are all prepared on the assumption that the two are one.

We are taking that position in the case which counsel—counsel knows the case I am talking about—where we

are contending the Illinois Commission has no jurisdiction whatever over the Illinois Company.

Mr. Littman: That is, you are contending that the Federal Power Commission has jurisdiction?

Mr. Culton: We are contending that the Federal Power Commission has that jurisdiction and we think we are right, we think the Federal Power Commission is right. I have no objection to stipulating what the facts are but the conclusions, of course, are a different question.

Trial Examiner: Whether or not it heretofore appears in our record, is it a fact that the Illinois company is the wholly owned subsidiary of Panhandle?

Mr. Culton: At this time. In the past it has had other subsidiaries. In the past it has had distribution subsidiaries, Mr. Examiner, but that was dissolved sometime [fol. 823] back. There is no affiliation of any character between the present owners of that company and the Panhandle Eastern Pipe Line Company. The Illinois Corporation is its only subsidiary.

* * * * * * *

By Mr. Littman:

Q. Mr. Burnham, Panhandle Eastern Pipe Line Company has one gasoline extraction plant, has it not?

A. That is correct.

Q. Where is that plant located?

A. On the site of the Liberal compressor station.

Q. Why was the Liberal gasoline extraction plant constructed at Liberal?

A. Because the gas is gathered to this central point and it is more economic to build one large gasoline dehydration plant at one central plant than have several such plants scattered throughout the two fields.

Q. When was it constructed? A. In 1936.

Q. And 1937?

[fol. 824] A. And additions have since been made.

Q. Why was it necessary to extract the gasoline from Panhandle Eastern's gas by means of Liberal gasoline extraction plant?

A. Had the gasoline not been extracted, it would have condensed in our transmission system and would have

given us no end of trouble in trying to get the full flow efficiency of our system when needed.

Q. The gasoline extraction also makes the gas more merchantable, doesn't it? A. It does.

Q. And facilitates the transportation thereof, does it not? A. It does.

Q. In some respects, I presume, the extraction of gasoline from the line is analogous or similar to the dehydration process, is it not? A. In some respects.

Q. That is, in that it facilitates the transportation and aids in making the gas more merchantable?

A. That is correct.

. . . . . .

[fol. 826] Q. Do you know what part of the present system was in service on January 1, 1933?

A. The single, original single line and three compressor stations, to the best of my knowledge.

. . . . . .

[fol. 828] Q. What is the present maximum daily capacity of Panhandle Eastern, of the Panhandle Eastern Pipe Line Company system?

A. Approximately 250,000,000 cubic feet per day. That is sales capacity.

. . . . . .

Q. Will you state what you mean by "sales capacity"?

A. We design for a maximum day and we design for a maximum day sales so we always express the capacity of the system as sales capacity, gas that might be sold on a peak day.

Q. You mean deliverable capacity? A. Correct.

. . . . . .

[fol. 831] Q. What ultimate daily capacity of the system is now contemplated?

A. What do you mean by "ultimate", how many years?

. . . . . .

Mr. Littman: Let's take 1946, the last year of your proposed capital additions exhibits.

The Witness: For the winter of '46-47 we anticipate that our sales capacity must have been built to handle or

deliver the quantity shown on Mr. Morton's estimate for that winter.

Q. How much is that?

A. With a slight correction or reduction due to the fact that we design for a quantity resulting from deducting [fol. 832] from Mr. Morton's estimate the readily interruptable gas on that particular day, my figure shows we should have a capacity of 457,250,000 to carry the system peak on that day.

Q. On what day?

A. On the peak day of the winter of '46-47, which will, no doubt, occur in 1947 in January or February.

Q. Just to make certain of the understanding, shall we; Mr. Burnham, is your figure of 457,250 m. c. f. comparable to Mr. Morton—is that 457,250 m. c. f.? A. Yes.

Q. Is that figure comparable with Mr. Morton's figure shown in Exhibit 40, Line 11, at the bottom of that line or column rather, as 441,900 m. c. f.? I wanted to call that to your attention so as to make certain—

A. (Interposing) No, that is not.

Q. That is not comparable?

A. No, sir.

Q. Why isn't it, what is the difference?

A. All right, the figure which I gave you is the amount to be handled the winter following Mr. Morton's estimate there of 441,900,000. During that winter, as shown on Mr. Morton's estimate under 1946 we propose to design for a delivery of 429,900,000.

Q. That is compared with Mr. Morton's figure of what? [fol. 833] A. 441,900,000. The difference represents the readily interruptable gas which we shall shut off on that day.

. . . . . .

[fol. 834] Q. Were all of the compressor station sites obtained with the original right-of-way?

A. I think I testified to the fact that all were secured except two.

Q. And which were the two?

A. Hansford and Tuscola.

. . . . . .

[fol. 836] Q. Are you familiar with the construction problems encountered in connection with the building of the loop lines? A. Yes, I am.

Q. Does Panhandle Eastern Pipe Line Company have records showing the quantity of machine trenching and hand trenching employed in the construction of the original and loop lines?

A. I doubt if we have, of the original lines, but insofar as the loop line is concerned, in the last few years we have gathered that information and I shall be glad to furnish it to you.

* * * * * * * * *

[fol. 837] Q. I just have a few more questions here. What is the distance that gas is transported in the main transmission line from Sneed compressor station to Dana measuring station? A. 859.4 miles.

Q. From Sneed compressor station to the City of Detroit? A. Approximately 1200 miles.

* * * * * * * * *

[fol. 840] Q. Are you familiar with the company's practice with respect to letting contracts for construction and well drilling?

A. I am more familiar with the company's practice with respect to letting contracts for the construction of transmission facilities.

Q. Now, will you describe generally the routine or the practice in that regard?

A. Well, complete specifications are drawn up in the engineering department, maps are prepared and invitations to bid are sent out to not less than five, if five reputable contractors are available at the moment—

[fol. 841] Q. (Interposing) Ordinarily is it five or more or less?

A. Sometimes more but not ordinarily less, five or more. The contractors are usually given two weeks to four weeks to look over the rights-of-way, the problems involved in completing the construction and on a certain stipulated date they submit bids to the assistant secretary of the company, not to its engineering department.

The bids are opened by the assistant secretary and the contract is let.

Q. To the lowest bidder or not to the lowest bidder usually?

A. If the lowest bidder is a reputable contractor and if the lowest bidder is not engaged in other work at the moment.

* * * * * * * *

Q. If I may ask one more question with respect to your Exhibit 47, Mr. Burnham, referring you to line 4, Southern Michigan North Line, $3,893,300. Is that line going to be constructed in 1941?

[fol. 842] A. I am glad you asked me that question. In my estimation it is now physically impossible to get that line completed in 1941 and the same applies to the item on line two. This is because of the delay in receiving pipe, so I should say, generally, that items shown on lines 2, 4 and 5 will run over into 1942.

Q. Is the gas delivered to the Interstate Gas Company for resale in Harrisonville, Missouri taken from the main pipe line system?

A. Our local area system, I am very certain.

* * * * * * * *

Q. Well now, I think the record ought to be clear, Mr. Burnham, with respect to other such similar delivery.

Could you point out on your Schedule 2 other instances where gas is delivered to customers not from the main pipeline system of Panhandle Eastern?

A. Well, generally speaking, the customer receiving service from the local area system that is not getting gas out of the main line system was attached previous to the construction or completion of the main line system and if you will refer to the dates in the Column F you will get a very good idea of what customers received service from the local area system.

Q. Well do those customers never get any gas from the [fol. 843] main line?

A. Yes, indeed they do, and I testified in the hearing in September that on cold days it was necessary that we turn the main line gas into this local area system to reinforce the supplies of local gas and the day is fast approaching when local gas will probably be depleted to such an

extent that the great majority, I mean the greater part of this gas will be main line gas.

. . . . . .

[fol. 844] By Mr. Lee:

. . . . . .

[fol. 845] Q. What is the mileage of the Michigan Gas Transmission Company from Dana to Melvindale, the Detroit gate? A. Approximately 350 miles.

. . . . . .

[fol. 856] Leith V. Watkins, called as a witness on behalf of the Panhandle Eastern Pipe Line Company, being first duly sworn, was examined and testified as follows:

Direct Examination.

By Mr. Wheat:

Q. State your name and business address, Mr. Watkins.

A. My name is Leith V. Watkins. My address is 90 Broad Street, New York City.

Q. Do you hold any position at this time with the Panhandle Eastern Pipe Line Company?

A. Yes, sir, I am secretary-controller of Panhandle Eastern Pipe Line Company and its subsidiary company, Illinois Natural Gas Company.

. . . . . .

After completing high school, I entered Emory and Henry College at Emory, Virginia and remained there through my sophomore year. That was about 1910.

During the year 1911 I was a student at the Spencerian [fol. 857] Commercial School at Louisville, Kentucky where I took a course in accounting and finance. Almost constantly during my entire business career I have been a student of matters relating to specific and general accounting, operating and tax problems.

. . . . . .

I am a member of the Controllers Institute of America, of the American Gas Association and several of its committees.

. . . . . .

During the period from 1910 to 1926 I was a member of a staff of public accountants, a member of the staff of Clearing House Bank Examiners, staff auditor for corporations, officer of corporations and an instructor in advanced accounting in Y. M. C. A. night schools.

During the period from 1926 to 1931 I was a member of the staff in charge of the installation of operating and construction budgets of the General Auditor of Columbia Engineering and Management Corporation, assistant treasurer of Union Gas & Electric Company at Cincinnati, Ohio, and its associated companies.

During the period from 1931 to 1937, I have been assistant secretary, assistant treasurer and secretary and treasurer of Panhandle Eastern Pipe Line Company and its [fol. 858] subsidiary companies.

Also during a portion of that period from 1934 to 1937 I was secretary-treasurer of Columbia Oil & Gas Corporation and its subsidiary companies.

Q. From 1937 to date however, you have been secretary-controller of Panhandle Eastern Pipe Line Company and its subsidiaries during a portion of the time and its single subsidiary at this time. Is that true?

A. That is correct.

* * * * * * * *

As secretary of Panhandle Eastern Pipe Line Company and Illinois Natural Gas Company I have complete responsibility to the board of directors and to the president of those companies for the duties generally associated with the secretaryship of a modern-day corporation.

* * * * * * * *

As controller, instead of comptroller, of those companies, I am the chief accounting officer and, as such, I am responsible to the board of directors and to the president for all accounting matters, practices or policies and the wide variety of duties generally associated with and specifically assigned to the controller of a modern-day corporation.

[fol. 859] Q. Mr. Watkins, have you prepared for introduction in this proceeding an exhibit consisting of three pages headed "The Balance Sheets Per Books"?

A. Yes, I have prepared such an exhibit or have had it prepared under my supervision.

Q. And is the document which I now show you the document to which you refer? A. That is correct.

Q. And that was prepared under your supervision, was it? A. Yes, indeed!

Q. And do you believe it correctly shows what it purports to show? A. I do.

* * * * * * * * *

(Document Referred To Was Marked Exhibit No. 48 For Identification.)

Q. In preparing this document, containing certain balance sheets of the company, and also in preparing the income statement which will follow, have you generally [fol. 860] followed the forms prescribed by the Federal Power Commission in its uniform system of accounts for natural gas companies and also its forms for annual reports of such companies?

A. Yes, those forms have been generally followed, but I do not wish to have the fact that I have so followed those forms in making up these exhibits to be understood as a concurrence on my part or on the part of Panhandle Eastern Pipe Line Company and Illinois Natural Gas Company in the soundness, from an accounting standpoint, of certain of these forms or parts thereof.

* * * * * * * * *

Exhibit 48 for identification shows the assets and liabilities of Panhandle Eastern Pipe Line Company and subsidiary companies at December 31 each year, beginning with the year 1930, through the year 1940 and at June 30, 1941.

Q. Now, is it true that the assets covered by these balance sheets for each of these years are stated on page 1 of the exhibit and the liabilities for each of these respective years are stated on page 2 of the exhibit?

A. That is correct.

Q. So that by considering the asset column on page 1 for any particular year and comparing it with the liability column for that particular year on page 2, your complete

balance sheet for that particular year can be ascertained?
[fol. 861] A. That is correct.

. . . . . .

These assets, of course, are stated in this exhibit on the consolidated basis and have, therefore, been taken from the books and records of either Panhandle Eastern Pipe Line Company and whatever subsidiaries it owned at the dates for which the figures were respectively shown.

Q. Now, it is a fact, is it not, Mr. Watkins, that Panhandle Eastern Pipe Line Company did at one time own another corporation as a wholly owned subsidiary, which corporation is not now so owned?

A. As a matter of fact, it owned several other such corporations which corporations are not now subsidiaries.

Q. Yes, and is it a fact that the only subsidiary corporation now owned, wholly or in part, by Panhandle Eastern Pipe Line Company is Illinois Natural Gas Company?

A. That is true as of this date.

Q. As of this date. In this exhibit you have consolidated data from the books and records of both Panhandle Eastern Pipe Line Company and Illinois Natural Gas Company, have you not?

A. That is true, not only with respect to this exhibit, [fol. 862] but any other exhibits that this witness will offer.

Q. Yes. Now, without going into detail in respect to the items which are contained on Exhibit 48 for identification, I think that there are some items which might necessitate some slight discussion for a thorough understanding of their nature. For example, Mr. Watkins, will you state what the item headed "Other Investments" on line 3 of page 1 of Exhibit 48 for identification represents?

A. May I ask if that question is directed to the amount shown in Column F on line 3 of Exhibit No. 48?

Q. Yes.

A. Which is $214,298.25 as of June 30, 1941?

Q. That is right.

Mr. Littman: You mean Column M or Column F?

The Witness: "M."

The Witness: This amount represented on June 30, 1941, an amount due Panhandle Eastern Pipe Line Company by

Southwest Kansas Oil & Gas Company and Saturn Oil & Gas Company on open account amounting to $48,819.24—I beg your pardon, that represents four notes of equal amount dated January 6, 1936 of which one note is due each year during the years 1943 to 1946 and an open account due from the same companies amounting to $165,479.01.

[fol. 863] Q. Making the total shown by you in Column M, line 3 of page 1?

A. That is correct.

. . . . . .

Q. Is there any further explanation that you think should be made of that particular item of "Other Investments"?

A. I don't believe so, except that there might be some interest in the fact that as at the end of the year 1934 the amount shown as "Other Investments" in Column F on line 3 of Exhibit 48 was $180,240.68, whereas at the end of the year 1935 the amount had been reduced to $1.00. This change came about because of the reduction of investment of Panhandle Eastern Pipe Line Company's investment in capital stocks of two corporations dissolved during that year. The balance in this account rose at the [fol. 864] end of the year 1936 to the amount stated in Column H on line 3 or $150,146.84 by the addition of the notes and accounts receivable, previously referred to by this witness as explanation of the balance of $214,298.25 shown in Column M at June 30, 1941 on line 3 of Exhibit 48.

Q. Now, Mr. Watkins, what have you to say with respect to the item of "Special Deposits" in line 6 which I think might well be given some explanation?

A. Without refreshing my mind as to the balance at the end of each year, this account generally contains amounts placed on special deposits for some specific purpose, as an example the principal portion of the amount shown on line 6 in Column M of Exhibit No. 48, represents the balance of funds deposited with the company's corporate trustee, with Panhandle Eastern Pipe Line Company's corporate trustee for the redemption of its 4 percent bonds redeemed during the year 1941. The amount shown at the end of each of the prior periods represents similar transactions or transactions of a similar nature.

Q. The account varies from a high of something slightly under $9,000,000 now to a low of $660, does it not?

A. That is correct.

Q. Now looking down the page to line 10, "Accounts Receivable," have you any explanation which you desire to make in respect to that item?

. . . . . .

[fol. 865] A. The balance shown as "Accounts Receivable" over the years covered by this statement simply represents in some degree of relationship the growth of the company's business.

. . . . . .

Q. Now most of the other items on page 1 of Exhibit 48 are generally self-explanatory, are they not, Mr. Watkins? If you have any other items that you feel should be briefly explained, I wish you would do so.

A. Well, to the witness they seem self-explanatory.

Q. Yes, they so seem to be. Now, will you turn to page 2 of Exhibit 48 which is the page on which the liabilities for these respective years are shown? I draw your attention to line 6 entitled "Bonds" under the general heading "Long Term Debt" and also to line 7 under the same general heading, which is entitled "Miscellaneous Long Term Debt."

I would appreciate it if you would outline briefly what is disclosed on those two lines of page 2 in respect to the ups and downs of these two items.

A. The up and down of the two items referred to, shown on lines 6 and 7 of page 2 of Exhibit 48, is simply the re-[fol. 866] sult of the change in the portion of the company's financial structure represented by long-term debt during the years.

Q. For example, Mr. Watkins, I notice that the amount shown under the heading "Bonds" at the close of 1940 is $22,500,000 and that at June 30, 1941 that amount is shown as $18,250,000. Does that difference represent a portion of the refinancing operations carried on by the company early in this current year?

A. It does.

Q. And is the same true with respect to the increase shown between 1940 and June 30, 1941 in the other item, to-wit, "Miscellaneous Long-Term Debt"?

A. As to the principal portion of that change, yes.

Q. Now, I notice that that has risen from around $30,000 to slightly over $5,000,000. Is the $5,000,000 represented by certain notes at this time?

A. That is correct.

Q. Yes. Now, without going into detail on various other items down through line 16, I should like to ask you with respect to line 16, which is headed "Taxes Accrued," what is represented by the item shown in Column M for June 30, 1941 in line 16? In that connection, please feel free to consult the note shown on page 3 of this exhibit in connection with your explanation.

[fol. 867] A. The amount of $3,176,774.41 shown on line 16, Column M, page 2 of Exhibit 48, represents the total taxes accrued by Panhandle Eastern Pipe Line Company and subsidiary companies as of June 30, 1941.

Q. That includes both Federal and State taxes, does it?

A. It includes both Federal and State taxes and the Federal income taxes and excess profit taxes have been computed without regard to special deductions which result from the refinancing consummated during the early part of this year and without making provision for possible increases in rates or otherwise resulting from the Revenue Act of 1941.

* * * * * * * *

Q. Will you please give the detail of that item?

A. The detail of that item is as follows: Ad valorem taxes for the State of Texas for the year 1941, $17,400; for the State of Oklahoma during the year 1941, $6,000; for the State of Kansas during the year 1941, $132,000; for the State of Missouri during the year 1940-41, $97,478.66; for the State of Missouri during the years 1941-42, $8,400; for the State of Illinois during the year 1941, $42,600.

For gross production taxes in the State of Texas, $2,707.24. For the conservation assessment made by the [fol. 868] State of Kansas, $180.19. For the Federal capital stock taxes for the year 1940-41, $68,520. For capital stock taxes for the State of Illinois during the year 1941, $2,400. For Federal excise for old age benefits, $2,588.87.

For Federal excise for unemployment insurance, $1,597.54. Unemployment compensation for the State of Texas, $122.74; Kansas, $2,363.94; Missouri, $3,035.56; Illinois, $1,126.08; New York, $122.24.

For State income taxes for the year 1939, $15,418.21; for State income taxes during the year 1940, $31,625.49; for State income during the year 1941—$24,000; for Federal income taxes during the year 1938, $24,242.22. For Federal income taxes during the year 1939, $14,883.13. For Federal income taxes during the year 1940, $747,962.25. For Federal income taxes during the year 1941, $934,000. For Federal excess profits taxes during the year 1940, $480,000. For Federal excess profits taxes during the year 1941; $516,000.

Q. Now, the total of those figures is the total shown in Column M, line 16, page 2, is it?

A. That is correct.

Q. That represents, does it, the accruals made on the books of these two companies, consolidated during the first six months of 1941, or just how would that better be [fol. 869] stated?

A. Well, not necessarily during the first six months of 1941—

Q. (Interposing) It is the balance shown on the books as of June 30, 1941, is it not?

A. That is correct, because some of these taxes cover a period other than the year 1941.

Q. How does that come about, Mr. Watkins?

A. Without being facetious, by reason of the Acts of the State Legislatures, principally.

* * * * * * * * *

Mr. Wheat: Mr. Examiner, I offer Exhibit 48 for identification in evidence.

* * * * * * * * *

[fol. 871] Q. Now, Mr. Watkins, have you also prepared a document entitled "Income Statement Per Books, Period from April 1, 1932 to December 31, 1941"?

A. I have.

Q. And is the document consisting of two sheets which I now show you the study which you have just mentioned?

A. It is.

* * * * * * * * *

(The Document Referred to was Marked Exhibit No. 49 for Identification.)

Q. Was the data shown on this exhibit prepared by you or under your direction?

A. Under my direction.

Q. And do you believe that the contents of the data shown on Exhibit 49 for identification correctly show what they purport to show?

[fol. 872] A. I do.

Q. Now turning to Exhibit 49 for identification, turning now to Schedule 1, which is page 1 of Exhibit 49 for identification, I should like to ask you how you obtained the figures shown in Column M, which is 1941, January 1 to December 31.

A. The figures shown in Column M for the year 1941 represent the actual results of operation for the first six months of the year 1941, plus an estimate of the probable results of operation for the last six months of that year.

Q. May I ask whether that is true of any of the other figures shown in the other columns of this exhibit, in other words, are any of the other figures in Columns B to L, inclusive, estimated or are they actual?

A. They are actual.

Q. And only then in the instance of 1941, as shown on Note 1 on Schedule 1, are there estimated figures included?

A. That is correct.

Q. Now, will you look at line 3 under the heading "Income" and tell me what is included under the item "Gas"?

A. All the revenue received by Panhandle Eastern Pipe Line Company and its subsidiary company, Illinois Natural Gas Company, or any other subsidiary companies in-
[fol. 873] cluded in prior years is included in the item of "Gas" shown on line 3 in the various columns of Exhibit 49.

* * * * * * * *

Q. What do you mean by the item of "Pipe Line Rentals" in line 5?

A. Formerly Panhandle Eastern Pipe Line Company [fol. 874] transported gas for a period of a few years for another company, the transportation of the gas, as I re-

call, was for a distance of about 100 miles. The contract expired or the arrangement ceased during the year 1936 and there has been no such income since that year.

Q. Will you direct your attention to lines 19 and 20 of page 1 of Schedule 1, Exhibit 49, which are respectively headed "Federal Income" and "Federal Excess Profits" under the center heading of "Taxes" and particularly the items shown in Column M and tell us what those contain?

A. The amounts shown in Column M as accrual for Federal income and Federal excess profit taxes for the year 1941 have been computed without regard to special deductions resulting from the refinancing consummated during February but have been adjusted for increase in rates and other changes as a result of the Revenue Act of 1941.

Q. Now, with respect to those special deductions you just mentioned, have you made any computation of those amounts?

A. Yes. Such computations, however, have not been entirely checked with the new Revenue Act because of the newness of it and, subject to that, amount to approximately $900,000.

Q. May I ask, Mr. Watkins, how you, as controller of this company, plan to treat that item and give your reasons?

[fol. 875] A. As controller of the company, it is my expectation to recommend that the company continue to accrue Federal taxes for the year 1941 without referring to the deduction resulting from the refinancing consummated this year but before the end of the year and before the company's books are closed to transfer from the accrued tax account to the unamortized debt discount and expense account the actual amount determined on the basis of the 1941 Revenue Act that does represent the so-called saving as a result of the refinancing and thereby distribute the so-called saving over the life of the securities which gave rise to it.

Q. You believe that that is a proper accounting method for the treatment of this item?

A. I most certainly do.

Q. And it is true, is it not, that this item is a special item resulting in this particular year and not expected in other years and solely coming about by reason of the re-

financing operations which were consummated early in the year, 1941?

A. That is correct, however, there was a similar item in a prior year.

Q. There have been other items of that nature or at least one other item during the history of this company arising also from a refinancing operation?

[fol. 876] A. That is correct.

Q. But unless there were some such refinancing operation, no such particular type of special deduction would result from the normal operations of this company. Is that correct?

A. That is correct.

May the witness make one explanation before we leave this?

Q. Yes, please.

A. The revenues from gas operation shown on line 3 in the various columns of this exhibit do not include the total amount paid by certain of the companies to which Panhandle Eastern sells gas. As a result of certain contracts it has with Michigan Gas Transmission Corporation providing for the acceptance by that corporation and the redelivery by it to certain of Panhandle Eastern's customers, this organization has recorded as income only that part of the amount paid by those customers which it actually received.

Q. Well, do I understand from that, Mr. Watkins, that Michigan Gas Transmission Company receives payment from these corporations which you have mentioned and transmits to Panhandle Eastern Pipe Line Company an amount somewhat less than that, the difference taking care of the contractual obligation with respect to payment for transmission of the gas?

[fol. 877] A. That is correct.

. . . . . .

[fol. 879] Q. What is the item "Interest Charged to Construction" in line 33 which I note is in each instance a red figure?

A. These amounts represent the interest which Panhandle Eastern Pipe Line Company or its subsidiary companies have charged to construction projects and capitalized during the years for which such amounts are shown.

Q. Why, Mr. Watkins, do you start your first column of figures, to wit, Column B, on April 1, 1932, rather than January 1, 1932?

A. The construction of our facilities occurred during the years 1930 and 1931 and continued to about March 31, 1932. The facilities as they then existed were placed in practical operation at that date. Prior to April 1, 1932, all costs were capitalized. However, during a portion of this period the facilities were operated to some minor degree, the result of such operations, either a loss or a gain, was likewise capitalized, so that in effect the entire cost, from whatever source, of the facilities constructed by these companies prior to March 31, 1932, was capitalized.

Q. That fact leads to the result, does it not, that your average figures shown in Column L are for eight and three-quarters years rather than for six or nine years?

A. Yes, that is correct.

Q. And your cumulative total shown in Column K [fol. 880] covers the eight and three-quarters year period, does it not? A. That is correct.

. . . . . .

Q. Will you turn to Schedule 2, which is page 2, Exhibit 49? I note that this page is headed "Net Income Adjusted for Depreciation (Including Amortization) computed at 3 percent for a period from April 1, 1932, to December 31, 1941." May I preliminarily ask you whether it is not true that in line 3 where, under the heading "Item" is shown depreciation per Schedule 1, line 9 that figure "9" should be replaced by "10"?

A. Yes, that is correct.

. . . . . .

[fol. 881] Now, Mr. Watkins, will you state what you have shown on this page, and then will you state how you happen to use a 3 per cent figure in connection with your items contained on line 6 of Schedule 2?

A. This exhibit has been prepared with the view of restating the net income shown on line 35 of Schedule 1 of Exhibit 49 to give effect throughout the years of a provision for depreciation including amortization computed at 3 per cent rather than the basis used by the company per books during those years.

Q. Mr. Watkins, would it be fair to say that the 3 percent item is an approximation of the recent charges made by the company?

A. Not only fair but absolutely correct to so state.

Q. I take it you are not suggesting that this company or any of its subsidiaries were required to set up 3 percent in the earlier years for any reason, are you? A. Oh, no.

Q. You are showing what would have occurred had the [fol. 882] company so handled its records?

A. Simply that.

Q. And what happens to the net income after such an adjustment is made?

A. As to the cumulative total?

Q. Yes.

A. The average?

Q. As to the cumulative total.

A. The cumulative total shown on both Schedule 1 and Schedule 2 representing net income for the period from April 1, 1932, to December 31, 1940, would by this adjustment become $10,070,700.16 rather than $13,552,607.22 as shown on line 35 in Column K on Schedule 1.

Q. Now, will you state what difference such an adjustment would make on the average 1932 to 1940, eight and three-quarters years figures?

A. It would make a difference of approximately $400,000 per year.

Q. On the average? A. On the average.

Q. Thank you. Is there any further explanation that you desire to give with respect to Exhibit 49?

A. There is none.

Mr. Littman: May I ask a question at this point?

Mr. Wheat: Surely.

[fol. 883] Mr. Littman: Mr. Watkins, will you please explain what you include within the meaning of the term "amortization" as used on Schedule 2 of Exhibit 49, that is, in the heading of this schedule?

The Witness: Any provision for the return to a corporation engaged in the exploitation of a wasting asset for its assets consumed in operations must necessarily include factors representing actual deterioration, functional depreciation and the amortization of the corpora-

tion's investment in its facilities over the life of the product which it is exploiting, for which reason it has been the general practice of our corporation to give consideration to and make provision for the possibility that it may become necessary to cease operation before our facilities are actually entirely worn out.

Mr. Littman: Now, what facilities do you mean?

The Witness: All of our facilities.

Mr. Littman: Including the main transmission line?

The Witness: Surely.

Mr. Littman: Thank you.

Trial Examiner: Was it stated in the record what accounting method applied to the reserve for depreciation?

. . . . . .

[fol. 884] The Witness: This matter might better be covered by reference to a registration statement entitled "Registration Statement No. 2-2867 on Securities and Exchange Commission's Form A-1, Effective March 29, 1937, Filed by Panhandle Eastern Pipe Line Company" where on page No. 75 in certain notes accompanying and made a part of the income and surplus statements, included in that statement the following appears:

"The Issuer, under the retirement method of accounting, has provided for current retirements and renewals, and in addition, is providing a reserve for future retirements and renewals. This method does not contemplate a full provision for accrued depreciation as determined by the age and estimated service life of the properties. Annual provisions on the foregoing basis have been computed on the average balance in property account (exclusive of undistributed legal expenditures, interest and taxes during construction, and so forth) at the annual rate of one-half of one per cent for the year 1931, one percent for the year 1932, and one and one-half percent per annum for 1933, 1934 and 1935. In 1936 the provision was computed at the rate of one and one-half percent per annum on the average balance in property account, including undistributed legal expenditures, interest and taxes during

construction, and so forth, on all property exclusive of production system property acquired in liquidation of Texas-Interstate Pipe Line Company on October 31, 1936.

[fol. 885] "Provision for retirements, renewals, depreciation and amortization on this production system property has been computed since acquisition at the rates used by the predecessor subsidiary company, namely, depletion of producing leaseholds at the rate of three mills per m. c. f. of gas produced and amortization of the cost of non-producing leaseholds, drilling costs, well equipment and other production system property at 6 per cent per annum.

"In addition, the Issuer made a provision of $30,108.65 for retirements for the period from September 1, 1930, to December 31, 1930."

By Mr. Wheat:

Q. That is the end of the quotation, is it, Mr. Watkins?

A. That is correct.

Q. Is there any further statement that you desire to read in that connection?

A. In Registration No. 2-4118 of Securities and Exchange Commission Form A-2, effective July 29, 1939, on page S-7 thereof, there is shown a further note with respect to the income account attached to and made a part of the consolidated income account in such statement which reads, in part, as follows:

"The registrant and its subsidiaries have provided for retirements, renewals, depletion and amortization (other than amortization of gas sales and purchase contracts) in [fol. 886] accordance with resolutions of the board of directors. Specific rates based upon the age and estimated life of the properties were not used in determining the amounts.

"The provision made for the year 1936 is not represented to be a reasonable provision for depreciation as determined by the age and estimated service life of the property. The registrant's Certificate of Incorporation, as amended, provides substantially that no dividends on the common stock or any participating dividends on preferred and common stocks may be paid except out of net surplus earned subsequent to December 31, 1935, remain-

ing after there shall have been deducted therefrom as provisions for renewals, retirements, depletion and amortization (other than amortization of gas sales and purchase contracts) an aggregate accrual equal to one-third of one percent per month (on monthly balances) of the consolidated tangible property account of the registrant and its subsidiaries; the provisions for renewals, retirements, depletion and amortization as computed in accordance with the registrant's certificate of incorporation would have amounted to $1,715,241.58, $1,909,966.65, $2,337,597.71 and $979,449.83 for the years 1936, '37 and '38 and the five months ended May 31, 1939, respectively. The amounts claimed by the registrant and its subsidiaries for depreciation for Federal income tax purposes are larger than the provision for retirements and renewals as set forth in [fol. 887] the income account."

That ends the quotation with respect to the matter contained in Registration No. 2-4118.

In Registration 2-4579 on Form A-2 of the Securities and Exchange Commission, effective January 29, 1941, there is a further statement with respect to this matter on page S-7 of which the following is a part:

"The management has been informed by P. McDonald Biddison, an independent consulting engineer of Dallas, Texas, that in his opinion the annual amounts provided for depreciation, depletion and amortization were reasonable for this purpose.

"The provisions for the years 1938, 1939 and 1940 were equal to 2.98 percent, 3.20 percent and 3.16 percent of consolidated property, plant and equipment accounts at the beginning of the respective years."

In a listing application dated February 28, 1941, filed with the New York Stock Exchange with respect to Panhandle Eastern Pipe Line Company's first mortgage and first lien 3 per cent bonds, Series B, due November 1, 1960, under the heading "Depreciation Policy" the following appears:

"The formulae consistently used by the company and its subsidiary companies beginning with the year 1937 to develop an amount to be recommended to the board of di-

rectors as a proper provision for depreciation, depletion [fol. 888] and amortization gives consideration to the "wasting asset" theory and provides depletion on operated leaseholds on the basis of units of gas withdrawn, amortization of investment in unoperated land rights by the use of a composite life of ten years for such land rights, amortization of gas sales and purchase contracts at a specific monthly rate as provided in the company's certificate of incorporation and in amounts to conform to the contract period in certain instances and an amount for the other transmission system properties determined by its board of directors which recognizes amortization in addition to a composite rate based on the age and estimated life of the properties. The propriety of the aggregate annual provision, as well as the reasonableness of the total reserves provided to date has been substantiated by an opinion from an independent consulting engineer. Unless required to do otherwise by some regulatory authority of competent jurisdiction, the company expects to continue this policy."

* * * * * * * * *

[fol. 889] Trial Examiner: Is the straight line method apparently followed by the excerpts you have read?

* * * * * * * *

The Witness: It is followed.

Trial Examiner: It is followed at the present time?

The Witness: That is correct.

Trial Examiner: And when did that begin?

The Witness: We have never used anything else.

Trial Examiner: That is from the beginning?

The Witness: That is right.

Trial Examiner: And your answer to the question originally stated is that you employ the straight-line method of accounting for depreciation?

The Witness: As to the method, that is correct, but as to the amount, that varies over the several years.

Mr. Wheat: But as to the amount, that varies over the several years?

The Witness: Yes, indeed.

* * * * * * * * *

[fol. 890] Q. Mr. Watkins, have you also prepared a document of two pages headed "earned surplus—per books period from commencement of operations to June 30, 1941"? A. I have.

Q. Is the document I now show you the one which I have just mentioned? A. It is.

* * * * * * * * *

(Document No. 50 marked for identification.)

Q. Mr. Watkins, was exhibit 50 for identification prepared by you, or under your direction?

[fol. 891] A. Prepared under my direction.

Q. And does it correctly show what it purports to show, in your opinion? A. It does.

* * * * * * * * *

This exhibit shows an analysis of the earned surplus account per the books of Panhandle Eastern Pipe Line Company and subsidiary companies at December 31, 1930, at each December 31, thereafter up to and including the year 1941, and at June 30, 1941.

* * * * * * * * *

Both the credits during the year, the balance at the beginning of the year, and the total credits thus created are shown on page 1 of exhibit 50.

Q. And are the debits and the earned surplus figures as of the end of the year shown on page 2 of that exhibit?

A. They are.

* * * * * * * * *

Q. Now, will you turn to page 2 of the exhibit.

[fol. 892] What is meant by the items shown on lines 10 and 11 entitled, "Reduction of Interest Capitalized by Amount of Interest earned during 1930" preceding the item on column (C) under the year 1931?

A. That item, which is $18,334.42, as well as the item following the explanation shown on lines 14, 15 and 16, amounting to $53,551.88, shown in column (D), both repre-

sent amounts capitalized by the companies at the end of the construction period and prior to the placing of the facilities—these companies' facilities—in practical operation at March 31, 1932.

* * * * * * * *

Mr. Watkins; have you also prepared a single page computation showing—entitled "Capital Surplus Per Books, Period from September 1, 1930 to June 30, 1941"?

Such an exhibit has been prepared under my direct supervision.

Q. And is the document I now show you the exhibit you have just mentioned? A. It is.

* * * * * * * *

[fol. 893] (Document referred to was marked Exhibit 51 for identification.)

Q. Does Exhibit 51 for identification correctly show what it purports to show, in your opinion, Mr. Watkins?

A. It does.

Q. Let me ask you in respect to the item covered under lines 11, 12 and 13, which same amount appears opposite lines 22 and 23.

What does that item represent and what brought about the reduction shown in the balance at the end of the year for 1931 in column (C) under the balance shown in column (B) which is the period September 1, 1930 to December 31, 1930?

If there is some action on the part of the Board of Directors of the Company you would like to read in connection with that, please feel free to do so.

A. If the witness may suggest, it might be more appropriate to explain that item in connection with the next exhibit.

Q. I would be very happy to have you do so. The next exhibit is the exhibit entitled, "Gas Plant"?

A. That is correct.

Q. We will proceed in that manner, then, and ask for that explanation at that time.

[fol. 894] I would like to ask you, however, on exhibit 51, to explain the items in column (H) and state what happened with respect to capital surplus between the close of the year 1935, shown in column (G), and the close of the year 1936, shown in column (H)?

A. As will be shown by ines 3, 4 and 5 in column (B), Panhandle Eastern Pipe Line Company came into possession of surplus aggregating $19,335,867.47, as of August 31, 1930, without cost to it.

In the year 1936, the items to which your question was directed, representing a residue of $19,000,000 odd the witness referred to, were disposed of by action of the Board of Directors, through the creating of special reserves in that year applicable to the earned surplus deficit of the company at December 31, 1935, amounting to $1,247,365.50, and a special reserve to cover the loss on investments in subsidiary companies, in two subsidiary companies as of December 31, 1935, amounting to $2,232,009.04.

There was also assigned to the common stock account $15,017,300 so that the entire number of shares of common stock outstanding at that time would be deemed to have been issued at $25.00 a share.

These appropriations, together with a charge to capital surplus of $39,902.48 representing an account due from Missouri-Kansas Pipe Line Company written off during [fol. 895] the year 1933, disposed of $18,000,000—

Q. (Interposing) You mean 1936, do you not?

A. Correct, disposed of 18,536,577.02 of the remaining capital surplus of $19,335,867.47 created on August 31, 1941, as previously explained.

Q. You mean 1931? A. I am sorry, 1936.

Q. Now, Mr. Watkins, that left, at the close of 1936 as capital surplus on the books of the company, the item of $46,364.54, did it not? A. That is correct.

Q. I note that item does not appear, nor any other appears as capital surplus per books as from January 1 to June 30, 1941. Will you state what happened to the $46,000 odd item which I just mentioned?

A. During the year 1939, the item amounting to $46,364.54 was transferred to the reserve for depreciation

in conformity with the authorization by the company's board of directors.

* * * * * * * *

Q. Now, have you, Mr. Watkins, a statement consisting of two pages headed, "Gas Plant"?

A. Such a statement has been prepared under my direction.

* * * * * * * *

[fol. 896] (Document marked exhibit 52 for identification.)

Q. And does exhibit 52 for identification, in your opinion, correctly state what it purports to show?

A. It does.

Q. Will you now explain exhibit No. 52, the items which I mentioned to you in my interrogation under exhibit 51 which you stated you thought had better be explained under this item?

A. By reference to page 2 of exhibit 52, particularly in columns (b) and (c) on line 40, it will be noted that the balance in the account under the classification, "Gas Sales and Purchase Contracts" in those years is considerably greater than that under the same caption on line 40 in column (d).

Q. For 1932?

A. For the year 1932. The reason for this change came about in this manner:

At a special meeting of the Board of Directors of Panhandle Eastern Pipe Line Company held on September [fol. 897] 3rd, 1930, the following preambles and resolutions were adopted and I quote:

"Whereas, Messrs. Brokaw, Dixon, Garner and McKee, geologists and petroleum engineers, have given to this Company a letter setting forth their opinion that this company's present and available sales contracts are of a present fair market value in excess of eleven million ($11,000,000) dollars, which letter is in substance as follows:

"'Based on our examination of the leaseholds for natural gas acreage, survey of the natural gas transmission line now under construction from the Panhandle area of Texas, Oklahoma, and Kansas to Indiana, survey of the

markets of the present non-competitive territory to be served by this line, analysis of the contracts signed and under negotiation for gas and of contracts available, we are of the opinion that such present and available sales contracts are of a present fair market value in excess of $11,000,000.'

"Now, Therefore, be it

"Resolved that the officers of the company be, and are hereby authorized, empowered, and directed to set up the company's present and available sales contracts upon its books at a value of Eleven Million ($11,000,000) Dollars."

As a result of that action by the Board of Directors, an entry was made on the books of Panhandle Eastern Pipe Line Company represented by Journal voucher No. [fol. 898] J-11 during the month of September, 1930, a result of which was a charge to a sub-classification, "Gas Sales and Purchase Contracts", in the property plant and equipment account of $10,357,713.70, and a corresponding credit to the account, "Surplus Arising from Valuation of Gas Contracts".

This $10,357,713.70 taken together with an amount previously appearing on the company's books of $642,286.30, represented the $11,000,000 authorized by the Board of Directors in preambles and resolutions quoted from the meeting of the board held on September 3, 1930.

At a meeting of the Board of Directors of Panhandle Eastern Pipe Line Company held on March 29, 1932, the following preambles and resolutions were adopted.

"Whereas the Board of Directors of Panhandle Eastern Pipe Line Company, at its meeting held September 3, 1930, pursuant to an appraisal by Brokaw, Dixon, Garner and McKee, adopted a resolution determining the value of the gas sales and purchase contracts owned by this Company to be $11,000,000 and ordered the value of said contracts to be so entered on the books of account of the company;

"Whereas, pursuant to said resolution, an entry was made on the books of account of the Company charging 'Gas Sales and Purchase Contracts' and crediting 'Surplus Valuation of Gas Contracts' with the sum of $10,357,713.70; and

[fol. 899] "Whereas, in the opinion of this Board, it is desirable to reverse said entry in order that the books of account of this Company shall be as fully as possible in accord with sound and conservative accounting practice;

"Now, Therefore, be it Resolved that the Treasurer of the Panhandle Eastern Pipe Line Company be and hereby is directed to enter on the books of account of the Company a credit of $10,357,713.70 to the account entitled 'Gas Sales and Purchase Contracts' and a debit in the same amount to the account entitled 'Surplus-Valuation of Gas Contracts'; and

"Resolved that the Treasurer of said Company be and hereby is directed to investigate and report to this Board his recommendations with respect to the balance remaining in said account 'Gas Sales and Purchase Contracts' after the entry of the credit hereinabove ordered."

As a result of this action by the board of directors, journal entry No. C-517 made in the month of March, 1932, charged account No. 191, "Capital Surplus Arising From Valuation of Gas Contracts", and credited Account No. 3, "Gas Sales and Purchase Contracts", with the amount of $10,357,713.70, so that the explanations of the amount just quoted appearing on both lines, 12, and on 23 of exhibit No. 51, as well as the reduction in the classification on page 2 of exhibit No. 52 on line 40 in the year 1932, column (d) came about.

* * * * * * * * *

[fol. 900] By Mr. Wheat:

Q. All right.

What is meant by the terms "drilled" and "not drilled" in lines 10 and 12?

A. The amounts shown in columns (B) to (M) exclusive on exhibit 52, in lines 10 and 12, represent the cost per the company's books of its gas leaseholds, segregated as to those leaseholds upon which there are wells drilled, or by virtue of conservation orders or practices followed by the companies, have been combined into production units as well as the cost per the company's records of such leaseholds upon which there are no wells

drilled and as to which none have been included in conservation or drilling units.

* * * * * * * *

[fol. 902] Q. Now, will you turn to page 2 of exhibit 52, and tell us whether it is a fact that the undistributed construction expenditures shown under lines 24 to 35 of that page, were distributed during the year, 1937 to the respective accounts to which they might apply?

A. They were.

* * * * * * * *

[fol. 903] Q. Yes.

Will you direct your attention to lines 43 and 44 of page 2, headed, "Other gas sales and purchase contracts": Of the items which are represented under that heading, have they any relation to the items of "Gas Sales and Purchase Contracts" covered under line 40?

A. The amounts shown on lines 42, in columns (D) to (M) inclusive, on this page, represent at the end of each respective year, the accumulated balance in an account created for amortization of the amount shown on line 40 of this same exhibit.

The amounts shown on line 44 in columns (H) to (M), inclusive of this exhibit, have no relation whatever to the amounts stated either on lines 40 or 42.

* * * * * * * *

[fol. 904] Mr. Watkins, referring to page 1 of exhibit 52, where are the field lines, or gathering lines included on that page? I do not see them listed there and I wondered where you included them.

The Witness: Prior to the advent of the Uniform System of Accounts adopted by this Commission, neither Panhandle Eastern Pipe Line Company, nor any of its subsidiaries considered that they had investments in field lines.

Our lines are of such size that for operating and internal use, they seem to be transporting gas directly from the well mouth to the customer.

Our work of reclassification of accounts to conform to the uniform system of accounts has not yet been com-

pleted, so that it remains for us to make a separation of some sort.

Mr. Littman: I take it from your answer that the field lines and the gathering lines will probably be included under the heading of "mains" shown in line 37 on page 1 of exhibit 52?

The Witness: That is correct.

Mr. Littman: And the rights-of-way would probably be included in line 31, "land"—I mean 32, "land rights".

[fol. 905] The Witness: In the separation, that is also required.

Mr. Littman: Rather than in the production plant accounts?

The Witness: That is correct.

Mr. Littman: Referring to page 2, Mr. Watkins, I note that with respect to undistributed construction expenditures, to-wit:

"Engineering and Superintendence during Construction",

"Law Expenditures During Construction",

"Interest During Construction",

"Taxes During Construction", and

"Miscellaneous Construction Expenses — Expenditures" shown in lines 26 to 35, inclusive, on page 2 of exhibit 52, I note that there are no figures shown for the years 1937, 1938, 1939, 1940 or 1941.

Will you please explain how that comes about?

The Witness: In the years 1937, 1938, 1939, and 1940 to the extent there were any such costs, they were distributed directly to the respective work on which such cost was incurred.

Mr. Littman: In other words, you don't mean to infer there was none incurred, but they were not separately shown on the books as in previous years; is that right?

The Witness: That is correct.

Mr. Littman: In other words, whatever was incurred in that respect, that is, through 1937 and thereafter, was distributed among the various accounts?

[fol. 906] The Witness: In those years.

Mr. Littman: And the balances in 1936 were so distributed?

The Witness: There was a general distribution made in the year 1937 of the balances of these amounts accumulated up to that time.

Subsequent to that distribution, any such cost incurred was distributed customarily in the year in which it was incurred if it was not distributed directly to the job as the work was performed.

* * * * * * * * *

Q. Now, Mr. Watkins, have you also prepared a statement consisting of two pages, entitled, "Statement of Dividends, Paid on Class 'A' and Class 'B' Preferred Stocks from Beginning to September 1, 1941"?

A. Such a statement has been prepared under my supervision.

* * * * * * * * *

[fol. 907] (Document Referred To Marked Exhibit No. 53 For Identification.)

Q. Mr. Watkins, does Exhibit No. 53 for identification correctly purport to show what is your opinion?

A. In my opinion, it does.

Q. And what is the source of the data, the books of the company?

A. That is correct.

Q. Without asking many questions about this exhibit, let me just ask you whether this participation shown in connection with the dividends under column (D) involves both the common and preferred stocks?

A. As to this particular exhibit, it involves only the participation on the class A preferred stock. There will be a further exhibit showing the amount of such participation on the common stock, but it does include participation in both classes.

Q. How are these participations based?

A. When in any year dividends at the stipulated rate have been paid on the company's preferred stocks and dividends aggregating $1.50 per share have been paid on the common stock, this company's common stock and class [fol. 908] "A" preferred stock participate in further dividends in that year on the basis of 25 percent of such dividends to the Class "A" preferred stock.

Trial Examiner: From your exhibit 48, it appears you had no preferred stock prior to 1936.

By Mr. Wheat:

Q. May I ask the witness the history of the preferred stock of this company?

A. As shown by page 2 of exhibit 42, on line 3, in column 8, the preferred stock to which reference has just been made, came into existence in the year 1936.

Trial Examiner: You said exhibit 42. I believe you meant exhibit 48, did you not?

The Witness: That is correct. The witness believes there was a slight amount of preferred stock in the very early history of the company, but has no specific information at this time with respect to the details of that stock.

By Mr. Wheat:

Q. Then, the answer to the Examiner's question is that the preferred stock which is mentioned on your exhibit No. 53, and which is now outstanding, is stock which came into existence during the year 1936?

A. That is correct.

[fol. 909] Trial Examiner: So that your phrase used on the proposed exhibit 53, "from beginning to September 1941" should be modified to state, "from 1936 and thereafter"?

Mr. Wheat: Yes, I think that understanding may be had.

* * * * * * * *

Q. Have you also prepared a single page statement entitled, "Statement of dividends paid on Common Stock from Beginning to September 1, 1941"?

A. Such a statement has been prepared under my supervision.

. . . . . .

[fol. 910] Q. And does it, in your opinion, correctly show what it purports to show?

A. It does.

. . . . . .

(Document Referred To Was Marked Exhibit No. 54 For Identification.)

Q. Mr. Watkins, the explanation you have already made with respect to participating dividends as between common and Class "A" Preferred Stockholders explains the items under participating on exhibit 54, does it not?

A. In column (C).

Q. Let me ask you what is meant by note—(1) in line 17 to line 21 on exhibit No. 54.

A. If the witness' memory is correct, during the early part of this year, the company had a registration statement pending with the Securities and Exchange Commission in connection with which some question arose as to whether or not by reason of the ownership of Central Distributing Company, a wholly-owned subsidiary, which company distributed natural gas in the States of Missouri and Kansas, complications with respect to whether or not the [fol. 911] company was a gas utility under purview of the Natural Gas Act might arise.

In order to clear the slate of any such complications or possibility, the capital stock of the subsidiary was increased so that it represented an equal number of shares of stock as there were outstanding of Panhandle Eastern Pipe Line Company's common stock and the Board of Directors declared a dividend payable in shares of this subsidiary on the basis of one share of the subsidiary stock for each share of Panhandle Eastern Common Stock so held.

As a result of this declaration, the concurrent charge to "Earned Surplus" of $399,094.14 was made.

This amount represented the net asset-value of subsidiaries according to its own books.

. . . . . .

Q. Mr. Watkins, you said something about the Natural Gas Act in your previous answer—you meant the Holding Company Act, did you not?

A. Certainly.

Q. Thank you.

Now, Mr. Watkins, have you also prepared a statement consisting of a single lengthy page entitled "Statement [fol. 912] Showing Comparison of Sales and Revenue, Principal Industrial Customers, Years 1939, 1940 and 1941"?

A. Such a statement has been prepared under my supervision,

Q. Does the document I now show you, is that the statement to which you just referred?

A. It is.

Q. Does it, in your opinion correctly show what it purports to show?

A. It does.

. . . . . .

(Document Referred To Was Marked Exhibit No. 55 For Identification.)

Q. Mr. Watkins, in connection with exhibit 55 for identification, how did you select or have selected the various customers listed in column (A)?

A. The customers included in column (A) are the customers whose annual purchases from Panhandle Eastern Pipe Line Company, or its wholly owned subsidiary, Illinois Natural Gas Company, or from the organization to whom Panhandle Eastern Pipe Line sold gas for resale to such organization—

[fol. 913] Q. You mean to such customers?

A. To such customers, in excess of $20,000 per annum.

You will note that in column (C) most of the customers are indirect customers which accounts for their having been included in this schedule.

Q. I note that you have here data for 1941, the totals shown for 1941 are the totals of the columns covering 6 months' actual and 6 months' estimated, are they not?

A. That is correct.

Q. I note that in the last column, a rather large increase in both revenue and MCF sales is shown for the year 1941 over the year 1939.

Would you say that any large proportion of that increase is probably due to defense operations?

A. It would be the witness' judgment that the entire amount, or possibly more would be directly due to defense operations.

Q. How do you reach that conclusion?

. . . . . .

A. As the witness previously stated, the customers included in this exhibit are those whose annual purchases are in excess of $20,000 per customer.

[fol. 914] Unquestionably, out of the great number of other customers both direct and indirect, much of their purchases were a direct result of the defense activity.

Furthermore, it will be noted that in columns (O) and (Q) there are several amounts which represent decreases rather than increases.

That would have a tendency to increase the $892,000 figure shown in column (Q) on line 40.

. . . . . .

Q. I believe it is self-explanatory.

Now, Mr. Watkins, have you also prepared a statement, a one-page document headed, "Statement of Gas Produced From April 1, 1932 to June 30, 1941"?

A. Such a statement has been prepared under my supervision.

Q. And is the document I now show you the one to which you have just referred?

A. It is.

Q. Does it correctly show what it purports to show in your opinion?

A. It is my opinion that it does.

. . . . . .

[fol. 915] (Document Marked Exhibit No. 56 For Identification.)

Q. Now, Mr. Watkins, referring to Exhibit 56 for identification, the data which you have included on this exhibit is from the companies' records, is it not?

A. It is.

Q. And why did you use only three-quarters of a year in 1932?

For the same reasons as you have explained on another exhibit?

A. That is correct.

Q. The items covered under column (D) include the so-called "Local Area", is that correct?

A. Yes, sir.

Q. Is there anything else you feel should be explained with reference to exhibit 56?

A. Column (B) is headed Amarillo field. Really that refers to the Panhandle field.

Q. Yes.

I think wherever that might appear in this exhibit, and in the next exhibit which I will show you, it may be understood that refers to the Panhandle field of Texas?

A. That is correct.

* * * * * * * * *

[fol. 916] Q. Have you also prepared a document, 1-page document, entitled "Statement of Gas Purchased, Period from April 1, 1932 to June 30, 1941"?

A. I have.

Q. Is the document I now show you the one you just referred to?

A. It is.

Q. And does it correctly show what it purports to show?

A. It does, in my opinion.

* * * * * * * * *

(Document Marked Exhibit No. 57 For Identification.)

* * * * * * * * *

[fol. 917] Q. The data shown on exhibit No. 57 was obtained from the companies' records, was it not?

A. It was obtained from the companies' records under my supervision.

. . . . . .

Q. Have you also prepared, Mr. Watkins, a document of several pages, entitled, "Statement of Gas Revenue Period from April 1, 1932 to June 30, 1941"?

A. Such a statement has been prepared under my supervision.

Q. And is the document which I show you the document to which you have just referred?

A. It is.

Q. Does it, in your opinion, correctly show what it purports to show?

A. It does.

. . . . . .

(Document Marked Exhibit No. 58 For Identification.)

[fol. 918] Q. Mr. Watkins, does schedule 2 of Exhibit 58, which appears on the second and third pages of the exhibit, constitute a detail of sales to gas utilities during the years 1939 and 1940?

A. It does.

Q. Let me ask you in that connection with respect to the item contained on page 2 of schedule 2 in column (H), line 7, is the figure shown, the net figure received by Panhandle Eastern Pipe Line Company?

A. It is.

Q. Now, Mr. Watkins, are the last two pages of this exhibit which are headed, "Schedule 3", pages 1 and 2, a detail of sales to industrial consumers?

A. For the years 1939 and 1940.

Q. And are—

A. Such a statement for the direct industrial consumers of Panhandle Eastern or Illinois Natural.

It does not include any indirect industrial sales.

Q. In other words, the industrial sales shown on schedule 3 of exhibit 58 are all the direct industrial sales made by this company and are all direct industrial sales; is that correct?

A. That is true; not only with respect to industrial [fol. 919] sales, but residential and commercial sales shown on the same page of that exhibit.

* * * * * * * *

Q. I was speaking of schedule 3 of exhibit 58 when I mentioned particularly this question as to whether or not schedule 3 shows the sales to all of the companies' direct industrial consumers; and whether all of the sales are direct sales?

A. They are.

* * * * * * * *

Q. In exhibit 58, you have included all the industrial customers, have you not, without regard to their annual bill—direct industrial customers without regard to their annual bill?

A. That is correct.

Q. Now, turning to schedule 1, which is page 1 of exhibit 58, is it a fact that all of the sales, both residential, commercial and industrial, and sales to gas utilities included [fol. 920] on that page are direct sales by Panhandle Eastern or its wholly owned subsidiary?

A. With the explanation heretofore made by this witness with respect to sales to certain customers to whom gas is transported by Michigan Gas Transmission Corporation, that is correct.

Q. Yes.

Now, the residential and commercial direct sales are down to very small amounts in the current year, are they not? A. They are.

Q. Your direct industrial sales, however, have risen materially? A. They have.

Q. And the same is true, is it not, with respect to sales to gas utilities?

A. That is right.

* * * * * * * *

Mr. Littman: May I ask a question here?

Mr. Watkins, you do not show in exhibits 55 or 58 the pressure base that you used for the quantities of gas there-

in shown, whereas, you do show a pressure base in exhibits 56 and 57 at 16.4 pounds absolute pressure.

[fol. 921] Can you state what the pressure base was that you used in exhibits 55 and 58?

The Witness: The pressure base at which the sales were made. It varies, of course.

* * * * * * * *

By Mr. Wheat:

Q. You do sell some gas on a therm basis; is that correct? A. That is correct.

Q. Now, Mr. Watkins, have you also prepared a one-page document entitled "Statement of Gas Revenue by States Period from April 1, 1932 to December 31, 1941"?

A. Such a statement has been prepared under my direct supervision.

Q. The document I now show you is the document to which you have just referred?

[fol. 922] A. It is.

Q. Does this document, in your estimation, correctly purport what it purports to show? A. It does.

* * * * * * * *

(Document Referred to Was Marked Exhibit No. 59 for Identification.)

Q. Mr. Watkins, I think Exhibit 59 for identification is self-explanatory, but I should like to ask you whether you have with you data from which you could state the annual amount of industrial sales during 1933, 1936 and 1940 in Missouri, Illinois and Indiana, respectively?

If so, I would appreciate it if you would read those data into the record.

* * * * * * * *

A. No, I don't have such information available.

Q. What data have you with you with respect to details of sales shown or revenues shown on exhibit 59?

A. The three states involved were?

Q. Missouri, Illinois and Indiana.

[fol. 923] A. I can furnish the industrial sales for the states of Missouri and Illinois for the years 1939 and 1940 only.

Q. Will you state those amounts, please.

A. Direct industrial sales made by Panhandle Eastern Pipe Line Company in the State of Missouri during the year 1939, amounted to $550,326.93.

In the year 1940, $619,442.49.

Q. Will you give us now, Illinois?

A. The industrial sales made in the State of Illinois in those two years were respectively $25,411.30, and $22,844.20.

* * * * * * * * *

Q. Thank you.

Now, Mr. Watkins, have you prepared any statement in a tabulated form, or otherwise, showing the original cost of properties of Panhandle Eastern Pipe Line Company?

A. No, I haven't been able to do that at this time.

Q. Would you like to explain the situation with respect to that item?

A. On November 3, 1939 the Federal Power Commission issued its order No. 49, prescribing a system of accounts for the Natural Gas Companies under the Natural Gas Act. Sometime prior to that date, however, Panhandle Eastern and its subsidiary companies had been giv-[fol. 924] ing consideration to a study that might become necessary in order to develop a statement of the gas plant of its companies based on original cost under the Commission's definition for such plant, which we generally understood at that time to be the cost of gas plant to the persons first devoting the property in question to public service.

Q. Mr. Watkins, did the order No. 49, which you have just mentioned, contain a provision in respect to this matter?

A. It did. In Instruction No. 2 of such order, provision was made for preparation of a statement of original cost.

Q. And what has Panhandle Eastern Pipe Line Corporation done in that connection?

A. Immediately upon receipt of the formal order of the Uniform Classification of Accounts prescribed by the Federal Power Commission, our consideration of the problem and our work on it took definite form through the creation of a separate section of the company's general accounting department, manned by employees, specially

equipped to undertake and satisfactorily finish the transition of the companies' records from the accounting practices previously employed to those required under the Commission's Classification of Accounts.

Q. What further steps have been taken in that connection?

A. Well, the work thus undertaken was scheduled to provide in a satisfactory manner for the filing of the data [fol. 925] required by an order of the Commission dated April 9, 1941, which was order No. 73, and which provided in detail for the filing of so-called original cost data.

The effort was made for the completion of this study and a filing of the results of this study during the month of November of this year; this being shortly before the time fixed for such filing in the order.

* * * * * * * * *

Q. Will you please state for the record what the present status of this work is?

A. The advent of a tremendous volume of effort thrust upon the general accounting department as a result of the inception of these proceedings has thrown this company's time schedule, in connection with its original cost studies very much awry.

Since the early part of July of the current year, 1941, the time of the entire accounting staff, including those who had been engaged in the reclassification work, has been necessarily devoted almost exclusively to the preparation of material for use in connection with Federal Power Commission Docket G-200 and G-207.

[fol. 926] Q. Are we to understand that it is not possible for you to present at this time, such a re-classification, showing the original cost of the company's properties in the manner set forth in the Commission's order?

A. That is correct.

However, I should like to make a further statement in respect to that matter.

Q. Please proceed.

A. It is my opinion, based upon my experience with this company, and also my knowledge of the way in which its books have been developed, that when it becomes pos-

sible to make the filing required by the Commission, order No. 73, there will be very little, if any, difference between the investment of the company in properties as shown by its books, prior to the adoption of the Commission's Uniform System of Accounts, and the amounts to be reported as original cost.

* * * * * * * * *

I hold such opinion because practically all of the facilities used by Panhandle Eastern and its subsidiary companies were constructed by those companies and were first devoted by them to public service.

Furthermore, in respect to the small amount of property which was not so constructed and devoted to public service by this company, such property was acquired without [fol. 927] cost to those companies, and according to the best information we have thus far been able to obtain, was first devoted to public service by the organization from which these companies received the properties at no cost.

Q. Thank you.

Now, Mr. Watkins, one further document.

Have you prepared a document of a number of pages, I think 8 pages, headed, "Sales Agreements with Other Gas Companies as at June 30, 1941"?

A. Such a statement has been prepared under my supervision.

Q. And is the document which I now show you the one which you have just referred to? A. It is.

Q. Does it, in your opinion, correctly show what it purports to show? A. It is my opinion that it does.

* * * * * * * * *

Trial Examiner: It will be so marked.

(The Document Referred To Was Marked Exhibit No. 60 For Identification.)

Q. Mr. Watkins, briefly what does exhibit 60 show?

[fol. 928] A. Exhibit 60 contains a tabulation of the sales agreements of Panhandle Eastern Pipe Line Company and Illinois Natural Gas Company with other Gas Companies as at June 20, 1941.

I mean, June 30, 1941. The information included in this exhibit gives the name of the customer, the territory served, some segregation of the nature of the service, the date of the agreement, or Federal Power Commission rate schedule under which service is rendered, and the expiration or term of either the agreement or rate schedule involved.

Q. And is it a fact that this exhibit shows both the firm and non-firm service in respect, first, to the sales agreements with other gas companies, and also with respect to the sales agreements with industrial customers?

A. That is correct.

Q. Are all of the sales agreements with industrial customers of an interruptable character?

A. They are, and with respect to that, certain of the agreements covering non-firm service have interruptable features.

Q. Yes.

Now, let me ask you, the pages 6, 7 and 8 of this exhibit deal with contracts of Illinois Natural Gas Company, do they not?

A. They do.

Q. The previous pages deal with contracts of Panhandle [fol. 929] Eastern Pipe Line Company, do they not?

A. In both instances, contracts or rate schedules; that is correct.

* * * * * * * *

[fol. 931] Q. Mr. Watkins, one or two more questions. Are there any sinking fund requirements prescribed in any of the documents or indentures under which Panhandle Eastern Pipe Line Company's bonds or notes have been issued?

A. There are sinking fund requirements in the indenture dated November 1, 1940 between Panhandle Eastern Pipe Line Company and Chemical Bank & Trust Company and in the mortgage and deed of trust dated November 1, 1940 between Panhandle Eastern Pipe Line Company and City Bank Farmers Trust Company and James M. Kemper, trustees.

As to the sinking fund provisions of the note indenture there is provision for the retirement of the $5,000,000 prin-

cipal amount of serial notes in equal annual installments of $1,250,000 on each November 1, 1942 to 1945 and the provisions in this respect are included in Section 1 of Article I of page 11 thereof.

The mortgage and deed of trust referred to contains sinking fund provisions with regard to an issue of Series [fol. 932] A bonds and Series B bonds. The Series A bonds, by the terms of the mortgage indenture are to be retired in equal annual installments of $1,250,000 on each November 1, 1946 to 1950, inclusive, and their precise terms are shown in Section 1 of Article IV on pages 209 and 210 of that indenture.

The mortgage indenture also contains provisions for the retirement of the Series B bonds in accordance with the sinking fund provisions stated in Section 9 of Article IV on page 239 of the mortgage and deed of trust on the basis of $1,200,000 each November 1, 1951 through 1960, inclusive.

Q. That is $1,200,000 each year?

A. That is correct.

Q. Is that, in general, a statement of the various sinking fund requirements that are prescribed in the documents mentioned? A. It is.

* * * * * * * *

[fol. 933] DAVID FRIDAY, called as a witness on behalf of Panhandle Eastern Pipe Line Company, being first duly sworn, was examined and testified as follows:

Direct Examination.

By Mr. Wheat:

* * * * * * * *

Q. And where do you reside?

A. I reside at 4525 Garfield Street, Washington, D. C.

* * * * * * * *

I was graduated from the University of Michigan in 1908 [fol. 934] and appointed an instructor there in economics and began the teaching of economics and finance there in the autumn of that year. I was there as an instructor

until 1912 when I was made associate professor of economics and accounting and then taught economics and accounting, also public financing from 1912 to 1916. I was made a full professor in 1913.

In 1916 I left the University of Michigan and went to New York University, School of Accounts and Finance, where I had charge of the graduate courses in value and valuation, the subject of price and also courses in public finance.

I became head of the Department of Economics at New York University in the autumn of '17 and left there in the spring of '18, temporarily, on leave of absence at first, to come to the United States Treasury in April of 1918.

There my task was the planning of a system of war taxes, those taxes were largely enacted into law by Congress at the beginning of 1919.

I remained at the United States Treasury until September 1918. At that time I went to the Post Office Department under Post Master General Burleson, who was at that time in charge of the Government control and operation of the telegaph and telephone systems of the country.

My task there was one of doing the statistical investigations and the economic examination incident to award-[fol. 935] ing those companies just compensation for the use of their property as the law provided. I was there until September 1919.

When I returned to the University of Michigan I taught courses in money, credit and business cycle. I was there until 1921.

In 1921 I became president of the Michigan Agricultural College, now known as the Michigan State College, and I was there until 1923.

From 1923 to 1924 I was in Washington as Director of Research of the National Transportation Institute. Also, while I was at Washington, I lectured in public finance and the subject of value and prices at the Brookings Graduate School for Economics.

In 1925 I went to Europe and studied situations there. After that I was not engaged in strict academic work.

I also taught economics, incidentally, at Columbia University in the summer of 1920 and lectured at various places. I lectured at Harvard on the subject of value and depreciation.

Q. Dr. Friday, during your years of professional experience which you have detailed to us, had you even then commenced some work of a consulting character in connection with economic problems?

A. Yes, sir. In 1909 I worked with Professor Henry [fol. 936] Carter Adams who was at that time statistician of the Interstate Commerce Commission, as well as head of the Department of Economics at the University of Michigan, on the valuation of the franchises of the Detroit United Railway. That was a task that we did for the City of Detroit.

In 1911 I was in charge of statistics for the Michigan Commission of Inquiry into Taxation, a special Commission appointed by the Legislature. I had charge of that in the summer and autumn of 1911.

In 1912 I was employed by the Attorney General of the State of Michigan to work on a 2-cent passenger rate case, involving the rates on the Duluth, South Shore and Atlantic Railroad, a railroad in the upper peninsula of Michigan.

In 1913 I was retained by the minority stockholders of the Lake Shore & Michigan Southern Railroad, that is now the New York Central Railroad west of Buffalo into Chicago, to determine the fair value of the minority stock of the Lake Shore & Michigan Southern, the New York Central & Hudson River Railroad Company being owner of the majority of the stock.

In 1914 I was employed by the Railroad Commission of Michigan to rewrite the property accounts of the Pere Marquette Railroad then in reorganization, also to value the lands of the station grounds and the right-of-way of the Pere Marquette Railroad.

In 1915 I wrote a corporate history for the Michigan [fol. 937] Railroad Commission,—I believe it was called the

Public Utility Commission by that time, I am not quite clear,—of the Consumers Power Company and to determine the going value of that company for the Commission.

Q. Have you done any work in California?

A. In 1915, after I had finished this work with the Utilities Commission, I went to the City of Los Angeles to determine the value of the franchises of the Southern California Edison Company which were at that time being condemned by the City of Los Angeles in the acquisition of a municipality owned electrical property.

In 1916 I was engaged in an income bond case involving the income of the income bonds of Texas Pacific Railroad; that was a court case.

I was also retained by the bond holders of the Texas and Oklahoma and the Sherman, Shreveport, and Southern Railroads, those were two branches of the Missouri, Kansas and Texas, which was then in receivership, and negotiated the sale of the Sherman, Shreveport and Southern Railroad to the New Orleans interest that finally acquired that.

In 1917, while I was in New York at New York University, I was engaged in various matters involving valuation and reorganization and litigation.

In 1927 after I had been in Europe and was largely engaged there for several years, I was engaged by the [fol. 938] minority stockholders of the Ford Motor Company who had sold their Ford Motor stock to Mr. Ford in 1919. There the task was to determine the value of the stock of the Ford Motor Company as of March 1, 1913. That resulted in testifying before the United States Board of Tax Appeals in the determination of that value.

From then on I was in various matters involving valuation, particularly of securities. Some of those cases that I have been in recent years were a valuation of the common stock of the Curtis Publishing Company of Philadelphia. The occasion for that was the determination of the fair value of that stock for purposes of determining the estate tax of Mr. Edward Bok who had been editor of the Ladies Home Journal and who had died.

I testified before the Board of Tax Appeals in 1936 in that matter.

I testified for the United States Government, either '37 or '38, I believe it was '37, in the determination of the value of the stock of the Hoover Vacuum Cleaner Company stock which had no market value and never was marketed. In that case I testified before the Board of Tax Appeals for the United States Government.

In 1938 I was retained by the Laird Estate to determine the value of the common stock of the Christiana Securities Company, popularly known as the DuPont family holding [fol. 939] company. That was before the Board of Tax Appeals and that case was heard early in 1938.

. . . . . .

Q. Have you been connected with the National Bureau [fol. 940] of Economic Research?

A. Yes, I have been connected with the National Bureau of Economic Research from very shortly after its origin. I may say that that is a non-profit organization located in New York City. It was organized about 1918 or '19 and it was devoted to pure research. I have been a Director in it almost from its inception and in the years '38 and '39 I was president of the Bureau and I am now Chairman of the Board of the Bureau.

. . . . . .

Q. Did you engage in any activity from an economic viewpoint during the period of the N. R. A.?

A. Yes, during the period of the N. R. A. I acted as economist for the National Retail Dry Goods Association as economist in connection with the preparation of the economic information and statistics incident to the obtaining of the retail code for dry goods and boots and shoes and [fol. 941] hardware and several other retail lines.

I was also the economist for the Retail Tobacco Dealers' Association. That was one which involved an analysis particularly of unfair competition and one, by the way, which had a marketing agreement during the code days.

Q. Yes. Have you published any books in connection with your studies and your work?

A. I prepared a book of readings in economics, but I wrote and published a book of "Problems in Accounting" while I was at the University of Michigan and I published in 1920 a book entitled "Profits, Wages and Prices," published by Harcourt, Brace & Company.

I have published a good many magazine articles in the various economic journals, that is, the Journal of Political Economy at the University of Chicago, the American Economic Review, which is the official publication of the American Economic Association; Quarterly Journal of Economics, which is the Harvard publication, on such various subjects, particularly taxation, valuation and such. I have also written a good many articles in the more popular magazines, Atlantic Monthly, Review of Reviews, World's Work, Saturday Evening Post and the New Republic. I was contributing editor of the New Republic for four years.

Q. Dr. Friday, have you prepared a statement of statistical material and descriptive material entitled "Cur-
[fol. 942] rent and Future Trends in Commodity Prices and Wages," with particular reference to the pending procedure. Have you prepared such a study?

A. I have.

Q. Is the document which I now show you the study to which you refer? A. Yes, it is.

Q. Was this prepared by you or under your direction except insofar as there are public documents and public statistics included in it? A. It was.

Q. Yes. And does it, in your opinion, correctly show what it purports to show?

A. It does, yes, sir.

. . . . . .

(Document Referred To Was Marked Exhibit No. 61 For Identification.)

. . . . . .

[fol. 943] Q. Now, Dr. Friday, referring to Exhibit 61 for identification, I wish you would turn to the first page and briefly outline what you did and what your conclusions have been with respect to the price situation.

A. Well, I studied the price situation as it existed. This study was begun, specifically this particular study—

I have always been interested in the subject of prices during the last war and during this one and the intermediate period, but I studied the whole movement of prices as it has been going on in this country since the war broke out, and particularly since the earlier part of this year, with a view to forming an opinion as to what was likely to be the course of prices in the United States throughout the duration of this war. I knew what happened in the last war. I became professionally interested and worked at that.

One of the first things I did was to discover what had been going on in prices and I may say that from my general information I knew what prices usually did during a war and in preparing this memorandum, on the second [fol. 944] page, page 2. I have inserted here a graph which portrays what prices have done during wars in the last century and a half, almost, the last 140 years.

Q. Dr. Friday, what, in general, has been the experience of the United States with respect to prices and price levels during periods of prolonged war?

A. In periods of prolonged war, by that I mean periods from say two, two and a half, three years, four years, prices have had a phenomenal rise in this country and in all Europe, too, and on this page 2 that price rise is portrayed.

The first peak that we have there was the War of 1812 in this country which was simply the American counterpart or the American section of the Napoleonic Wars.

The next one is a war there, a heavy black streak, which is the Mexican War in 1846. That was not of sufficient duration to have any marked effect on the price level in the United States.

But after 1860 came our conflict between the States, which is called the Civil War. That again sent the prices high, although there was no war in any other country. It sent the prices up here although it was our own private war.

Finally, just before 1920, comes the great uprush of prices in the World War, the first World War.

Now, those manifest very much the same characteristics. Wherever you have a war you expect prices to rise. [fol. 945] That is the natural thing for them to do.

Q. May I ask you, Dr. Friday, what is the source of the graph attached to page 2 of Exhibit 61 for identification?

A. The graph that is here shown was prepared by the Bureau of Labor Statistics in an article entitled "134 Years of Wholesale Prices." It was published in the Monthly Labor Review in July, 1935.

Q. And is the precise piece of paper which you have attached, this graph on page 2 of your exhibit, has that been cut out of that Bureau of Labor Statistics publication?

A. Yes, well it was a separate reprint. They had such a demand for them that they reprinted them, except that from '35 on,—this was only brought down to somewhere around '35,—from there on it is traced in ink by myself. The course of prices as shown by the Bureau of Labor Statistics in an exhibit attached to this report entitled Exhibit A which shows the history of commodity prices as prepared by the Bureau of Labor Statistics from 1890 to 1941, inclusive. Those figures from the Bureau of Labor Statistics I have sketched in that piece from 1935 on.

Q. Yes, and Exhibit A is the two pages of what was marked, coming after page 25 of your exhibit?

A. That is correct, sir. Exhibit A shows the Labor Bureau statistics for wholesale prices by months from [fol. 946] 1890 to date and A-2 there shows the prices by weeks for the period immediately preceding September, 1920. I put those in because there was no figure available for September, 1941.

Q. Those two sheets marked "A" and "A-2" are actual releases of the Bureau of Labor Statistics?

A. They are, sir.

Q. Inserted in the copies of this Exhibit 61?

A. That is correct.

Q. Has this price rise experience been true in the United States even though the United States may not have actually declared war or participated actively in hostilities?

A. Yes, it has. That is true this time and was true in the World War up to the time we entered the World War.

Q. I wish you would outline for the Commission some of the data on which you base that view.

A. I took the Bureau of Labor Statistics' figures for wholesale prices by groups and analyzed them to see what had happened to them since the outbreak of this war. The result of that analysis is embodied in the table on page 4.

* * * * * * * *

Q. What does that table show?

A. That table shows the movement of wholesale prices by groups and is prepared from Bureau of Labor Statistics Index which is released monthly for almost 900 com- [fol. 947] modities and is released also weekly, weekly and monthly.

Now, that is shown as Release 6270 on the part of the Bureau of Labor Statistics.

On page 4 I have simply copied from those figures, released by the Bureau of Labor Statistics, the movement of prices for the groups into which the Bureau of Labor Statistics subdivides the commodities.

These are index numbers and they are based upon the prices of 1926 as 100. We take those as 100.

In August, 1939, which was the month before the war broke out, all commodities that are included in this index number stood at 75. That means that they stood at 75 percent of the 1926 prices and when you go down the group list you find that they aren't all at 75 but at various prices, farm products at 61 percent of the 1926 level and foods at 67, and so on down, hides 92 and so on through the list.

By August '40—

Q. (Interposing) By 1940?

A. Yes, which is the second column, these prices had risen but not very much, they had only risen 2.4 points. That is the rise shown in that particular column.

By December, 1940, they had risen a little more, but they were only 5 points above August, 1939, level and they had risen as shown here.

By March, 1941, they were not up so very much yet, [fol. 948] they were 81.5 percent of the 1926 prices; that is, they had risen 6.6 points. That would be 8.8 percent.

Since that time, from then on until September 20, they have risen more rapidly and on September 20, which is the last week I had when I prepared this table, they had gotten to 91.5 percent of 1940.

Now that 91.5 percent of 1940, that index, is 22 percent higher than of August, 1939. Prices have risen that much; you have a 22 percent rise.

Q. That is a general figure for all commodities and there are variations in those prices from a low of slightly under 6 for metals and metal products to a high of 49.5 percent for certain farm products, is that not so?

A. That is correct, yes.

Q. But the average is the 22 percent which you have mentioned. Is that correct?

A. That is correct, that is the average.

Mr. Littman: May I inquire whether the 5.9 for metals and metal products would include such metal products as pipe for transmission lines of natural gas companies?

The Witness: Yes, they do. That is, they are in the metal and metal products groups, two kinds of pipe. The ones that are used by natural gas companies I don't know. I am inclined to think not, but the steel that is in the pipe which is used in the natural gas companies, certainly.

[fol. 949] The reason I am saying this, the two kinds that are in there, they have a black steel pipe which sells by the 100 feet, you people probably know what kind that is, and that is a rather expensive pipe. It costs something like, if I remember in the last war, $4 or $5 per 100 feet.

Then they have another pipe that sells for less, 6-inch diameter. The one that is included here, the pipe that is included in the natural gas companies. There are those two kinds of pipes that are included here and I suppose they must follow the general price of pipe which you use

in the natural gas company. I suppose you use the A. O. Smith Company pipe.

Mr. Wheat: Some of that.

Mr. Littman: And Youngstown Sheet & Tube.

The Witness: But the answer, generally speaking, is yes.

By Mr. Wheat:

Q. And Dr. Friday, is it not a fact, that with respect to metal and metal products, there was an effort on the part of governmental agencies to attempt to arrest a too great or too rapid price rise?

A. That is correct, yes.

Q. That has not been the case with respect to some other types of commodities, has it? A. That is true.

. . . . . .

[fol. 950] The efforts on the part of the Government to restrain the rise in prices here and to control it in some measure has been directed in considerable degree to metals, copper, steel and zinc and so on.

. . . . . .

Q. Will you turn now to page 5 of Exhibit 61 and proceed with your general discussion?

A. Now, these figures which the Bureau of Labor Statistics compiles and which are shown on page 4 are not the only set of statistics which is compiled by the Labor Bureau. It also compiles a group of 28 commodities, basic commodities. Those are compiled every day. You can call up the Bureau of Labor Statistics this afternoon at 5:00 or 5:30 and they will give you the index for this afternoon.

Those are the basic commodities. They are much more sensitive than this big group that we have shown here on page 4 and these are actual prices paid. The group on page 4 has largely quoted prices.

Q. May I ask you, Dr. Friday, have you brought up from the daily indices that you have discussed, have you [fol. 951] brought your figures up to approximately a week ago today? A. Yes, to the end of the month.

Q. September 30, 1941? A. That is correct.

Q. Will you proceed with your discussion?

A. These 28 basic commodities have also risen, and they have risen a good bit more upon the whole than this larger group, which, as I said before, is shown on page 4 and this covers practically 900 commodities.

These 28 basic commodities had risen between August 29 and September 30 by 55.7 percent.

Q. You mean between August, 1939, and September of 1941? A. They rose 55.7 percent.

If I may go over them by dates, during the first year, that is from August, '39, to August, 1940, they rose only 5.6 percent.

Let me say one thing more about it. I have not put in here the index for those 28 commodities in September, 1939, and in October and November, that index would have stood at the highest point in those months at 127.

What we had directly after the war broke out was a rapid rise in commodity prices so that these 28 commodi- [fol. 952] ties ran up to 127, but by the middle of August of 1940, the year afterwards, they were back down to 105.6 percent. That means they had only risen 5.6 percent, that was all.

The first rise in commodities largely fizzled out during the nine months from about November, 1939, to August, 1940, and it stayed low then for a considerable length of time. Even on December 31, 1940, it was only up 18 percent and in March, 194.., the end of this last March, was only 137 for these 28 commodities.

Now, however, it stands at 155.7.

Q. And as far as foodstuffs are concerned, it is up as high as 170, is it not?

A. As far as foodstuffs are concerned, it is up to 170.8. In that connection it is interesting to note how the rise did go. The import commodities were among the first to make a decided move upward, that is on the 31 of March, 1941, there was already considerable shipping shortage and considerable difficulty with shipping, import commodities had risen 44 per cent while the food had risen only

33 and the domestic commodities only 29. They have since been as high, I think, as 155.7 and have been fluctuating around there for some time.

Q. That is a much larger increase, is it not, in general, of the 28 basic commodities than the movement on the general index number which is shown on Exhibit A at the [fol. 953] end of the book?

A. That is correct. That was only 22 percent and this is 55.

It explains, however, and helps to make us realize why a war will practically always produce a rise in prices. All imported commodities, if you are in a war in which there is an attempt to interfere with commerce and the sinking of ships and there gets to be any shortage of shipping, we will have a rise in the imported commodities and we will have it pretty quick.

There is nothing you can do about restraining that rise. There is simply a shortage of shipping and an enormous increase in shipping rates and the price goes up. That is one of the other evidences that we have had all along as to how prices were going.

I want to summarize right there, if I may, and make this point clear, that it is the natural thing for prices to rise in time of war.

Q. Why is that, Dr. Friday?

A. Well, it is due to the fact that every war, especially every modern war, results at once, after it breaks out, almost at once in a large increase in demand for commodities, because modern wars are fought with materials. That was especially true of the first World War, it was of this and it was even of our own Civil War which in many [fol. 954] respects was the first modern war. It was the first modern war fought after the railroads came. That, at once, then adds to whatever demand there was before the war came an additional demand for products, an additional desire and want for them. Not only is it that the people want more products, but it is a desire that comes from a quarter where there is a purchasing power to make that desire effective.

In any nation such as the United States there is power that is very large, it runs into billions of billions of dol-

lars, almost unimaginable, to pay for goods and at once you have not only this demand for things that we have had before, but you have demands from an organization that can make its demand effective, because Government has the power of taxation and the Government has, besides that, the power to borrow both from private individuals and from banks.

If the banks haven't got the money they can create credit and loan that to the Government so that you have at once a great increase in demand and a great increase in purchasing power because of the fact that the Government proceeds to buy commodities in large quantities and it is obviously the institution which has the greatest amount of purchasing power.

There are other reasons, one of them is the fact that the Government here doesn't buy with a view to reselling. [fol. 955] It doesn't buy it with a profit motive in mind. It buys with a view to gaining an end that is of enormous consequence and enormously important to the people. It becomes an absolute end in itself, so to speak.

You have to maintain the dignity and honor of your Government. To do it, you not only spend money, you spend life and all the old values pass away. You send your son forth to be killed, if necessary, without hesitation, so that you have an entirely new phase of demand in the situation and an entirely new aspect of demand coupled with practically unlimited purchasing power.

Certainly for the time being any such increase in demand would raise prices and it does raise prices. That is the natural thing for prices to do. If they can be restrained at all, nobody has yet succeeded in restraining them to anything like the level which exists at the time that war broke out, unless it be Germany, and it has done it by the methods that a dictatorship uses.

First it fixes a price at which goods can be sold and then having fixed that it fixes all the labor cost back. If you can do that and have a good enough police force that can detect any infringement of your law and that promptly prosecutes the offender, you can pretty well control prices.

Q. Is that possible in a country like the United [fol. 956] States, in your opinion?

A. We have no such police force as that and public opinion, anyhow, in my judgment, wouldn't stand for it. There would be no desire to do it here.

Q. I wonder if you would like to go back for a moment now and contrast what happened in the World War, starting in 1914? I believe on page 7 of your Exhibit 61 are to be found certain data on that subject.

A. Yes, naturally when we had the World War there was a great increase in prices and naturally when these prices began to rise,—may I say parenthetically that in the first year of the war we felt this wasn't going to hurt us? Prices didn't rise much.

Q. That is in 1914?

A. 1914 and this time, too, prices didn't rise much until after the fall of 1940. That same thing happened in the World War.

I have set down here on page 17 in the briefest possible compass just what did happen to prices in the World War. These prices are all shown on this Exhibit A and A-2, also.

Q. And are to be found in the little tabulation at the bottom of page 7? A. That is correct.

Now, in July 1914, that was the month in which the war broke out, I think July 28, it was just at the end of that [fol. 957] month, the price level stood at 67.3. That was on the basis of '26 as one hundred.

In the course of a year it had risen very little, less than 3 points in 15 months. Then it began to rise after that and by the 25th month, I chose that because we are now in the 25th month of this war, I mean Europe is, the World is, they had risen to 86.1 and so on down.

Q. You mean 85.1, do you not? A. 85.1.

I took this 67.3 as 100 and constructed the next column, it says "On the Basis of July, 1940" and divided the 67.3 into 70.2, that is 103. The next is 126, so that by August '16, which was the 25th month of the World War, prices had risen 26.4 percent.

Q. By August 1916?

A. Yes. We are now in the 25th month of the war and we saw on page 4 that prices had risen 22 per cent this time. I may say that that difference in the rise of prices is largely explained by the fact that in 1914 there were certain conditions that existed that didn't exist this time.

We had the merest fraction of the chemical industry in 1914 that we have today. We didn't have any chemical industry in the sense which we have now.

I think dyes is a subject familiar to all of us who are old enough to remember 1914. Our dyes came from Ger- [fol. 958] many, and so that commodity ran up at an enormously rapid rate. It got up from something like 70 when the war broke out to 170 by the early months of 1916.

Also, in the field of metals and metal products, copper particularly, when it became evident that the war wasn't going to be over in six months or in a year, as the Germans had thought would be the case, and the Europeans came here in 1915 and began to place orders in large volume, then there came to be a great demand for copper.

Michigan was still a great copper producing state and up there we were perfectly familiar with what went on. Fifteen cents was considered a normal price for copper. But Europe came in and bought copper in great quantities in '15, the latter part of '15, and they found there were no supplies of copper or very small ones and that commodity was bid up and bid up until in the spring of '17 it was 36 cents. That is where copper stood. It had gotten down as low as eleven and a half cents in '14. There was a depression in Michigan and Detroit in September 1914, but later copper ran up.

Now, in this war there was no such great demand for copper from Europe as that, besides which there was control of price of copper as one of the first industries with respect to which they made such a control arrangement. There were only six producers that produced the great mass of copper and copper was pegged early this time.

[fol. 959] But aside from the chemicals and this special movement in metals, the speculative movement, largely, that then got to be a speculative movement in those days,

so that I think it explains why the price went up a little less this time than then. We didn't have those conditions in the present war.

Q. What happened after that month of the war?

A. By March 1917, when we entered the war,—we entered on April 6,—the prices had risen 60 percent, but they went right on rising after the 25th month. By August 1917 they had risen 84 per cent. Then, they didn't rise so much more from August, from that high level of 84 percent rise Government began then to control prices, reduce them somewhat from that high level. Copper was reduced from 36 cents to 26 cents and pegged there and the price rose less.

By the time of the Armistice prices had doubled. They stood at 202. They were twice as high as in August 1914.

Q. Did they go down?

A. They acted like they were going down for a month or two; they went down several points.

Q. Then what happened?

A. Then they rose and by May 1920 they stood at a level which was practically two and a half times as high as it had been in July 1914. It was almost the universal opinion of business men and many economists, too, that [fol. 960] prices, of course, would fall greatly after the war. People wrote articles about it. One of the New York banks I remember put out two pamphlets, one called "When Prices Fall" and "When Prices Drop" signed by the president of that bank and that was a pretty general notion.

By April 1919 they started up again and instead of having the great business slump that we expected at the end of the war, business improved and we ran into a post war boom which lasted throughout the rest of 1919 and on into May from [—] and June 1920 and by that time prices were almost two and a half times as high as they were at the outbreak of the war.

* * * * * * * *

[fol. 961] A. So far prices have moved just about as they did in the World War the first. There is no material difference. And I, myself, don't see any reason to expect

them to move materially different. I expect to see a further rise in prices from this level and I expect to see it extend not only to the end of the war, but I expect to see it rise further after the war, not merely because it did then, but because the reasons which were then operative are operative now and will continue to be operative.

Q. Yes. I take it that on pages 11 to, I think, 14 of your Exhibit 61 you have discussed the reasons for price rises during war and you have outlined briefly those reasons.

Have you anything further you wish to state on that subject you possibly have not discussed?

A. I have this to say, there is this difference between this situation and the last situation, seemingly, this seeming difference, that we are now discussing the possibility and the desirability, not only the desirability but the possibility of restraining commodity prices from further rises in this country.

. . . . . .

[fol. 963] Q. Dr. Friday, I wish you would continue with your discussion of the economic forces which are at play in connection with a rising price situation such as the one we are now facing.

A. When you come to the situation that we now have before us where we have already a very greatly increased demand on the part of Government and when that increased demand on the part of the Government has been accompanied by a great increase in demand on the part of the public which, because of the revival in business and the great increase in productivity, finds itself in possession of greatly augmented purchasing power, then we are in a situation where the forward movement of prices, the forward movement of prices of practically all kinds is inevitable.

Now, we all know that these prices are up 22 percent and we all know, furthermore, that the purchasing power of the people has been greatly augmented.

I have been studying this matter of what has just happened to wages. Taking the survey of current business [fol. 964] and the figures that are there given of wages other than wages paid in agricultural, we find that month

by month in this year the wages paid are $1,000,000,000 a month above last year.

Now, in such a situation there is a great mass of people who have purchasing power in the form of money that they didn't have before and you are certain to have a greatly augmented demand for commodities and that is what we are having. That is why in recent months your price level has been advancing rapidly.

Now, there is another reason why the price level has been advancing rapidly in recent months, a reason which we didn't have back in the World War and that is the fact that our Government has definitely adhered to its policy, which it followed before the war, to increase the farmers' income. That is to increase the prices of agricultural products.

As you see on page 4, a very large part of this increase of 22 percent that we have had thus far came in agricultural products have increased 49.5 percent and the President in his statement which he made and which appears somewhere in these pages, said definitely, as justification for signing that bill in May when the amount of loans which the Government was willing to make against agricultural products was increased to 85 percent,—the President said that that was, it had been and was now the policy of the United States Government and he was signing the bill on that account.

[fol. 965] Q. Now on page 15 I see that you state that there is no likelihood, in your opinion, that costs of production will fall during the present war nor for some years thereafter. I wish you would briefly tell us your reasons for that conclusion.

A. Yes. The first reason, on the matter of the rise in prices, why it is bound to continue, is that it is in entire conformity with the governmental policies that we have,—and I know of no objections to it, certainly no party objects to it,—that is to increase the farmers' prices. You can't increase the farmers' wages because the farmer does

his own work and doesn't work for wages. If he is to get more money he has to get it in prices.

Now, second, some governments have at times had some success in restraining prices, but they have only done it, any governments that have been at all successful, by restraining wages.

As a matter of fact, the only manner in which you could possibly restrain prices and hold them at a level say such as we have now, 91, on the basis of '26 as one hundred, would be to increase production of the commodities that people want and to do it at a cost so low that people would [fol. 966] offer them for sale at the old prices.

Now, if we could do that, if an increased flood of all sorts of commodities were coming on the market, it is imaginable that the prices might remain stationary here, but to do that you would have to have a cost of production which is stationary and which is low.

Now, the most obvious thing about your cost of production is that the principal cost of production, namely, labor cost, is not low and is not stationary. It has been rising right along.

Q. Do wages tend to rise during war?

A. Yes, wages always tend to rise. They did during the last war and they do during this one and it is the policy of our Government to increase the wages of labor and to increase the share of production that goes to labor.

Now, for manufactured products, by far the largest part of the cost of production consists of labor. You are inclined to say, "Well, what about material costs?"

In the automobile business they buy parts. Well the parts again are products and they are largely made by labor, so that when you resolve the general price of manufactured products, you find that after all the greater part of it is labor.

We know how much of it is labor. The Commerce Department reports annually and periodically, especially an- [fol. 967] nually on the size of the national income. That is it reports the sum total of the value of all of the pro-

duction that is turned out and upon the disposition that is made of it.

Now last year, 1940, the manufacturing operations of the United States resulted in an addition of $19,000,000,000 to the national income. That is, that was the sum total of the net product of all manufacturing industries and it also shows,—this is in the survey of Current Business for June 1941, there is a special article on the national income during 1940,—that of that $19,000,000,000, $15,000,000,000 of it went for labor, went for wages and salaries. So as long as you have a policy in which labor cost is not restrained and in which wages are not restrained, obviously the cost of production isn't restrained. There is no prospect in the world that I can see that it will be restrained.

. . . . . .

[fol. 968] Q. Dr. Friday, have you included in your discussion in Exhibit 61 for Identification data with respect to the increase in wages?

A. Yes, sir.

Q. And have you shown that these wage-increases are in operation in this country at this time?

A. Yes. I have also shown what happened to them formerly, during wars, as shown by the last war.

Q. Yes. What did happen to them after the last war?

A. I have here two graphs that show, I think, more briefly and concisely than anything else, just what did happen to wages during the last war.

Naturally, our recent data isn't as abundant or as good as our price data, but there is, especially during the last war, from 1914 to 1920—there is a record of the average weekly wages in manufacturing industries in New York State, which runs back to 1914 by months.

Q. That is Exhibit B?

A. Exhibit B.

Q. At the end of Exhibit 61.

A. Now, Exhibit B is a graph, which is prepared from the figures published monthly in the New York State Department of Labor, and this graph shows—and the figures [fol. 969] at the left side of the graph—these are not index numbers, these are actual dollars per week.

Going back to 1914, you will find there wages were half way between $10 and $15, or $12.50.

In the middle of 1914, they rose gradually—not very much—through 1915, more through 1916, and in 1917, and finally in 1918 they had a very rapid advance. That is shown by the graph here.

Then there was a lull in the wages paid per week in the early part of 1919, after the Armistice had been signed, and then another rapid advance to the middle of 1920 and after.

Now, at the beginning of that period, wages stood at $12.50 and at the end of it, they stood at some $29.

They fell during the depression of 1921—the great post-war boom of 1920 came to an end during the summer of 1920 and they fell. It was generally believed at that time, and if you will examine the discussions, you will find they give evidence of the fact that people generally believed that these wages which had gone from $12.50 to $29 would have to go back somewhere not far from $12.50.

The general effect, however, that actually happened, is shown on this graph. They went back a little under $25, and in New York factories,—and I may say at the time I made considerable study of what had gone on in Detroit, especially, and that is the place they had gone highest, and [fol. 970] there again they didn't fall anywhere near as much as we expected them to.

Q. Then they reached another peak during the last year of the 20's?

A. Yes, with the return of good business in 1923, and rose and continued to rise throughout the 20's until they reached a peak in 1929, which was a little above the peak in 1920, and that was a little above $30.00.

They fell with the Depression—1929 to 1932, revived in 1933 with the Code, and then continued rising, first to a peak in 1936, and finally passed through the old high level of $30.00 which they had reached in 1929.

Q. What has happened during the current year?

A. During the current year they have gone from $30.00 to somewhat over $34.00 as this graph shows (indicating). They are still on their way up. These are wages per week.

I have also made a study shown in Exhibit C on the top graph of wages per hour in the manufacturing industry. This study was made from the data that is collected monthly by the National Industrial Conference Board. It is for twenty-five manufacturing industries. There are no figures available by months from the middle of 1914 to 1920, but there are figures available for the single month of July, 1914.

At that time—and here again the figures along the left-hand side are not index numbers, but wages per hour.

The wages in July, 1914, stood at $.25 per hour, on the average.

[fol. 971] Detroit was somewhat higher, or the Detroit area was somewhat higher because Mr. Henry Ford had put in his $5.00 a day wage plan during January, 1914, and so Detroit is a little above this, especially in the automobile industry, but the wages rose from 25 cents to over 60 cents, as shown here (indicating).

They got up there in the latter part of 1920. They fell in 1921, and dropped down to a low in 1922, which low again was far above the 25 cents that had been the average wage in 1914.

Q. The same is true with the low that occurred in 1933, is it not?

A. And then in 1933, again, even in that serious depression, it only got down to 45 cents.

Now, after 1933, we had an almost perpendicular rise with the revival of business in the Spring and Summer of 1933, and they rose here (indicating) until they got, in 1934, to a level which was very much like that which prevailed in the 20's.

In 1935, just at the end of the first six months, first six months of 1935, they passed through the old high. These are wages per hour, and they passed through the high of 1929, and with the revival of business in 1936 and 1937, they made the further advance which is shown here,

and then with the CIO and the sit-down strikes, they took [fol. 972] that perpendicular upward rise there in 1937 to 72 cents.

That is portrayed here, and then, with the depression of '38, they did not go down again but remained at about 72 cents. Now with the war, especially since the latter part of last year, they have taken another perpendicular advance and stand now at 82,8 cents. That is the figure for August. That is what is happening to wages.

Q. Is it a fact that at this time there is also a higher concentration of organization in labor that has had some effect on wages, that has had some effect on wages?

A. That is one of the great differences this time, as against the World War. We have at this time a high degree of organized labor. Industry is much more widely organized; many more workers,—that is number one; and, number two, they have very able leadership. It is their business to get higher wages. They know what they want and they know how to get it, and there is no sign of any cessation of that general movement of wages yet, and that is true of all industries. You can't raise wages in one part of an industry without getting into all of them, just as the price level spreads itself finally into every nook and corner of industry, so does this rise in wages. I don't see any chance of reducing costs. It seems to be perfectly clear we are going to have further increases in costs as we go along.

Q. In that connection, Dr. Friday, have you considered [fol. 973] the relation of taxes to prices?

A. Yes, I have considered that question.

Q. Have you discussed that subject in your Exhibit No. 61? A. Yes, sir.

Q. Commencing on page 20 of that exhibit?

A. I have discussed it very briefly, and what there is here I thought might be of illumination to illuminate the mind of the Court somewhat. I discovered the figures.

It is the table which appears on page 21.

Q. Will you briefly explain what is shown on that table?

A. On page 21 is a table showing total taxes, collected in the United States for Federal, State and Local purposes. That includes everything. It includes everything from

excess profits taxes to the tax on millionaires, collected by the Federal Government, right straight down to City, County, School District, and Road taxes, and that total tax of 1914, when the World War broke out, was $2,383,000,000, and in the year 1917,—these are fiscal years by the way—the year ending July 30, $3,158,000,000. That is what taxes were when we entered the war.

They rose as shown here (indicating) and they finally got to a peak in 1920 of $9,204,000,000. That is the total tax bill upon corporations and individuals and all tax-[fol. 974] payers in the United States.

It got to a peak of $9,204,000,000.

Q. 13.54 per cent of the then national income?

A. That is correct. They fell, as shown here, until in 1923, they were only $7,200,000,000 and they rose again and in 1940, the tax bill in the country was $14,300,000,000 and since then it has risen, and in the fiscal year which has just [begin], it is my opinion that taxes will be $22,500,000,000. In fact, they won't be a billion away from that one side or the other.

Q. And what per cent will that be of the National income?

A. I estimate the National income will be $90,000,000,000 for this fiscal year, and that is 25 per cent.

It simply shows the change, the radically different situation that we have with respect to taxes.

Q. Now, what have you to say as to the general price level by June 30, 1942?

A. Well, prices will rise, and the best estimate I can make, the best opinion I have, is that prices will be up to a level of 110 by next year—by June, 1942.

Q. A level of 110 on what basis?

A. On the basis of 1926, as a basis. They will be up to 91.5 to 100 by the end of the year, and 110 by next summer.

Q. And you feel your opinion is bolstered—do you think [fol. 975] it is bolstered by any statement of policy of the United States Government?

A. Yes. I, myself, am surprised at the great amount of talk we have had about inflation. People tell us that prices have gone up 22 per cent here since August, 1939,

and they talk as though that was a most serious matter, and use the name "inflation" to designate that.

Well, it wasn't what we thought of as inflation in this country at all—I am sure when we think back and remember what the President's attitude on taxes were at 1933—he said in 1934 we would have to get the price level up to 100. He said if we couldn't do it one way, we would do it the other, and he wanted debtors to be in a position to pay back their debts in dollars of the same purchasing value that they had had before, and that was the feeling that we would have to get up to practically that before we could get a revival, so there hasn't been any tremendous increase yet. 110 would not be a surprisingly large figure.

I think, by the way, I think the efforts that are now being made to restrain the rise of prices in the OPACS, as Mr. Henderson calls it, is one of the reasons it is not going to be higher than 110 by a year from now, and let me say further that the question of how high prices are going to go after that, they will be up pretty continuously during the duration of the war, and it all depends on just how long [fol. 976] the war is going to last.

Q. What have you to say, Dr. Friday, of the price problem after the war?

A. The price problem after the war, as I see it, will be just as it was after the last war. We are going to have another advance in prices over and above that which we have already had. I have already said we didn't expect that advance during the period after the last war, but I am sure we will have it this time, and we will have it largely because we are having this question of restrictions. We had it last time, we had the same questions on restrictions, and house building, and if you look at the cement figures last time, the cement production was down, automobile production, and we have the same restrictions now, but probably more so because raw materials are serious problems. The more you restrict the purchase of these things which the people want to minister to their wants and maintain their standards of living, the more intense is going to be the want for that.

Now, merely an intense want for things doesn't necessarily lead to the belief that things will go up.

I came to the conclusion after careful study of that—prices rose during 1919 and the first half of 1920. I came to the conclusion that obviously, of course, production had been restricted, but that the purchasing power to give business that impetus which started prices up again and led to the boom we had in the United States and the greater [fol. 977] period of industrial activity in 1919 and 1920,—that the purchasing power came from the bonds, Liberty Bonds that were bought during the duration of the war.

Those of us who are old enough to remember what happened then know what happened. The people who bought bonds in small quantities—I mean the man who bought $25, $50, $200, $500 or even $1,000 didn't keep his bonds. What could he do with a $200 bond, or a $500 bond? His wife wanted some furniture. They wanted an automobile, or an improvement on the house—any one of those numerous things that people want when they have gone without them for years, and they went out and sold the bonds. Just to refresh our memory, I say that the price of Liberty Bonds at that time, 1920, was down to 85. The same Liberty Bonds are selling now for $110.

I followed that thing with a great deal of interest. Everywhere in the cities—they were small places, holes-in-the-wall, as we call them where people sold bonds, and they bought these things which they wanted.

If we are fortunate enough to finance this war largely by a sale of bonds, to a great mass of people, so that the great mass of people that want things will have the bonds,—and I hope and believe that restrictions on their sale will not be put upon them—we will have the same thing happening again. We are having restrictions upon the [fol. 978] goods that people want in their homes, and if we sell these people now bonds for a part of their income, we are going to get another uprush of prices now as we did then.

Q. And will those uprushes of prices go to all phases of the cost of operating business?

A. Yes, all phases, and to the whole phase of prices. I looked that thing up a year or so ago. I was interested in that to see whether it wasn't limited to some one phase of it, and it isn't.

Q. And no business is exempt?

A. No business is exempt, except perhaps some declining business. But no business is exempt.

Q. Now, what is your conclusion with respect to the stabilization of process after the war period?

A. The stabilization of prices after the war period will be somewhere below the high peak that we reach after the uprush of prices which will follow immediately upon the war.

Q. What do you think that high peak will be, based upon your studies?

A. Well, if the war should last—it depends on how long it lasts, but suppose it lasts until the end of 1943—suppose it lasts two years more, I can't imagine that the price will be less than twice the price level that prevailed at the [fol. 979] outbreak of the war.

Now, the price level at the outbreak of the war, that is, the price level in August, 1939, was 75, and I believe that on the basis of 1926 as 100, it will be at least 150. That would be my opinion. I say that is putting it moderately; and that is making full allowance for this restriction we are putting on prices, to insure an orderly advance, rather than a runaway market.

Q. And have you formed any opinion with respect to the probable stabilization of prices after the post-war period, or after the preliminary post-war period?

A. Stabilization will be somewhere below the peak. They will also be decidedly higher than the prices which prevailed at the beginning of the war. Now, if I may give my observation on the experience after the last war. We had here a price, as we saw on page 11, of whatever that was there; that was 248 per cent of the price at the outbreak of the war. We thought those prices were going down somewhere back toward the 1914 level. They didn't. The prices in 1914 were 67.3 as shown in Exhibit A here, and from 67.3 in July, 1914, they ran up to 167 in May, 1920. That is 248 per cent. They didn't fall back to 67.3. They fell back to 91 in a single month or two, early in 1922. By 1926 they were at 100. It was 50 per cent above the old price level, and there they stayed. The prices in 1923 had been a little above that, but in 1926 they were 100, and [fol. 980] we took that then as the normal year.

I believe something just like that is going to happen in the next period.

You can't put prices down to the old pre-war level, because the cost of living has gone up, and it doesn't go down with the prices—the prices pull the cost of living up as they are rising, just as they did in the last war, and that is Exhibit C that is attached.

Q. Do you visualize any escape on the part of any citizen, or corporation engaged in business in this country, from the result of the price rise to which you have testified?

A. I can't see any escape from it, no.

* * * * * * * *

[fol. 981] Trial Examiner: Before you start with your next witness, Mr. Wheat, I think, perhaps, I will ask you whether you would like to have Mr. Sperry prepare a tabulation as a result of his testimony on working capital. I personally would much prefer to have him prepare the tabulation resulting from that testimony.

Mr. Wheat: Yes. We will be happy to have Mr. Sperry do so, and we will present it at some stage of the hearing. I think I understand, Mr. Examiner, that you would like to have Mr. Sperry develop a table of the items here covered?

Trial Examiner: That is right, the working capital was [fol. 982] approximately $1,500,000, and there were a great many details considered in arriving at that. We have the testimony in the book beginning at page 452, but a table made by others might not exactly meet Mr. Sperry's conception of the testimony.

* * * * * * * *

P. McDonald Biddison, previously sworn, resumed his testimony:

Direct Examination.

By Mr. Wheat:

Q. Mr. Biddison, have you prepared a document entitled "Panhandle Eastern Pipe Line Company and subsidiary companies, deduction from cost of reproduction new for depreciation and present value of plant, property and business as of June 30, 1941?"

A. I have.

Q. Is the document which I now show you the document in question? A. It is.

Q. Was it prepared by you, or under your direction?

A. It was.

Q. Do you believe that it correctly states what it pur-
[fol. 983] ports to state? A. I do.

* * * * * * * * *

(Document referred to was marked as Exhibit Number 62 for identification.)

Q. Now, Mr. Biddison, will you turn to page 1 of the document which has been marked Exhibit No. 62 for Identification, and state the figures which appear on that page.

A. The figures are, first, $4,121,749.80.

* * * * * * * * *

Which represent the amount of depreciation which I estimate to have occurred in the plant of Panhandle Eastern Pipe Line Company and its subsidiary company, Illinois Natural Gas Company, as of June 30, 1941.

The second figure is $79,711,698.74, which is my estimate of present value of the plant, property and business of Panhandle Eastern Pipe Line Company and its subsidiary company, Illinois Natural Gas Company, as of June 30, 1941.

This last figure is arrived at upon page 2 of this exhibit by deducting the first figure from my estimate of reproduction cost new of those properties, as of June 30, 1941, in the amount of $83,833,448.54.

This last figure, and its component parts, as shown on page 2 of Exhibit 62, are from Exhibit No. 39 and its
[fol. 984] corrections, 39-A.

Q. So that all the figures in column "(B)" on page 2 of Exhibit 62 are derived from and their details may be ascertained in Exhibits 39 and 39-A; is that true?

A. That is correct.

Q. Now, then, the items contained on columns (C) and (D) of page 2 of Exhibit 62 are items, are they, which are developed in the detail shown on the following pages of Exhibit 62?

A. Both the items shown in columns (C) and (D) on page 2 are developed in subsequent detail in this Exhibit 62.

Q. Yes. But the items in Column (D) are essentially subtractions from items in column (B), are they not?

A. That is correct, and the items in column (D) are the result of that subtraction.

* * * * * * * *

Q. State what are the items in column (C)?

A. The items in column (C) totalling $4,121,749.80 are the amounts by which I estimate the various classes of property have depreciated in value as of June 30, 1941.

Trial Examiner: When you say "the various classes of property," do you mean the physical property now in use, the plant, line actually in use, and those only?

[fol. 985] The Witness: I mean only the presently existing plant; not plants which have been retired or otherwise disposed of by sale, or any other means. The presently existing plant on the basic date.

Trial Examiner: In other words, you are arriving at a figure which you say represents the present existing depreciation in the property of Panhandle Eastern and its subsidiaries now used and useful in the public service?

The Witness: That is correct.

By Mr. Wheat:

Q. And your testimony now has nothing to do with any property [—] be acquired in the future?

A. No, sir; nor with any disposed of in the past.

Q. Yes. Now, Mr. Biddison, for example, will you take some item or some line on page 2 and state what you find to be the fact as to the depreciation existing in that particular item?

A. Starting first with Line 2, "Land." This particular land being production system property, its reproduction cost new is $971.02. It is my opinion that there has been no depreciation on this land. I therefore made no deduction for it, and I have arrived at its present value in column (D) in the same amount, as its reproduction cost new figure.

The next item, line 3, page 2, "Leaseholds" is shown in [fol. 986] column (B) at the reproduction cost new and present value as determined by Mr. R. J. Wallace; he having determined present values. I have made no deductions for depreciation of "Leaseholds" and have carried them across into column (D) at the same figure as they appear in column (B).

* * * * * * * * * *

My column (D) represents the estimate of value as of the basic date of the report, and Mr. Wallace's determination of values was as of that date. I therefore had no deduction to make from his report to ascertain values.

* * * * * * * * * *

The deduction for depreciation on gas wells is recapitulated on page 4 of this exhibit and the details which are recapitulated upon page 4 are set forth in subsequent pages 5 to 8 inclusive.

I saw upon an inspection of property of Panhandle Eastern Pipe Line Company, beginning on August 17, 1941, a considerable number of the wells owned by Panhandle Eastern Pipe Line Company in the Texas Panhandle Field and in the Hugoton Field. Their appearance was uniform—that of being well-maintained. However, records available in the Kansas City office indicated that [fol. 987] on some wells, depreciation had occurred. It was not visible by inspection of surface equipment, and also disclosed that there were some wells in the Texas Panhandle Field located close to areas of oil production of which the rock pressure had declined to figures below that at which their drilling would not be justified if they had not already been drilled.

In determining the amount of money to be deducted from the reproduction cost new of any of the gas wells in these two fields, I have been giving consideration to the question of whether it was affected by the factor of obsolescence, due to depletion of the reserves underlying it, or to the factor of underground depreciation or deterioration disclosed by well history.

If no such factor existed, and no data existed to indicate material depreciation of the above-ground equipment, I depreciated the well one per cent for each year of age.

Q. On what ground?

A. On the ground that wells do depreciate with age and that with the small amount of depreciation that can now be detected by examination of those wells, depreciating them on the basis of one per cent per year of age was a liberal allowance for the amount of depreciation which had occurred on those wells.

I have depreciated other wells on the basis of some of the other factors which I have mentioned, and I call at-
[fol. 988] tention to some of them.

Line 15, the well Burnett No. 1-84-1013A, I have depreciated that well, which was drilled in 1930, 15 per cent, because of the decline in its rock pressure.

Similarly with the well shown at Line 21, I have depreciated that well 15 per cent.

At Line 5, Sneed 1-23-1903A, this well apparently has water-leakage into the casing as a result of a poor cementing job. It needs re-cementing and needs a new master gate. I have depreciated that well 25 per cent.

That explains the method which I have used with respect to wells, and the working papers will show the details with respect to any individual well.

Q. And have you listed all of the wells, in Exhibit 62, showing the amount of depreciation which you have found, after examination, to exist, in your opinion, in those particular wells?

A. Yes. I think I should make a further explanation with regard to wells in the local area.

Q. Please do. A. Shown on page 8.

Q. Of Exhibit 62? A. Yes.

These wells in the local area are shallow wells and generally have quite low rock-pressure. The last available
[fol. 989] tests of rock-pressure and open-flow on these wells was as of September, 1936.

At that time, the rock-pressures on the wells tested ran from 12 pounds to 75 pounds, and the open-flow varied

from 10,000 cubic feet per day to 100,000 cubic feet per day. I have estimated that these wells have residual values from their costs of from 7 per cent low to a maximum of 25 per cent, and I have made a deduction for depreciation on those wells in accordance with those figures.

The details for those individual wells are shown in my working papers, but for wells in the Kansas side of the local area, I have deducted for depreciation $8,583.91 from a reproduction cost new of $10,518.32 to arrive at a present value of $1,934.41.

Q. What about the Missouri local area?

A. On the Missouri side on the local area, I have deducted $4,084.67, from a reproduction cost new of $5,060.49 to obtain a present value of $975.82. This is on eleven wells in Missouri and eleven wells in Kansas for the respective pairs of figures.

Q. In other words, you have developed a rather small residual value in respect to those particular local areas—particular local area wells?

A. Yes, I nearly wiped them out.

Q. All right. Now, Mr. Biddison, is there anything [fol. 990] further that you wish to state in explanation of the items contained on pages 5, 6 and 7 in connection with production system gas wells, excluding those of the local area?

A. Well, only that both as to those wells and as to the local area wells, the figures derived on pages 5 to 8, inclusive, are carried forward on to page 4 where I arrive at a total deduction for depreciation which has occurred in wells of $180,364.61 to obtain a present value of $1,873,519.78, which in turn is carried forward to line 4 on page 3 of this same exhibit.

Q. And also to line 6 on page 2, is it not, the general summary? A. Yes, sir.

Q. Now, have you explained in detail all of the methods which you used in arriving at the amount of depreciation which you estimate has occurred in the individual wells shown in the list on pages 5, 6, 7 and 8?

A. I have.

Q. All right. Mr. Biddison, will you turn to the item of "Other Production System Structures," which you show on line 5 on page 2 and state what depreciation you

found to have occurred as to those structures, and also state what those structures are and your methods of arriving at this depreciation?

A. The structures are those at the Camps in the Texas Panhandle Field and the Hugoton Field. They are [fol. 991] detailed on pages 10 and 11 of this same exhibit, No. 62. Upon my inspection, I made notations of the conditions of various structures at these locations, and I have applied the results of those observations to the reproduction cost new as estimated by me in Exhibit 39, to determine the amount of money to be deducted for depreciation on the various items of property.

Those deductions are shown in detail in column (C) on pages 10 and 11 and totals for each group are carried forward from pages 10 and 11 in the recapitulation on page 9, where I show a deduction for depreciation of Other Production System Structures of $5,615.44 in column (C) to be deducted from $42,188.75, to obtain the present value in column (D) of $36,573.31.

Mr. Goodman: I have an objection. I move to strike all the testimony Mr. Biddison has given on the subject of accrued depreciation heretofore given, for the reason that he has not undertaken to state any basis whatsoever for the conclusions which he reaches, and they stand on the record merely as gratuitous conclusions. While it is conceded that the opinion of an expert may be placed in testimony, yet, on a subject such as valuation, or depreciation, it is necessary even for the logical probativeness of such testimony, that it be supported by basic facts so that we may be informed as to what facts the conclusions are drawn from. So far, the witness has testified only that he observed certain things. He has not [fol. 992] told us what he observed, and he depreciated it.

I submit that that is not adequate to that conclusion, and I therefore move that the testimony on the subject be stricken.

Trial Examiner: The witness is entirely qualified as an expert, and the motion will be denied at this time. The

witness will be subject to the usual cross-examination, which will enable you to determine whether or not the conclusions which are expressed in his proposed exhibit are well founded.

. . . . . .

[fol. 995] PAUL BROWN COFFMAN, called as a witness for the Panhandle Eastern Pipe Line Company, being first duly sworn, was examined and testified as follows:

Direct Examination.

By Mr. Wheat:

Q. Mr. Coffman, will you please state your full name, and your address?

A. Paul Brown Coffman, 222 Sylvania Place, Westfield, New Jersey.

. . . . . .

I am a graduate of Ohio State University in 1923 with a degree of Bachelor of Science, a graduate of the Graduate School of Business Administration, Harvard University in 1926 with a Master of Business Administration Degree.

[fol. 996] My present position is vice president and director of Standard & Poor's Corporation, 345 Hudson Street, New York City, which is a recent consolidation of Standard Statistics Company and Poor Publishing Company, publisher of Poor's Manuals.

. . . . . .

I am in charge of research and valuation.

Q. And what, in general, are the activities of that corporation?

A. Well, Standard & Poor's Corporation is a company which gathers, collates and disseminates information pertaining to business, industries, commodities and investments, and offers services on a printed basis and on a professional and personalized basis.

. . . . . .

Upon graduating in 1926 from the Graduate School of Business Administration of Harvard University, I went to

the College of William & Mary in Williamsburg, Virginia, where I was professor of economics and accounting for approximately a year and a half.

In 1927, I returned to the Graduate School of Business Administration at Harvard University to join the faculty, and I remained there approximately 10 years, teaching [fol. 997] business policy, corporate management and accounting.

During the time I was at the university teaching, I served as consulting economist for a number of various business organizations and financial advisory firms, including both Standard Statistics and Poor's Publishing Company.

I first was associated as consultant with Standard Statistics Company in 1928 and in 1931 became associated as a consultant with Poor's Publishing Company and took over the position of executive vice president and general manager which position I held for approximately two years.

I have collaborated on several books in accounting, and I have written a number of articles. Since I have been with Standard Statistics Company and later, Standard & Poor's Corporation, I have asked—I have been asked to make a number of special investigations, some of which related to situations which required presenting my analysis and findings before various courts and commissions including the Federal Power Commission.

Q. Now, Mr. Coffman, have you, at the request of Panhandle Eastern Pipe Line Company made a study of the investors' appraisal of the risks of capital in the natural gas industry as compared with other divisions of the utility industry?

A. I have prepared such a study.

Q. Is the document which I now show you—does that document contain the results of that study?

A. That contains a summary of the analysis.

[fol. 998] Q. And have you, in that connection, prepared also a volume entitled, as I have stated above, but marked volume 2, of statistics supporting data in volume 1, appendices A, B and C?

A. I have prepared that.

Q. Is this document I now show you the document to which you referred? A. That is right.

Q. Were these documents prepared by you, or under your direction?

A. They were prepared under my direction.

Q. And do they, in your opinion, correctly show what they purport to show? A. They do.

* * * * * * * *

(Documents referred to were marked for identifications as Exhibits 63 and 64.)

Q. In this connection, Mr. Coffman, have you also prepared a study dealing with, in general, the economic return requirement of Panhandle Eastern Pipe Line Company? [fol. 999] A. Yes, I have made such study.

* * * * * * * *

Q. Now, in connection with making that study and as a collateral part of that undertaking, did you make the study, the results of which are shown in exhibits 63 and 64 for identification? A. Yes, sir.

Q. Now, will you state first the purpose of that study, and then proceed to outline what you did in that connection?

A. Well, several years ago we undertook to produce a rather elaborate analysis of the investors' appraisal of the risks of capital in a broad industrial grouping.

After we had spent some time on that, it proved that the time necessary to complete the study as well as the cost, made it prohibitive.

At about that time we were retained by the Hope Natural Gas Company to produce such study, but confining it to the public utility division.

We found that that was of such scope we could produce the study within a reasonable time, and on that particular assignment, covered the investors' appraisals of risks re- [fol. 1000] lating to water companies, electric utility operating companies, manufactured and mixed gas companies and natural gas companies.

The results of that study later on were presented before this Commission in connection with the Hope Natural Gas Company.

The Panhandle Eastern Pipe Line Company in August of this year retained Standard & Poor's Corporation through me to make a similar study bringing the various data down to-date and showing the results, the analysis and results being contained in this exhibit, Volume 1.

Q. When you speak of exhibit, volume 1, you are referring to exhibit 63 for identification? A. Yes, sir.

Q. And did you, in that connection, add to your study an examination of the investors' appraisals of risks in relation to natural gas pipe line companies?

A. Yes, we had to expand the study to include the pipe line companies.

Q. May I ask, parenthetically, Mr. Coffman, why you did not include the telephone industry in this study?

A. Well, the telephone industry, we found, was so predominantly covered by the American Telephone and Telegraph Company, and so many of the various individual companies' securities were held by the American Telephone and Telegraph Company, that we could not get sufficient data on market prices and on earnings to produce [fol. 1001] a study that we felt would be indicative of that particular branch of the utility industry.

* * * * * * * *

Q. Now, may I ask whether exhibit 63 for identification presents the findings which have resulted from the investigatio to which you have just referred?

A. Yes, that exhibit contains a full statement of the approach and procedure followed in the study.

Q. And may I ask whether it also contains your conclusions?

A. It contains the conclusions and certain exhibits at the end called "Statements A, B," and etc., which relate to the supporting statistics that were used directly in the computations made in this particular exhibit.

* * * * * * * *

Exhibit 64 contains all of the figures and the working papers that were used throughout this entire study, the

two of them together are everything that we used in this study.

Once we selected the various divisions which I have already enumerated, from the water companies through to the various natural gas pipe line companies, from one place or another, depending upon where we could get the [fol. 1002] most complete list which I shall define later on, we took all the companies that applied to the division.

From that overall list, we made certain eliminations of companies for reasons that are given and which I shall specify later.

Thereby we came down to a group which was used in the study which we believed to be most representative of conditions in that particular division of the utility field.

Once we had those companies established, in order to ascertain investors' appraisal of the risks of capital, we took the earnings of each company that were available for all capital, that is, the earnings that were available to be used for paying interest, preferred dividends, or distributed to common stock and surplus.

We took the various amounts of capitalization that were outstanding, that is, bonds, preferred stocks, common stocks, and got the market quotations on those securities.

We took the average of the high and the low for each of the years studied and there are four years from 1937 through 1940 inclusive.

And the interim period from January of 1941 through August of 1941.

We multiplied the bonds, preferred stock or common [fol. 1003] stock outstanding in terms of issue, that is, number of shares, or thousands of dollars of bonds, by the average of the high and low market price, thereby securing a market appraisal for each of those divisions of capitalization.

Q. And for each of the periods you have mentioned?

A. For each of the years mentioned, and we then added those various amounts for each company together, getting

what we called a total indicated market appraisal of capital.

Then the total amounts for each company were added together for the list of companies that resulted from our eliminations and that gave us the total indicated market appraisal for all those companies. We added the earnings available for capital for each of the companies for each of the years in question, and that gave us the total earnings for that particular group.

We then divided those total earnings by the total market appraisal of capitalization, and that gave us a percentage figure which we said was, or represented the investors' appraisal of risks of capital in the particular division we are discussing.

Now, in this report—

* * * * * * * * *

Exhibit 63, I give an example as to the procedure so that the method will be clearly understood and then this exhibit is broken down as to sections, starting with water companies and going through the natural gas pipe line companies.

[fol. 1004] Q. Now, Mr. Coffman, I wish you would proceed in your own way to explain the data contained in this exhibit so that it may be clearly understood, briefly, explaining each step which you took in this examination.

A. Generally, I have outlined the procedure particularizing it to one company so that it will be specific.

Q. What company do you take for that particularization?

A. I took the Boston Edison Company for the year 1940. It had a simple capital structure and would prove the point without taking up too much space or time.

First, for the years 1937, 1938, 1939 and 1940, the indicated total market value of all the securities of a single company was determined by taking the sum of the amounts produced by multiplying the number of each class of security, that is, bonds, preferred and common stocks as the case might be, outstanding at the end of each year, by the average of its high and low market quotations in that year.

For the interim period of 1941, January-August, both inclusive, the same procedure was followed except that the latest record of securities outstanding and the average of high and low market quotations for the period were used.

. . . . . .

The Witness: Shown on page 6 of exhibit 63, I give [fol. 1005] an example which is captioned, "Indicated Market Value of the Securities Outstanding of the Boston Edison Company for 1940."

Taking the capital outstanding as of December 31, 1940 which is clearly captioned there was capital stock $25 par value in the amount of 2,468,656 shares outstanding.

The 1940 market prices, high and low and the average, were 36 and 3¼, 30 and ¾ths and the average was $33.75 per share.

Multiplying the 2,468,656 shares by $33.75 average price for the year 1940, gave an indicated market value of $83,317,140.

In addition, the Boston Edison Company had first mortgage bonds, 2¾, maturing in 1970 outstanding in the amount of $53,000,000 as of December 31, 1940.

The price of the bonds—$103.53 per bond, which is used for that calculation, was the offering price used since issue was sold on December 10, 1940.

That is clearly shown in the note.

Multiplying the $53,000,000 bonds—dollars worth of bonds, by the $103.53 price, gave a market value of $54,870,900. Adding the two dollar amounts together, gave a total indicated market value for December 31, 1940 of $138,188,040.

Then, as shown in section (B) of the example captioned, "Indicated Market Value of the Securities Outstanding of the Boston Edison Company for the Interim Period of 1941, January-August, Both Inclusive", I follow the same [fol. 1006] procedure showing that there was outstanding the capital stock $25 par, in the amount of 2,468,656 shares.

The interim period, high, low and average price was 34 and 3/4ths, 26 and 7/8ths and 30.69 respectively.

Multiplying the 2,468,656 shares by the average price of $30.69 gave a total indicated market value of $75,763,053.

Following the same procedure with the first mortgage bonds, 2 3/4ths due in 1970, there were $53,000,000 par amount of such bonds, outstanding, December 31, 1940.

In the period January 1 to August 31, 1941, both inclusive, the bonds reached a high of 104 and 3/8ths, a low of 101 and the average was 102.69.

Multiplying the $53,000,000 by 102.69 gave a total of $54,425,700.

Adding this figure to the $75,763,053 gave me a total indicated market value of $130,188,753.

Q. Mr. Coffman, is it a fair statement to say that that example which you have just outlined discloses the method which you have used in each instance, and in respect to each selected period and each selected company in connection with the preparation of this study?

A. This represents exactly the method that is used in each of the cases you have mentioned and applied throughout this report so far as determining indicated market value is concerned.

[fol. 1007] Q. And I take it that you used the high and the low and the average for the year because you deemed that to be a reasonable method of obtaining investors' appraisal of the risks of capital of that period; is that correct?

A. That is correct; yes, sir.

Q. Now, will you state what your next step was?

A. As shown on page 6 of exhibit 63, item 2, next there was determined for the individual company, the total earnings available for distribution to the securities, after taxes, depreciation and all other miscellaneous charges, as reported in the particular company's reports to stockholders.

For the years 1937, 1938, 1939 and 1940, earnings as shown in the published annual reports for the years in question were used.

For the interim period of 1941, January-August, both inclusive, the latest reported earnings covering a 12-months period were used, the dates of which are clearly indicated in the statements at the end of this exhibit, exhibit 63.

Q. Now, you have shown on page 7 of exhibit 63, have you not, by an example taken from the Boston Edison Company, just what you do in that step?

A. That is correct.

Q. Now, what was the next step which you took?

A. In the next step, as shown in item 3, page 7, exhibit [fol. 1008] 63, the earnings so determined under (2) A and B were then divided by the indicated market value of all securities as determined under (1) A and B respectively, and a rate for the period in question was thus obtained.

Q. I wish you would outline by an example just what you did in that step.

A. Following the same example, the Boston Edison Company, for the calendar year 1940, dividing the consolidated earnings available for capital, in the amount of $7,730,837, by the indicated market value of all capital of $138,188,040, gives a percentage of 5.59 percent which, in my opinion, fairly indicates the investors' appraisal of the risks of capital employed in that enterprise for the year 1940.

Q. Did you do the same thing for the interim period, January to August, inclusive, 1941?

A. Exactly.

Q. What was the percentage that you found in that instance?

A. The percentage is shown in (3) B on page 7 of exhibit 63, 5.92 percent.

Q. What was the next step in your study?

A. As shown in section (4) page 7, exhibit 63, having determined in the manner described above, the investors' appraisal of the risks of capital employed in each com- [fol. 1009] pany selected, the indicated market value of the companies in each group, determined under (1) A and B above, was added to obtain the indicated market value of the capital securities of the entire group.

Similarly, the earnings available for distribution to the securities of each of the companies, as determined under

(2) A and B above, were added to obtain the total earnings available for distribution to securities of the entire group.

The latter figure was then divided by the former in order to obtain the investors' overall appraisal of the risks of all capital of the group.

This was done for each of the years 1937, 1938, 1939 and 1940, and for the interim period of 1941, January-August, both inclusive.

Now, in connection with this, the results of such computations for the years 1937, 1938, 1939 and 1940 appear on statements A to E at the end of exhibit 63. Statements A-1 to E-1 present such data for the interim period of January-August, 1941, both inclusive, and the complete working papers, upon which these statements are based are presented in Appendix C of the accompanying book of tables, volume 2 called Exhibit No. 64.

Q. Yes.

Now, in general, does what you have now testified cover in outline form the study which you have thus made?

A. It does.

[fol. 1010] Well, on page 9 of exhibit 63, I present an analysis of the data on water companies, which shows that I first took all of the companies engaging solely in the water business from our Standard Corporation Records and those appear on pages 1 and 2 of appendix A in exhibit 64.

There was a list of 72 companies. From those companies, certain eliminations were made for purposes of this study.

Q. Will you state why you made these various eliminations?

A. Well, there were three main reasons as shown on page 9 of exhibit 63.

(1) Companies whose common stocks were held by one of the larger holding companies, such as American Water Works & Electric Company, the Federal Water Service

Corporation and the Community Water Service Company and whose stocks had no obtainable market evaluation.

Q. You eliminated them, then, because you could not obtain for them the data you needed in connection with developing the study?

A. That is correct.

Q. Did you make other eliminations for other reasons? [fol. 1011] A. (2) We eliminated companies whose stocks were closely held by relatively few individuals and had no available market evaluation.

Q. In other words, you eliminated those companies for the same reason, towit:

That you were unable to obtain the data which you would need to make the necessary study in this investigation?

A. That is correct.

Q. Now, have you made other eliminations?

A. There was one further elimination.

(3) We eliminated the companies whose 1940 gross operating revenues were less than $500,000. This latter class was not deemed of sufficient importance to be included in the study.

Q. Why was that?

A. Well, the companies whose gross revenues were so much smaller or lower than $500,000, we did not feel were representative of the water industry as a whole.

Q. Now, when you got through with these eliminations from the 72 companies which you originally examined, what companies were left?

A. After the eliminations were made from the overall group of 72, there were 7 water companies remaining which were Bridgeport Hydraulic Company, Elizabethtown Water Company, Consolidated, Hackensack Water Company; Middlesex Water Company; New Haven Water [fol. 1012] Company; Plainfield-Union Water Company and Stamford Water Company.

Q. Now, do you consider those companies to be representative of the class in which they fall?

A. Yes, I thought they were entirely representative of the class in which they fell, and further, they are the only water companies, as a matter of fact, that you can find information upon of the size mentioned.

Q. What did you do with respect to those particular water companies?

A. I followed the same procedure as already outlined in regard to the Boston Edison Company.

Q. And have you shown in exhibit 63, the result of your investigation in respect to these water companies?

A. That is correct.

On page 10 of exhibit 63, without going through all the details, details recited in connection with the Boston Edison Company, I give the results of such procedure as it relates to these water companies.

In a table on page 10, exhibit 63, I show that the total indicated market value of capital for 1937 was $79,750,400.

For 1938, $78,545,433.

For 1939, $79,635,529.

For 1940, $83,244,017.

[fol. 1013] And for the interim period, January-August 1941, $81,816,519.

I show the total earnings available for capital for those same years, 1937, $4,410,321.

For 1938, $4,114,060.

Q. Without reading those complete figures, what are the percentages of investors appraisal of risks of capital which you found in connection with these companies during these various periods?

A. The percentages representing the investors' appraisal of the risks of capital were 5.53 for 1937;

for 1938, 5.24 percent;

for 1939, 5.64 percent;

for 1940, 5.13 percent.

For the interim period, January-August, 1941, 5.24 percent.

And the average for the full four years was 5.38 percent, which is given in the text, not in the table.

Now, in connection with that summary table shown on page 10 of exhibit 63, statements A and A-1 at the back of exhibit give the detailed information which I have already recited in connection with the Boston Edison Company and show how the resulting figures shown in the table on page 10 were actually ascertained without going through the details in the text to show it.

Q. Now, in that connection are all the data which you [fol. 1014] used for this particular branch of your study shown in the volume which has been marked exhibit 64 for identification?

A. The exhibit marked 64 contains therein a section called, "Appendix A" and in Appendix A on the first page there is shown a list of water companies from which selections were made to determine investors' appraisal of risks of capital. And there we will find the list of 72 companies which has been mentioned, and will find columnar captions which show the basis on which one or another of the companies were eliminated down to the 7 which we finally used.

Q. All right.

Now, where else in exhibit 64 are the data contained in respect to water companies?

A. Taking Appendix C.

Q. Which is headed "Working Papers Showing the Computation of Investors' Appraisal of Capital", is it?

A. That is correct. Water companies in that section of appendix C of exhibit No. 64 show it.

Q. Beginning on page 1 of that exhibit?

A. Beginning on page 1 and going through—beginning with the Bridgeport Hydraulic Company, showing the detailed information which actually is the information supporting the statement A and A-1 in volume 1, or exhibit 63.

Q. And the first 21 pages of the appendix you have just mentioned contain those data; is that correct?

[fol. 1015] A. That is correct.

Q. All right.

Now, having performed this investigation with respect to water companies, will you now turn to your analysis of the data of electric utility operating companies, and state what you did in that connection?

A. As shown on page 11 of exhibit 63, I have an analysis of the data on electric utility operating companies.

From an alphabetical list of telephone, electric and gas utility common stocks, considered in the course of the study of certain factors influencing investors' appraisals of risk characteristics, carried as schedule 9 of Federal Communication Commission publication issued June 15, 1938, and entitled, "The Problem of the 'Rate of Return' in Public Utility regulation" were selected all electric operating utility companies whose common stocks were outstanding in the hands of the public to the extent of at least 5 percent.

The complete list included 40 telephone, electric and gas companies in the schedule just referred to. From that, we made certain eliminations.

Q. Will you state why you made those eliminations?

A. Well, the eliminations were made from—(1), companies whose revenues were derived primarily from telephone service.

[fol. 1016] Q. You have stated, have you not, why you felt that telephone companies should be eliminated?

A. That is correct.

(2) Companies whose revenues were derived primarily from gas service.

Q. Is that because you have another section of this report dealing primarily with gas companies?

A. That is right.

The gas companies will come from this grouping, as a matter of fact but are classified as gas rather than electric and gas.

Q. And you have made no further eliminations?

A. (3) Companies whose common stock was outstanding in the hands of the public to an extent less than 5 percent.

(4) We eliminated those companies which were primarily holding companies.

Q. Why did you do that?

A. Because we were trying to get the investors' appraisal of risks of capital in operating companies as distinguished from holding companies.

Q. Now, out of the complete list of 40 companies, how many were left after you had made these eliminations?

A. There were 15 electric utility operating companies, remaining.

Q. Are those listed, and will you state what they are? [fol. 1017] A. Those are listed on page 11, exhibit 63.

Q. And 12, are they?

A. 11 and 12. They cover Bangor Hydro-Electric Company.

Boston Edison Company;

Central Hudson Gas and Electric Company;

Cleveland Electric Illuminating Company;

Commonwealth Edison Company;

Connecticut Power Company;

Consolidated Edison Company of New York;

Consolidated Gas, Electric Light & Power Company of Baltimore;

Detroit Edison Company;

Duke Power Company;

Hartford Electric Light Company;

Pacific Gas & Electric Company;

Pennsylvania Water & Power Company;

Southern California Edison Company, Ltd.;

Tampa Electric Company.

Q. Those were the companies which you then studied; is that right?

A. That is correct.

Q. And did you perform the same general investigations with respect to those companies that you explained with respect to the water companies?

A. I followed that same identical procedure, yes.

[fol. 1018] Q. Will you state what were the results of those studies in respect to the investors' appraisal of risks of capital in connection with those companies?

A. As shown on page 12 of exhibit 63, the summary table of basic material and the investors' appraisal of risks

of capital which was the resulting percentage showed 5.47 percent for 1937.

5.52 percent for 1938;

5.42 percent for 1939;

5.46 percent for 1940;

5.61 percent for the interim period, January-August, 1941, both inclusive.

Q. What was the average over the four full years that you studied?

A. The average for the four full years was 5.47 percent.

Q. Now, have you included in your two exhibits that have been marked for identification the supporting data with respect to each of these companies for each of the years studied as well as the total figures for the group?

A. That is correct.

That is contained in statements B and B-1 at the end of this report.

Q. Exhibit 63?

A. Exhibit 63.

And I show the information for each company and the [fol. 1019] indicated market value of capital for each year, the earnings available for distribution to capital for each company for each year and the investors' appraisal of risks of capital which is the percentage for each company for each year, and on statement B-1, I show the same material for each company for each year on the interim period, January to August, 1941, both inclusive.

Q. Yes.

A. And in volume 2, which is exhibit marked 64, I show in appendix A, page 3, the list of electric utility operating companies and others from which selections were made to determine the investors' appraisal of risks of capital which shows the full list of 40 referred to and in columns in our headings, show the method of elimination for whatever reason it might be, which left the resulting figure of 15, which has been considered in exhibit 63, pages 11 to 12.

Q. Mr. Coffman, is it your opinion that the elimination you have made in this section of your study, as well as th eliminations which you have stated were made with respec to water companies, and the eliminations which you are going to explain with respect to the other types of utilit operating companies, are reasonable and necessary elimi inations in connection with arriving at your conclusions

A. I believe that they are.

Q. And, in connection now with these electric com panies, did you include in your final study all of the com [fol. 1020] panies which you believed reasonably repre sentative of the electric industry and as to which you coul obtain the data which was necessary to your study?

A. So far as I know, this is an all-inclusive list on th basis that I have outlined and is fully representative.

Q. And you did not, in any sense hand pick any of th companies you used with respect to any of the companie in these sections?

A. That is correct.

Q. And all of the eliminations were made on the base stated in exhibit 63?

A. That is correct.

Q. Now, have you anything further that you would lik to say with respect to the studies made on electric utilit operating companies?

A. Well, except to emphasize that in this particula study, the source of information used came from th schedule 9 of the Federal Communications Commissio publication. We believed that to be inclusive, and we ha that checked against our own sources and found it to b such and we used that list on the theory that it had alread been tested and had been found to be about as complet as any that could be prepared.

And then went on with the various eliminations as de scribed, to get the final group of companies.

. . . . . .

[fol. 1021] As shown on page 13 of exhibit 63, in makin the data on manufactured and mixed gas companies, her a list was prepared of all operating companies distributi manufactured and or mixed gas from the Standard Co poration Records which appear on pages 4 and 5, appendi A in the exhibit marked 64.

From this list of companies, we made eliminations on the following basis:

(1) Companies whose stocks were controlled completely or practically so, by a holding company and for which there was no market evaluation.

(2) Companies whose gross revenue was predominantly obtained from services other than the distribution of manufactured and/or mixed gas.

(3) Companies with gross revenues in 1940 of less than $1,000,000 because these were too small to have any important bearing on the final results.

Q. Those were all of the eliminations that you made, were they?

A. That is the basis of all eliminations that were made.

Q. Now, after making those eliminations, how many companies did you have left, and what were they?

[fol. 1022] A. There were 10 companies remaining in the grouping.

* * * * * * * * * *

These were the Bridgeport Gas Light Company;

Brooklyn Union Gas Company;

Elizabethtown Consolidated Gas Company;

Hartford Gas Company;

Laclede Gas Light Company;

Peoples Gas Light & Coke Company;

Providence Gas Company;

Seattle Gas Company;

Springfield Gas Light Company;

Washington Gas Light Company.

Q. Now, in determining your figures for the investors' appraisal of risks of capital for these companies, could you follow precisely the same course that you followed with respect to the electric and water companies that you have described?

A. I did, yes.

Q. Now, will you please state what the results were in connection with these gas companies?

A. Well, as shown on page 14 of exhibit 63, we give the total indicated market value of capital for each of the years and the interim period, the total earnings available for capital for each of the years and the interim period, and dividing the total earnings available for capital for each of the years, by the total indicated market value of capital for each of the years, I get the investors' ap-[fol. 1023] praisal of risks of capital which was 6.12 percent in 1937;

6.72 percent in 1938;

6.72 percent in 1939;

6.89 percent in 1940, and

7.04 percent for the interim period.

. . . . . .

A. The average as shown in the text was 6.61 percent.

Q. Is full supporting data for all the figures which you have used contained in exhibits 63 and 64 respectively.

A. Yes it is, and in exhibit 63, on statement (C), I show for each company for each year the indicated market value of capital, the earnings available for distribution to capital, and the investors' appraisal of risks of capital, and in statement C-1 at the end of exhibit 63, I show for each company, the indicated market value of capital, the earnings available for distribution of capital, and the investors' appraisal of risks in capital in percentage form.

Q. For the interim period?

A. Yes, for the interim period.

Q. When you speak of the interim period in your testimony, you mean the period, January to August, 1941, inclusive?

A. That is correct.

Now, in further support of those data in exhibit 63, [fol. 1024] there is shown in Appendix A, pages 4 and 5 of volume 2, exhibit 64, the list of all the operating companies distributing manufactured and mixed gas services as prepared from Standard Corporation Records wherein the entire list covered 85 companies—and it was from

those, that complete list that the eliminations were made, resulting in the final 10 shown.

Q. And, in the data you have just mentioned in exhibit 64, have you shown the reasons for the elimination of each company which was eliminated, and also the list of the companies which were used to determine investors' appraisal of risks of capital?

A. Yes, I have shown that, and in the subsequent tables in exhibit 64, all the detailed information is given on each company.

Q. All right.

Now, Mr. Coffman, did you make a similar study with respect to natural gas companies, and if so, will you outline what it was?

A. I made a similar study of natural gas companies and this is shown on page 15 of exhibit 63.

The list of natural gas companies from which selections were made to determine the investors' appraisal of risks [fol. 1025] of capital for this industry was the same as that prepared by Mr. Charles W. Knapp, Jr., of the Federal Power Commission in an exhibit entitled, "Rate of Return", which was submitted in the Hope Natural Gas Company hearings.

Q. That is a hearing which has been running along for the last two or three years, is that your answer?

A. That is correct.

This list was used since it appeared to be fully representative of the industry.

Mr. Knapp testified that:

"In preparing this list, an attempt was made to include all natural gas companies which had the following characteristics:

"(1) Companies engaged in the production and transmission of natural gas and sales thereof at wholesale and to main-line industrial customers;

"(2) Companies engaged in the transmission of natural gas and sales thereof at wholesale and to main-line industrial customers.

"(3) Companies such as those described in (1) and (2) above which also conduct retail distribution operations.

"(4) Companies so engaged which have annual operating revenues of $2,000,000 or more."

Q. Do you believe that a list of companies determined as so stated by Mr. Knapp would be fully representative of the Natural Gas Industry in general?

[fol. 1026] A. We believe that was an inclusive list.

Trial Examiner: Mr. Coffman, may I ask whether, as you construe Mr. Knapp's basis of selection, his (4) of, qualification or condition, is a limitation upon the other preceding conditions?

The Witness: That is, the companies engaged which have annual operating revenues of $2,000,000 or more.

Well, generally speaking, I would say that wasn't a very great limitation because for the companies that are listed, many of them are of such size that I don't believe that that elimination would—that particular process of elimination would restrict the study to any material extent, so far as results are concerned.

Trial Examiner: You do, however, understand that limitation is to be superimposed upon the other limitations?

The Witness: Yes, I do.

Mr. Wheat: You believe that was a proper limitation as made by Mr. Knapp?

The Witness: I believe it was a proper limitation as I have mentioned, for example, in a prior listing, where we have the manufactured and mixed gas companies, I eliminated companies of $1,000,000 or less, and in the case of water companies, I eliminated companies which had gross revenues of $500,000 or less. I think it is sound to do this on exactly the same basis.

By Mr. Wheat:

[fol. 1027] Q. How many companies were left after Mr. Knapp had made these various eliminations?

A. In this particular case, I show left 13 companies which are listed on page 17 of exhibit 63 and that is taken from a total list of 43 natural gas companies in all.

Q. In other words, Mr. Knapp included 43 natural gas companies, did he?

A. There were in his list, 43 companies.

Q. And would it be fair to state, as stated on page 16 of exhibit 63, the grand total of securities of these 43 companies which you have stated in your opinion are fully representative of the natural gas industry, is $1,181,773,511?

A. I think that is representative, yes.

Q. Yes.

That is the total, is it, of those outstanding securities?

A. That is the total of the outstanding securities of the entire 43 companies which are listed.

Mr. Littman: As of what date, may I inquire?

The Witness: This particular date, I think is, as of December 31, 1940.

. . . . . .

[fol. 1028] Mr. Littman: Isn't it apparently various dates?

I call your attention to Appendix B, page 1, of your exhibit 64, and ask you whether that will refresh your recollection as to what dates were used?

. . . . . .

Mr. Littman: I see dates ranging from, well, one in July, 1940, one in March, 1941, another December 31, 1940.

The Witness: That is correct.

Mr. Littman: And also, December 31, 1939, and so forth.

The Witness: That is correct. The data given in Appendix B on pages 1 to 5, inclusive, on exhibit 64, show for each company the particular date and they vary. There

are some of them at the year's end for 1940 and 1939,—one or two for interim dates.

By Mr. Wheat:

Q. You mean pages 1 to 10, do you not, inclusive of exhibit 64? Appendix B, Exhibit 64?

* * * * * * * * *

The Witness: Pages 1 to 10, that is correct, and as explained in the note at the bottom of each of the exhibits that is taken from the exhibit prepared by Mr. Charles W. Knapp of the Federal Power Commission, in the Hope Natural Gas Company hearing.

[fol. 1029] Mr. Littman: Are those the dates Mr. Knapp used?

The Witness: I believe they are; the ones that were taken from that exhibit.

By Mr. Wheat:

Q. Now, Mr. Coffman, considering these 43 companies, was it necessary for you, in connection with your present study, to make other eliminations, and if so, why did you do so?

A. Well, we did make some further eliminations on the original list, from the 43 companies we eliminated all companies whose common stocks were not outstanding in the hands of the public and for which an investment appraisal of this portion of capital was not obtainable.

After giving effect to these eliminations which are shown in Appendix A, page 6 in exhibit 64, there were 13 companies which remained.

Q. Will you state what they were?

A. These are listed on page 17, exhibit 63.

Consolidated Gas Utilities Corporation;

El Paso Natural Gas Company;

Houston Natural Gas Corporation;

Interstate Natural Gas Company;

Lone Star Gas Corporation;

Memphis Natural Gas Company;

Montana-Dakota Utilities Company;

[fol. 1030] Mountain Fuel Supply Company;

National Fuel Gas Company;

Oklahoma Natural Gas Company;

Pacific Lighting Corporation;

Panhandle Eastern Pipe Line Company;

Southern Natural Gas Company.

Trial Examiner: Referring to Appendix A on page 6 of your proposed exhibit 64.

The Witness: Yes.

Trial Examiner: Is that the list of companies that you have eliminated from Mr. Knapp's studies for reasons indicated?

The Witness: The Appendix A, page 6, shows it.

* * * * * * * * *

The Witness: In exhibit 64, it shows the list that was selected by Mr. Charles W. Knapp in the study that has been already referred to.

Trial Examiner: And in the middle, companies which you have eliminated in your conclusions?

The Witness: Exactly.

That explains the method or the reason for the elimination that I made from the group of 43, which I finally gave as a resulting list of 13 companies shown on page 17 of exhibit 63.

Trial Examiner: Now, you were about to state your reasons for those eliminations; is that right?

The Witness: I stated the reason for the elimination made.

[fol. 1031] By Mr. Wheat:

Q Will you elaborate on that, please?

A. As being the companies whose common stocks were not outstanding in the hands of the public, and for which an investment appraisal of this capital was not obtainable.

In other words, of the various companies that Mr. Knapp included in his list of 43, if we could not find a reliable market quotation on a portion of the common capital stock, then we eliminated that company from the grouping because we could not, you see, get an overall investors' appraisal of the market value and therefore, I did not have the basic figure to make a calculation on.

Trial Examiner: There were no other bases for elimination used by you?

The Witness: No, except just that one—as mentioned, in other words, Mr. Knapp had already listed certain bases of elimination, so I started with what he had, and added only one namely—if I couldn't get an indicated market value for common stock, I had to eliminate that company. I couldn't make my calculations.

By Mr. Wheat:

Q. And having made that particular elimination, you had the 13 listed companies left, did you?

A. That is correct.

Q. Those which you have mentioned?

[fol. 4032] A. Yes.

Q. Will you proceed and state what you did with respect to development of your study as to these gas companies; natural gas companies?

A. Well, I followed the same procedure as outlined at the beginning of each of the preceding divisions, and as shown on page 17, exhibit 62, found by using that method, that for basic facts that there were total outstanding securities of $492,892,522.

That was the total outstanding capital.

Q. That was 41 percent of the aggregate book value of all the 43 natural gas companies?

A. Approximately that, yes.

. . . . . .

The Witness: It is 41 percent according to the figures, one shown on page 16 and the others on page 17 of exhibit 63, the $492,892,522 is 41.7 percent of the aggregate book value of all 43 natural gas companies.

By Mr. Wheat:

Q. Do you believe, therefore, that you had obtained a representative sample of the natural gas industry?

[fol. 1033] A. I felt that I had, yes.

Q. What did you do with respect to these 13 companies?

A. Well, I made some analysis in this particular case to show the distribution of various types of securities, 49.2 percent in common stocks, 14.9 percent in preferred stock, and 35.9 percent in debts, composed of bonds, debentures, notes and advances.

Further, all of the outstanding securities of these 13 companies were not held by the public. Owing to the practice in recent years of selling many senior issues privately, $82,732,500, or 46.8 percent of the total debt outstanding was held by institutions. In such cases it was necessary to estimate the investors' appraisal of this particular portion of the capital.

However, the possible margin of error in making such estimate was very small in view of available data on original offering prices and the subsequent trend of quotations for publicly held securities.

Q. Do you believe that any possible margin of error created by that estimate would be large enough to affect your general conclusions?

A. No. The margin of error would be so small it would have little or no effect upon the final results.

[fol. 1034] Likewise, $11,000,000 or 15.0 percent, of the total preferred stock outstanding was held by affiliated companies. This amount was represented by the two issues of preferred stock of the Panhandle Eastern Pipe Line Company which were outstanding in the name of Gano Dunn, trustee for Columbia Oil and Gasoline Corporation.

Here again estimates had to be made of the investors' appraisal of these particular securities, but the margin of error in making such estimates of stocks calling for a fixed dividend payment, obviously could not be great.

Q. How about common stocks?

A. In the case of common stock, there was $36,316,243 or 15.0 percent of the total book value of common stock of the 13 companies, also held by affiliates.

In no case, however, did affiliated companies own 100 percent of the outstanding common stock of any particular company and therefore, the investors' appraisal of the common stocks as indicated by the record of price quotations on the publicly held portions of the issues were used to determine the aggregate value of all the stock outstanding.

Q. Do you believe that to be a reasonable method in connection with your study?

A. I did. I think it is the only method that can be used in the—in a situation like that.

[fol. 1035] The procedure followed in determining the investors' appraisal of the risks of capital in the natural gas division of the utility industry was that previously described in section 1 above.

Q. And what were your conclusions with respect to the investors' appraisal of the risks of capital in this natural gas industry?

A. As shown on page 19, of exhibit 63, the investors' appraisal of risks of capital was represented by 7.81 percent in 1937.

7.98 percent in 1938;

7.60 percent in 1939;

8.03 percent in 1940; and

8.07 percent in the interim period, January-August, inclusive, 1941.

Q. What was the average for the four full years included in your study?

A. The average for the four full years is shown in the text on page 17.

Q. 19, you mean?

A. Page 19 of exhibit 63 which is 7.78 percent.

Q. Now, are the supporting data in connection with your study of these companies contained in these two exhibits, 63 and 64?

A. Yes, they are.

* * * * * * *

[fol. 1036] All the data that we have to work with is in either volume, exhibit 63 or 64 or the two of them.

Q. Now, Mr. Coffman, in connection with your study of these natural gas companies, did you ever have available data with respect to certain natural gas pipe line companies?

A. Yes.

Q. If so, what were they?

A. Included in this list of 13 natural gas companies which I have been discussing, there were certain pipe line companies, El Paso Natural Gas Company, Interstate Natural Gas Company, Memphis Natural Gas Company, Panhandle Eastern Pipe Line Company and Southern Natural Gas Company.

Q. Well now, Mr. Coffman, it is evident, is it not that since these companies—these five natural gas pipe line companies which you have just listed as being included in the 13 natural gas companies you heretofore listed, eliminations from any all-inclusive list of natural gas pipe line companies had already been made by Mr. Knapp and by you on the basis which you have been describing?

A. That is correct.

Q. Yes.

Now, would it be true, would it be correct to state that these five natural gas pipe line companies, which you have [fol. 1037] mentioned were, in your opinion comparable because their revenues were derived principally from the transportation of gas through long natural gas pipe lines?

A. That would be correct.

Q. In any instance, in connection with these five natural gas pipe line companies, was the ultimate distribution system operated by the pipe line company itself?

A. No, I believe not.

Q. Now, what were the results of using your data and confining it to these five natural gas pipe line companies?

A. As shown on page 20 of exhibit 63, the investors' appraisal of the risks of capital was 9.63 percent in 1937, 9.52 percent in 1938, 8.84 in 1939, 9.55 percent in 1940 and 9.49 percent in the interim period, January-August, both inclusive, 1941.

Q. What was the average for the four full years contained in your study?

A. The average for the four full years is shown in the text on page 20 of exhibit 63 and it was 9.38 percent. There is a footnote shown on that same page which explains the data for Panhandle Eastern Pipe Line Company which shows that it could not be computed for the years 1937 and 1938, since no part of the common stock was outstanding in the hands of the public at that time.

Q. You mean that for those years, you did not, you were [fol. 1038] unable to include such data for Panhandle Eastern?

A. That is correct, yes.

Q. However, you did include such data for Panhandle Eastern in the other years of your study, is that correct?

A. Yes.

Q. All right.

Now, will you state whether, in this connection, you also have made an investigation of the investors' appraisal of the risks of the Panhandle Eastern Pipe Line Company, as such?

A. Yes, sir. On page 21 in exhibit 63, I show the determination of the investors' appraisal of risks of capital of Panhandle Eastern Pipe Line Company.

Q. I notice that, for the years 1937 and 1938, you show no figures and I ask you whether that is because of the same reasons as you have just mentioned in respect to the five natural gas pipe line companies?

A. That is for the same reason, yes.

Q. What did you find to be the total indicated market value of capital, the total earnings available for capital, and the investors' appraisal of risks of capital for Panhandle Eastern Pipe Line Company, for the years 1939 and 1940, and for the interim period, January-August, inclusive, 1941?

A. As shown on page 21, exhibit 63, the investors' appraisal of risks of capital was 8.40 percent.

Q. I would like to have you give us the figures for the [fol. 1039] total indicated market value, and the total earnings available for capital.

A. All right.

As shown on page 21, exhibit 63, total indicated market value of capital was $66,681,674.

The total earnings available for capital in 1939 was $5,601,585, and the investors' appraisal of risks of capital was 8.40 percent.

Q. What are the figures for 1940?

A. Total indicated market value of capital for 1940 was $58,156,283.

The total earnings available for capital in 1940 was $5,761,686; and

The investors' appraisal of risks of capital for 1940 was 9.91 percent.

Q. And for the interim period, January to August, inclusive, 1941, what were the figures?

A. Total indicated market value of capital as shown on page 21, exhibit 63, for the interim period, January-August, both inclusive, 1941 was $64,219,240.

The total earnings available for capital in the interim period, January-August, both inclusive, 1941, was $5,843,430; and the investors' appraisal of risks of capital for the interim period, January-August, both inclusive, 1941 was 9.10 percent.

[fol. 1040] Q. What was the average for the full two years included in this study?

A. The average for the full two years shown in the text on page 21 of exhibit 63 was 9.15 percent.

Q. Now, Mr. Coffman, in connection with this general study, have you included in exhibit 63 a summary of the analyses which you have just outlined?

A. Yes, on page 63 of exhibit—on page 23 of exhibit 63, I show a summary of this study, and opposite that page is a chart numbered page 22 in exhibit 63, which shows the detailed information for each group for the four year aver-

age, 1937-1940, both inclusive, and for the interim period, January-August, both inclusive, 1941.

Now, the figures in tabular form on page 23, which supports the chart opposite page 22, show that the 4-year average, 1937-1940, both inclusive, was 5.38 percent for water companies; 5.47 percent for electric utility operating companies; 6.61 percent for manufactured and mixed gas companies; 7.78 percent for all natural gas companies; 9.38 for natural gas pipe line companies, and 9.15 percent for Panhandle Eastern Pipe Line Company.

The figures for the interim period, January-August, both inclusive, 1941, were 5.24 percent for water companies; 5.61 percent for electric utility operating companies; 7.04 percent for manufactured and mixed gas companies; 8.07 percent for all natural gas companies; 9.49 percent for [fol. 1041] natural gas pipe line companies, and 9.10 percent for Panhandle Eastern Pipe Line Company.

Q. Now, are those figures which you have just been reading the figures which form the bases for the development of the chart which appears on page 22 of exhibit 63?

A. The chart is just a graphic presentation of data shown in the table on page 23, exhibit 63.

. . . . . .

As a result of my analysis, I thought that the one important thing that this analysis indicated was that the investors believed that there is a difference in risk in the different divisions of the utility field which I have covered; namely, water companies, electric utility operating companies, manufactured and mixed gas companies, natural gas companies, and natural gas pipe line companies.

Q. What is the range of that difference?

A. Well, the range in the investors' minds is from 5.38 percent for water companies to 9.38 percent for natural gas pipe line companies as based upon four full year averages and it ranges from 5.24 percent to 9.49 percent based upon the interim period, January-August, both inclusive, 1941.

Q. Well, is it fair to state that, as a result of your study, it is shown that investors appraise the risk of capi- [fol. 1042] tal invested in natural gas companies at ap-

proximately one percent higher in respect to manufactured and mixed gas companies, and from two to two and one-half percent higher than in respect to electric operating utility companies?

A. That is the conclusion that I draw from these data.

Q. And is it also evident from these data that investors in general, consider the risks of capital invested in natural gas pipe line companies to be greater than the risks encountered in other divisions of the natural gas business?

A. They very definitely do, from these figures.

Q. Now, Mr. Coffman, is there anything further you would like to state at this time, with respect to this study?

A. Well, in connection with the data which is shown on page 22, in the graph of exhibit 63 and in addition to showing there is a difference in the risk, and the requirement that the investor has, he has also required over this four year period, that the average yield that he should secure, that is, the earnings, the relationship to independent market price, should be in the range of 9½ percent approximately.

In addition, there is one further point in connection with the study that I attempted throughout the study, to make this purely a statistical analysis. I have no opinions of my own in here. I have taken all the facts that were available on all the individual companies listed, and upon the classifications used, and so far as I am concerned, the [fol. 1043] figures speak for themselves.

They are just the results of an arithmetical computation, once the original totals are accumulated.

. . . . . .

[fol. 1044] Q. Mr. Coffman, have you also prepared a study entitled "Study Relative to Rate of Return on Panhandle Eastern Pipe Line Company"? A. I have.

Q. Is the document which is in the hands of the reporter the study to which you have just referred?

A. Yes, sir, it is.

. . . . . .

(The Document Referred To Was Marked Exhibit No. 65 For Identification.)

* * * * * * * * *

By Mr. Wheat:

Q. Now, Mr. Coffman, will you please state briefly what the general purport and purpose of Exhibit 65 for identification is, then will you outline what you did in [fol. 1045] connection with that study?

A. Exhibit No. 65 contains an analysis which I made in relation to the Panhandle Eastern Pipe Line Company with the purpose of determining the economic return requirement that I thought was necessary for the management to receive to permit them to render efficient service or discharge its public duties and generally maintain its credit position.

In some restatement I will amplify that later, but that is the digested result.

* * * * * * * *

On the next few pages immediately following the page containing my statement of experience and qualifications, I present a synopsis of the history and development of the company. I believe most of such information has already been in as evidence in this particular case.

The actual source of this material, from my own standpoint was the S. E. C. registration statement and statements taken therefrom which appear in our publication [fol. 1046] called "Standard Corporation Records."

It shows as a part of that a map which presents the territory from which the company secures the gas and the mileage it covers and the ultimate consuming areas it serves.

I thought it was necessary for me to have familiarity with those facts before continuing my study, but I don't need to go into that here because it has already been presented.

* * * * * * * * *

Q. Now, will you proceed to state what your approach was to the determination of what you have just a moment

ago denoted as the economic return requirement of this company?

A. Well, over the past several years, while I have been making studies in connection with the investor's appraisal of the risk of capital, I have been trying to explore other data which I thought might be helpful and contribute something to a study of return.

Several months ago my company was, through me, retained to make an analysis for the Pennsylvania Power & Light Company which was to be presented before the Pennsylvania Public Utility Commission.

[fol. 1047] In that analysis I attempted to ascertain what the return, that is, the total compensation, should be to allow the management of that company to operate efficiently, discharge its public duties effectively and maintain its credit position.

In this particular study I have attempted to do the same thing. It occurred to me in the studies that I have made and reviewing the various Commission decisions and court decisions on the subject that in past cases the general approach had been one wherein various qualified people would make thorough studies, some relating to information that could be used for determination of the proper rate base and others were devoting their attention to what could be used as suitable material to form an opinion as to a fair rate of return.

So far as I understand those two things, multiplying a fair rate base by a fair rate of return gives a sum of money which is believed to be a reasonable amount that the company should receive for the service it discharges.

Mr. Littman: May I inquire, is this witness a lawyer?

Mr. Wheat: No, this witness isn't a lawyer, Mr. Littman. I have asked him to explain the basis of his approach to the study he has made. The answer is, no, he is not a lawyer.

The Witness: The dollar amount that was received, it [fol. 1048] seemed to me, was a matter which might be determined if one struck at that particular problem directly, so in this particular study I have taken the point of view that through a thorough analysis of all the data that

is pertinent and important to the subject I could arrive at a figure which, to me, would be an irreducible minimum of compensation required by the management of this company to continue to discharge its public duties and maintain its credit position.

In connection with the Pennsylvania Power Company, the Pennsylvania Power & Light Company, which study I had already made and presented before that Commission, I felt that I was following fairly precisely the various factors underlying a determination of a rate as outlined in the Solar Electric case.

Q. What is that case to which you refer?

A. The Solar Electric case is a case in which an opinion was handed down by the Pennsylvania Supreme Court and in the decision there there was—

Q. (Interposing). Give the reference.

A. 137 Pa. Sup. Court Rep. 325.

Q. All right. Now what was the particular statement of the Court which you felt you were following?

A. Well, I felt there that they outline certain underlying factors which I considered in my study from a [fol. 1049] statistical point of view to arrive at a conclusion. That statement was; "The Courts have held that the return should be reasonably sufficient to assure confidence in the financial soundness of the utility and should be adequate, under efficient and economical management, to pay all the expenses of operation, provide for depreciation; payment of interest and reasonable dividends and for a reasonable amount to be applied to a surplus account, thus insuring the maintenance of credit and enable it to raise money necessary for a proper discharge of its public duties."

Then, of course, there are references to the Bluefield Water Improvement Company.

Q. You are referring to Bluefield Water Works Improvement Company vs. Public Service Commission reported at 262, United States Supreme Court's Reports 679 at 692?

A. That is correct and United Railway & Electric Company vs. West.

In following my study of the Pennsylvania Power case, which is similar to the one here, I tried, statistically to present information on these various factors that are outlined and, so far as I understand the opinions, the same general factors were outlined in the Bluefield case and those are the ones that are the basis of my analysis.

So far as the actual presentation is concerned, it might appear to be a little different or new, but so far as I under- [fol. 1050] stand what I have done, I have followed this as precisely as one could under a statistical procedure, the various factors outlined as being important to this kind of a study in the courts, as I state.

* * * * * * * *

Turning to Chart 2, captioned "Growth of Natural Gas Industry in the United States of America, 1906-1940, Both Inclusive," I show a graph which presents natural gas production as represented by the solid blue line and the domestic and commercial customers as represented by the solid gray line.

* * * * * * * *

[fol. 1051] The Witness: On this graph, of the exhibit, it must be observed that there are two scales, the scale on the left-hand side is in terms of billion m. c. f. production, which goes from 0 to 3.5 billions and relates, of course, to the solid blue line.

The scale on the right-hand side is in terms of millions of customers and runs from zero line to 14,000,000 customers.

The figures for the domestic and commercial customers for 1940 were not available, which explains the fact that one year is missing.

I analyzed these data because I thought it was essential in familiarizing myself with the background of the natural gas industry. I interpret these data to indicate that for a period for 1906 to 1920 there was a growth in the number of domestic and commercial customers and some growth in the production of natural gas.

In 1921 the blue line takes a dip, which to me indicated that the business depression following the last World War had some effect upon natural gas production.

Beginning in 1922 there was a considerable sharper rise in production which lasted until 1929.

In the next three years there was a decline which again indicated that this industry was subject to the fluctuations in the business cycle and beginning in 1933 there was an [fol. 1052] other sharp rise until 1937, followed by a year's dip for the recession that occurred in 1937 and '38 and then in the latter part of 1938 on through '40 another sharp rise, so that to me it indicates that the natural gas industry is still a growing industry, that its greatest and sharpest growth began subsequent to the post-war depression of 1920-22, that that industry is subject to business fluctuations and, therefore, carries risks connected therewith which must be faced by managements of various companies in the industry.

The line representing the number of domestic and commercial customers generally is extended upward, the period from 1922 to 1931 showing the sharpest growth and then some leveling off since that latter year, although still showing an increased number.

Now, in connection with this exhibit there is in the back of the Exhibit 65 a complete set of my statistical data for each exhibit that I shall describe here, the first one being marked as the first table therein "Table for Chart No. 2" and that table is captioned "Growth of Natural Gas in the United States of America for the years 1906 to 1940, Inclusive."

It shows a column for 1906 through 1940. It shows, column 1, the domestic and commercial customers in number, the 1940 figure being marked "not available" and the footnote shows support for what is taken from Moody [fol. 1053] Public Utility Manual 1941, page A 42. Column 2 shows the natural gas production in terms of thousand m. c. f. for the years 1906-1940 and the footnote 2 indicates that those data were taken from the United States Bureau of Mines, Minerals Year Books 1937, page 1062, 1941, page 1030 and each succeeding graph that I talk about is supported by a similar table of statistics properly documented with many sources of information as shown, except two or three charts which are fully complete in themselves and there was no need to duplicate the figures.

Q. In other words, you have included in this Exhibit 65 what practically amounts to your working papers for the development of the charts in question?

A. That is correct, every figure that I used is contained in this book.

Q. By the way, it has just been brought to my attention that you stated that the Solar Electric case was reported in the reports of the Pennsylvania Supreme Court. I think the record should show it was the Pennsylvania Superior Court.

A. I am sorry, I didn't know that I said that.

Q. Now, have you completed your explanation of Chart No. 2? A. Yes, I have.

Q. Now, will you turn to Chart No. 3 and state what is shown on that chart?

[fol. 1054] A. Chart No. 3, in Exhibit 65, captioned "Consumption of Natural Gas in U. S. A., 1919-1940, Both Inclusive," shows on the left-hand side one set of data captioned "Consumption According to Usage," and on the right-hand side data relative to "Consumption of Natural Gas Versus Industrial Production in Relatives; 1935-1939, Equalling 100."

The two different boxes in this one chart carry different scales. The left-hand one carries a scale in terms of billion c. f. from zero to 3.5 and the scale in the right-hand box is in terms of percent, since the figures are all relative, and the scale runs from zero to 160 and 160 or any other percent on that scale is percent of the average for 1935, 1939 equalling 100.

In the left-hand section, showing consumption according to use, the consumption for the years 1919 through 1940 are given in the various classifications, domestic and commercial, miscellaneous industrial, field use and carbon black and various colors represent those classifications; but they are clearly marked and I need not explain each.

Generally I interpret these data to show that there has been a substantial growth in consumption from 1921 through 1940 as shown by the top blackline marked "Total Consumption" but that consumption has been influenced by the business cycle or fluctuations in general business as noted in the dip in 1921, the dip for the years 1930, '31 and [fol. 1055] '32 and the dip shown from 1937 to '38.

The total consumption, of course, has shown a marked growth from 1919 when it was 750,000,000 m. c. f., approximately, to a total in 1940 of 2,670,000,000 m. c. f.

In the right-hand exhibit the solid green line represents consumption of natural gas, excluding field use and carbon black and the solid gray line represents the total consumption of natural gas and the brown line represents the Federal Reserve Board of Industrial Production index for the years 1919 through 1940. We have an estimate of the Federal Reserve index for the year 1941 as shown by the dashed brown line to an estimated figure of 155 of the 1935-39 average equalling 100.

* * * * * * * * *

That average comes from the Federal Reserve Board, the other figures relating to consumption of natural gas and total consumption figures which are given from the sources already mentioned. We made the calculation to reduce them to an index so that they would be comparable with the Federal Reserve and be on the same basis with the Federal Reserve.

These graphs indicate that from 1919 to 1930 the trend of consumption of natural gas, excluding field use and carbon black, and the total consumption of natural gas, followed very closely together and, further, so far as trend was concerned, they followed the index of industrial pro-
[fol. 1056] duction as made up by the Federal Reserve Board.

Since 1930 all three lines, as can be seen, are about on the same level and follow the same general pattern, indicating that the consumption of natural gas is subject to the business fluctuations as they occur.

It shows, also, that in 1940 consumption of natural gas was the highest of any time in the history of the industry, that the industrial production index was the highest in its history and that the estimates indicate conditions considerably beyond anything we have seen in the past.

Q. As far as industrial production?
A. As far as industrial production is concerned.

Now, that exhibit, also, as I have explained, carries a table at the end which is marked "Table for Chart No. 3" captioned "Consumption of Natural Gas in the United States of America for the Years 1919-1940" and the table's figures wherein information was available are given for the years 1919 through 1940, both inclusive, and are specifically marked to indicate that the column 1, which is in relatives, 1935-39 equalling 100 is a computation made by Standard and Poor's Corporation, based on figures that were already supplied from governmental sources.

The column No. 2, grand total, is shown to be United States Bureau of Mines figures from Minerals Year Book, already mentioned, and column 3, which is the Federal Re-
[fol. 1057] serve index, is taken from our Standard Trade and Securities where we reprint that index for public consumption.

Q. Now, is there anything further that you wish to state with respect to Chart No. 3?

A. I don't believe there is anything further than to make the point that I have already made, that the total consumption of natural gas has shown tremendous growth in these years, that it is subject to business fluctuations and, therefore, carries more risk than some other activity which might not be subject to such fluctuations.

The left-hand exhibit shows that the greatest growth since 1929 has occurred in miscellaneous industrial and field use. Other divisions have shown growth, but not in the same proportion.

Q. Now, Mr. Coffman, will you turn to Chart No. 4 in Exhibit 65 and explain what is shown on that chart?

A. Chart No. 4 of Exhibit 65, captioned "Revenue from Natural Gas Consumed in U. S. A., 1919-1940, Inclusive," is divided into sections, the left-hand box captioned "Total Revenue According to Usage at Points of Consumption" shows the total revenue and also revenue according to usage as between domestic and commercial, miscellaneous industrial, field use and carbon black.

That particular chart or section of the over-all chart, No. 4, carries a scale in terms of millions of dollars [fol. 1058] from zero to eight hundred million.

The right-hand division of Chart 4 carries a scale in terms of cents per m. c. f. from zero to 40 and shows the average value per m. c. f. as represented by the solid green line.

This shows that the average value per m. c. f. fluctuated from 21.6 cents per m. c. f. in 1919 to 29.1 cents per m. c. f. in 1922 and then came back to around 21.4 to the 22-cent level wherein it fluctuated until 1931 when it reached about 25 cents.

. . . . . .

Mr. Littman: May I interrupt? Does your term "average value per m. c. f." mean average sales price per m. c. f.?

The Witness: That is the term customarily used by the Bureau of Mines in which it represents the total revenues shown in this chart divided by the "Consumption According to Usage" presented in Chart No. 3 of Exhibit 65, which gives you the average value per m. c. f. of consumption.

By Mr. Wheat:

Q. I take it then the two terms, as far as this chart is concerned, are synonymous. That is, the figures here, the amounts reflected are the sales prices?

A. Yes, that is correct. Of course, the one thing which we know is that this is an average value which covers [fol. 1059] domestic, commercial and miscellaneous industrial, field use and carbon black, some of which have very low prices because they are used directly in the field and others higher prices because they are used by the ultimate consumer and buyer, but it is the over-all average of those things at retail.

The Witness: Except for the two fluctuations indicated by the green line in the right-hand division of Chart No. 4 as occurring in 1922 and again in 1932 the average value, although showing some fluctuations, has kept on a reasonably stable basis, that is somewhere between 21.5 cents per m. c. f. to, say, around 22.5 cents per m. c. f.

Q. Would that indicate to you that the supply and demand were somewhat well balanced over these particular years?

A. It would seem to me that that was the case and the only difference that occurred in the two years here where there were more extreme fluctuations was for the most part accounted for by a temporary shift in the demand due to business fluctuations.

Q. General business fluctuations having their effect upon the demand for natural gas?

A. That is right, in cutting down the demand for gas, either for industrial use or for commercial and residential [fol. 1060] use.

The left-hand division shows, as represented by the top black line, the total revenue and that, of course, shows an increase for the period 1921 through 1940, but also shows that it was affected by business conditions in the same years as was the m. c. f. consumption.

Q. Now, these are, in general, what might be termed retail figures, are they? In other words, they are not figures of pipe line transmission company?

A. No, sir, they are the revenue according to uses based on points of consumption, that is right.

Q. They show, do they not, that the revenue from the rather large use shown in Chart No. 3 for carbon black is a relatively very small revenue? A. That is correct.

Q. And that the same is largely true of the field use?

A. The field use, the largest amount of revenue comes from domestic and commercial and the next largest from miscellaneous industrial.

Q. Now the data on which you have based the material shown on Chart No. 4 is shown on the Table for Chart No. 4, is it not?

A. The table for Chart No. 4 at the end, yes, sir.

* * * * * * * * *

[fol. 1061] Chart No. 5 of Exhibit 65, captioned "Average Revenue Per M. C. F., 1929-1940, Both Inclusive," the exhibit is again broken down into two sections, the left-hand section shows the average industry revenue from natural gas consumed in the United States of America at points of consumption and that particular exhibit is in terms of cents per m. c. f., the scale ranging from zero to 80, and the right-hand division showing the average revenue, Panhandle Eastern versus the industry, the scale

there being in cents per m. c. f. but running from zero to 50.

This merely is a breakdown of information shown in the preceding exhibits to indicate that the average industry revenue of natural gas consumed in the United States of America at points of consumption is lowest for carbon [fol. 1062] black which ranges from 1.9 cents per m. c. f. in 1929 along at a rather level line for some years, but finally declines to 0.9 cents per m. c. f. in 1939. The 1940 figures are not yet available.

The field use shows a little larger revenue but has indicated a decline in the years 1929 through 1939, the figure for 1940 not being available, from 9.7 cents per m. c. f. in 1929 to 4.2 cents per m. c. f. in 1939.

Miscellaneous industrial, which is the next line, shows a clearly marked, general downward trend from 19.7 cents per m. c. f. in 1929 to 16.6 cents per m. c. f. in 1939, the 1940 figure not being available.

Then in the next bracket, which is for commercial, the figures are larger amounts, starting with those first available for commercial of 47.8 cents per m. c. f. in 1930, increasing to 50.4 cents per m. c. f. in 1932 and then fluctuating something under that throughout the years and being 49.2 cents per m. c. f. in 1940.

The domestic, which is the higher rate, shows 67.8 cents per m. c. f. in 1930, an increase to 74.8 cents in 1932 and then a somewhat minor decline through the years to 1940 at which time the level was 73 cents per m. c. f.

The main purpose of this was merely to show that in the various different classifications of usage the rates vary according to type of use and point of consumption and this [fol. 1063] was to familiarize me with those data.

On the right-hand division there is a comparison made of the figures for the total industry, excluding field use and carbon black, at points of consumption as shown by the green line, indicating that there the average revenue varied from 35.7 cents per m. c. f. in 1929 to a higher figure of 40.7 cents in 1932 and then a general decline through the remaining years until it reached a level of 34.7 cents per m. c. f. in 1939. The 1940 figures were not available.

The solid red line shows the Panhandle Eastern Pipe Line Company average wholesale rate for the years in which it was available, beginning with 21.1 cents per m. c. f. for 1934 and increasing gradually to 23.4 cents per m. c. f. in 1940.

Now, it must be borne in mind, of course, that this particular section of Chart No. 5 in Graph 65 for all practical purposes—

Q. You mean in Exhibit 65?

A. In Exhibit 65 is for all practical purposes comparing a wholesale rate, that is the Panhandle Eastern figure with a retail rate which is the figure representing the total industry.

Q. Well, in a sense those are not comparable figures, are they?

A. They are not comparable figures, but since the various gas which is transported and sold by Panhandle [fol. 1064] Eastern at wholesale ultimately gets to the hands of the consumer, I have merely put the two on the same chart to see what the trend was.

Q. Well, Panhandle Eastern Pipe Line Company's average wholesale rate has slightly risen, has it not, during these current years, '34 to 1940?

A. That is correct, yes, sir.

* * * * * * * * *

Well, I think it is chiefly explained by the fact of a shift in the usage on the part of the gas transported by the company, that is as you change the relative proportions of the amount of gas that is used for domestic and commercial or for miscellaneous industrial or field use, and so on, you naturally have an influence on the rate because—

Q. (Interposing) You have shown that the domestic and commercial carries much higher rates, have you not, in the left-hand box on Chart No. 5?

A. That is correct, and I presume that is why the proportion or average here has gone up a little, as that particular division has increased.

* * * * * * * * *

There is a table at the end of Exhibit 65 for Chart No. 5, stating all of the data that was used to prepare the exhibit

and shows that such information was taken by Standard [fol. 1065] and Poor's Corporation from Moody's Public Utility Manual.

. . . . . .

Chart No. 6, Exhibit 65, captioned "Panhandle Sales by States Versus Industry Consumption of Natural Gas, 1930-1940, Inclusive"—

Q. (Interposing) You mean 1934?

A. 1934-1940, inclusive.

This exhibit carries two scales, the left-hand scale which ranges from zero to 90 is in terms of million m. c. f. for Panhandle and the scale on the right which ranges from zero to 1.8 is in terms of billion m. c. f. for the industry.

This exhibit in the band portions which are marked "Total Panhandlle Sales" shows the sales broken down in the states that consumed the gas.

The green portion represents the amount that was taken by Michigan; the orange portion by the State of Illinois; the blue portion by Indiana and Ohio; the yellow for Missouri and the red for Texas, Oklahoma and Kansas.

That portion of the exhibit shows by the top line that [fol. 1066] the sales have increased at a rapid rate from 1934 when it was equivalent to 13,500,000 m. c. f. for Panhandle to 56,400,000 m. c. f. in 1940.

The exhibit also indicates that the service to Detroit increased the company's sales beginning on completion of its service to that city, that is, the completion of the facilities to get gas to Detroit, beginning in 1937, but from 1937 through 1940 the chart indicates that the growth in sales for Michigan have not been as great as has the sales in Indiana and Ohio.

In other words, if one were to make a comparison from the 1937 level in each of the classifications, he would find that there has been a lesser growth in Michigan since the addition of Detroit than has been the growth in the service to the states of Indiana and Ohio.

The exhibit further shows, as represented by the solid brown line marked "Industrial Consumption Exclusive of

Field Use and Carbon Black," that the consumption in the industry rose from 981,000,000 m. c. f. in 1934 to 1,598,000,000 m. c. f. in 1940.

However, the growth shown for the industry was exceeded by the growth shown by Panhandle Eastern because if one compares the line marked "Total Panhandle Sales" with the line marked "Industry Consumption," you can observe that there is a narrowing of the gap as you pro-
[fol. 1067] ceed from 1934 to 1940, which indicates to me that Panhandle Eastern Pipe Line Company has shown a more rapid growth than has the industry as a whole.

Q. You have included, have you not, a table showing the detailed figures from which you prepared Chart No. 6?

A. Yes, sir, that is marked "Table for Chart No. 6" presented at the end, included in the table of statistics at the end of Exhibit No. 65 and shows the various sources from which the information was taken.

* * * * * * * * *

Q. All right, now is there anything further you wish to state about Chart No. 6?

A. I don't believe there is, except that an observation can be made that is of some interest in regard to Panhandle sales; that whereas, as shown in a preceding exhibit, there were fluctuations caused in the industry generally by fluctuations occurring in general business,—and that is shown in the line marked "Industrial Consump-
[fol. 1068] tion" for the period '37 and '38,—Panhandle Eastern at no time in its total sales showed any decline, although there was a slight leveling off which indicated to me that perhaps the management had been very alert in operating its business and holding it or at least it fared better, we will say, than other units in the industry.

Q. Yes.

Now, will you turn to your Chart No. 7 and state what is shown by that chart?

A. Chart No. 7 in Exhibit 65, captioned "Trends of Gross Revenue, 1934-1940, Both Inclusive, Panhandle Versus Other Pipe Line Companies and Industry," is shown here in terms of relatives, 1934 equals 100. The purpose of doing that was because the figures for the industry

and for other pipe line companies were so much larger than those for Panhandle Eastern that the only way to show comparability as to trend was to reduce all the series to relatives and start from a common point, which in this case was 1934 equalling 100.

In this case the Panhandle Eastern Pipe Line figures are represented by the red line and show this tremendous growth in gross revenue from 1934 through 1940, representing an increase of 344 percent over the 1934 level.

That compares with figures for total other pipe line companies which increased 91.3 percent of the 1934 level and the figures for total industry which increased 38.7 [fol. 1069] percent for 1939 over the 1934 level. The 1940 figures were not available for the industry.

This exhibit also shows the point I have just made, that the revenues for Panhandle Eastern, although slowed in one or two places by fluctuations in general business, never showed a decline, whereas the industry as a whole and total other pipe line companies did show declines where there were marked recessions in general business.

Q. Have you in your table for Chart No. 7 shown the actual data for other natural gas pipe line companies?

A. The table for Chart No. 7 appearing at the end of Exhibit 65 shows the trend of gross revenue for Panhandle Eastern Pipe Line Company, for the other pipe line companies and for the natural gas industry as a whole and those other companies included Cities Service Gas Company.

Q. About how much did that rise?

. . . . . .

A. I can give it to you in percentage, it was 44.32 percent higher in 1940 than in 1934.

Q. And as contrasted with 344 percent for Panhandle Eastern? A. That is correct.

[fol. 1070] Q. Now, what about El Paso Natural Gas Company?

A. El Paso Natural Gas Company showed an increase from 100 percent, that is the 1934 figure, to 314.34.

Two hundred fourteen percent higher than the '34 figure.

Interstate Natural Gas Company, Inc., showed an increase of 71.29 percent in 1940 above the 1934 figure.

Memphis Natural Gas showed an increase of 87.15 percent greater in 1940 than in 1934.

Mississippi River Fuel Corporation showed 85.03 percent higher in 1940 than in 1934.

Northern Natural Gas Company showed 100.84 percent higher in 1940 than in 1934.

Southern Natural Gas Company showed 200.88 percent higher in 1940 than in 1934.

The total other pipe lines showed a 91.30 percent higher than in 1934 and the total for the industry shows 38.68 percent higher in 1939, the 1940 figure not being available, than the figure in 1934.

Q. Now, what, in general, do these data show, in your opinion?

A. Well, they show pretty conclusively to me that the industry has shown some additional growth in 1934 through 1939; that other pipe line companies which have [fol. 1071] been mentioned show a growth somewhat larger than the total industry in the period 1934 through 1940, but that the Panhandle Eastern Pipe Line Company shows a tremendous growth in that same period when compared to either the total industry or the other pipe line companies, so that there, again, I think that, and I use these statistics and this chart to indicate to me that the management of the company must have been alert during this period in seeking new markets and selling its gas.

Q. Is there any indication in these data or this chart that this growth on the part of Panhandle Eastern Pipe Line Company has come to an end?

A. I see no evidence of that at all at the moment, no.

Q. On the contrary, the trend would appear to be distinctly upward on a rapidly rising line, would it not?

A. From these data it seems to me that that is a logical conclusion.

* * * * * * * * *

[fol. 1072] In Chart No. 8, Exhibit 65, captioned "Operating Ratio of Panhandle Compared with Other Pipe Line Companies, 1934-1940," this exhibit is again divided into two sections, the left-hand section showing figures before taxes, the right-hand figure showing after taxes and both divisions being on a scale in percent of gross revenue, the scale running from zero to 80.

In the left-hand section before taxes, I show that the operating ratio for other pipe line companies was 58.9 percent in 1934 and gradually declined to a level of 51.3 percent in 1940.

The figures for Panhandle Eastern Pipe Line Company represented by the solid red line showed a decline from 58.2 percent in 1934 to 38.5 percent in 1940.

Q. This is before taxes, is it not?
A. This is before taxes.
Q. Yes.
A. Now, that exhibit indicates to me that here, again, the management of Panhandle Eastern is an efficient management because its operating ratio has not only shown a very favorable turn in the period mentioned, but is substantially below the average for the industry.

[fol. 1073] In other words, in 1940 it is a comparison of a ratio of 38.5 percent to gross for the Panhandle Eastern Pipe Line Company as against 51.3 percent for other pipe line companies, which indicates to me, fairly clearly, that there is an efficient management operating the company when contrasted with other pipe line companies as a whole.

Now, the right-hand division, however, shows a matter of further significance because that graph considers the same factors except that they are computed after taxes and here we see that for other pipe line companies the ratio was 65 percent of gross revenue in 1934, showed a slight decrease up until 1937 when after that time it began to increase and in 1940 was 66.7 percent.

Now, that represents, when contrasted with the trend on the left-hand side, the full effect of taxation upon gas pipe line companies, and I emphasize that because taxation, after all, is without the control of the managements and

they are subject to it and must pay it, regardless of their efficiency or inefficiency.

Now, in the case of Panhandle Eastern Pipe Line Company, as shown by the solid red line on the right-hand side, the ratio fell from 67.1 percent of gross revenue in 1934 to approximately 50 per cent in 1937 and, thereafter, showed an increase reaching 57.8 percent of gross revenue in 1940, so that one can see, if you would convert this in-[fol. 1074] formation to a different basis, that in most of the cases apparently the gross revenues of the individual companies and Panhandle Eastern Pipe Line Company have been able to absorb tax increases but the net operating revenue has not.

In other words, the additional increases of taxation at this point are definitely continuing to eat into net operating revenue in spite of the fact that most of these companies are showing considerable growth.

Q. Is it known at the present time that taxes for 1940 and '41 would be higher than for 1940?

A. Yes, I think that so far as 1941 is concerned, the Revenue Act is already out and actually I believe it is in preparation now, being considered, the factors that would be influencing taxation for 1942.

* * * * * * * * *

[fol. 1075] Mr. Littman; Mr. Coffman, do the operating expenses which are reflected on your Chart No. 8 and in Tables 1 and 2 for Chart No. 8 include annual allowances for depreciation?

The Witness: Yes, they include that item.

* * * * * * * * *

By Mr. Wheat:

Q. Now, will you turn to Chart No. 9 and state what is shown on that chart?

A. On Chart No. 9 of Exhibit 65, captioned "Trend of Revenue and Expenses of Panhandle Eastern Pipe Line Company, 1934-1940, Inclusive," this chart is divided into four boxes, Box 1 showing gross revenue in the upper left-hand corner, Box 2 showing operating expenses before taxes in the upper right-hand corner, Box 3 showing

taxes; which is in the lower left-hand corner, and Box 4 showing net operating income after taxes in the lower right-hand corner.

These various boxes show two things; first, the left-hand scale in each case is in terms of millions of dollars, but in the case of the operating expenses, in the case of taxes, in the case of net operating income after taxes, there is a second scale which is in terms of percent of gross revenue, so that one, again, has to interpret properly the scales to be sure they are relating the proper scale to the [fol. 1076] proper item.

The gross revenue as shown in Division 1 in the upper left-hand corner, indicates that there was an increase from $3,000,000 in 1934 to thirteen and a half million dollars, approximately, in 1940.

It can be seen that the point I have already made is actually true, namely, that although the company's growth in revenue was on one or two occasions slowed by business recessions, at no time did they show an actual decline in the period 1934 through 1940.

The operating expenses before taxes represented by the red bars in the upper right-hand box show that they increased from approximately $1,800,000 in 1934 to $5,200,000, approximately, in 1940. There has been there an increase in each year, notwithstanding some slowing down of gross revenue in 1938 because of the business recession.

The solid red line in that same box represents the percentage of the operating expenses to gross revenue, repeating the figure already given of a decline in that figure or operating ratio from 58.2 percent in 1934 to 38.5 percent in 1940 and there the percentage scale is given on the right-hand side.

The lower left-hand box, representing taxes, shows an increase in taxes each year from $270,000, approximately, in 1934 to $2,610,000 in 1940 and, percentagewise, to gross [fol. 1077] revenue, that represents an increase from 8.9 percent in 1934 to 19.3 percent in 1940.

Now, this, of course, merely supports the statement that I gave earlier in interpreting the figures before and

after taxes and the operating ratios, that the increases in taxes are such that in spite of substantial increases in gross, the increases in net operating revenue are going up in less proportion, because taxes are taking a higher percentage.

In the lower right-hand box is shown the net operating income after taxes, showing here $1,000,000, approximately, for 1934, showing that the net operating income did decline by contrast with an increase in gross in 1938 because of the tax situation and it increased to $5,700,000 in 1940; in percent of gross it rose from 32.9 percent in 1934, that is the net operating income rose from 1934 to a higher level in 1937 and then began to decline, reaching 42.2 percent in 1940.

Q. What does that show, in your estimation?

A. Well, it shows fairly conclusively that as the gross revenue and the net operating revenue before taxation of the Panhandle Eastern Pipe Line Company continues to grow, a part of the revenue, and a larger part, is to be consumed by taxation according to the trend as shown in the lower left-hand box and, therefore, that has to be con-
[fol. 1078] sidered, it seems to me, pretty seriously in a case of this sort because the Government will be taking out a certain proportion in taxation which definitely now will be coming out of net income.

* * * * * * *

Chart No. 10 in Exhibit 65, captioned "Percent Earned on Invested Capital of Panhandle Based Upon Capital Structure." This chart is divided into two parts. The left-hand section shows invested capital, broken down as to net debt, preferred stock, common stock and surplus and that particular division is in terms of millions of dollars in a scale that ranges from zero to 80.

The right-hand division shows operating income, the bars representing net operating income and the solid red line representing the percent earned on invested capital, the scale running in terms of millions of dollars from zero to 10.

These figures are taken from the annual reports, the computation of percentage being our calculation of re-

[fol. 1079] lating net operating income to invested capital, both of which figures appear in the annual report to stockholders.

In the left-hand section it is shown that invested capital as represented by total capitalization rose from $44,900,000, approximately, although irregularly, to $59,400,000 in 1940 and the last bar in that section shows the average figure of invested capital for the period 1934-1940, both inclusive, at an amount of $52,100,000.

Now, I might say in connection with that exhibit, as is shown clearly in the table supporting, which is marked "Table for Chart No. 10" at the end of Exhibit 65, we have computed the invested capital herein on the basis of using the net debt. In other words, that is the gross debt minus the various discount commissions and financing charges that were involved and the purpose for that was that in arriving at invested capital we believed that it was the only sound accounting procedure to use, which was to compare the figure with the actual amount of cash the company received and was invested in the business as against the gross figure, part of which was used to pay someone else for the services they rendered in making that item.

Trial Examiner: May I ask whether the computation included any invested capital of the subsidiary companies?

The Witness: This is the consolidated statement as shown in the annual report.

* * * * * * * *

[fol. 1080] By Mr. Wheat:

Q. Well, Mr. Coffman, it includes any subsidiaries owned by the company during any of the particular years shown.

A. That is correct. If I had reviewed the history of the company, I would have stated there how the company was formed and what happened from one period to the next.

Q. You have that included in the first pages of this exhibit, have you not?

A. That is included in the full statement captioned "Synopsis of the History and Development of the Company" in the exhibit and the figures are the figures then

taken from the annual reports for each of the years shown or the registration statement which would give a figure. In other words, the first annual report actually, I believe, was prepared by the company in 1935, but in the '36 annual report figures were given for 1936. The '34 figure was one which was taken from the registration statement. All the other figures are directly from annual reports.

In the right-hand division of Chart No. 10 I show that the net operating income, which is represented by the red [fol. 1081] bars, increased from approximately $1,000,000 in 1934 to $5,700,000 in 1940 and show in the last bar in the division that the average for 1934-1940, inclusive, was $3,700,000, approximately.

The comparison of the operating income, as shown by the red bars in the right-hand division, with the trend of the bars in the left hand, year by year, give the calculation which is captioned "Percent Earned on Invested Capital" and is represented by the solid red line which shows that the percent earned on invested capital, by this total capitalization method of computing invested capital, ran from 2.24 percent in 1934 to 9.62 percent in 1940 and that the average for the years 1934-40, both inclusive, was 7.11 percent.

Q. Now, you have shown all the data on which you based your Chart No. 10 on the table for Chart No. 10, have you not? A. That is correct.

. . . . . .

Mr. Littman: I just wanted to ask you as of what date are these years shown on table for Chart No. 10?

The Witness: December 31, 19—whatever it was, of each year.

. . . . . .

[fol. 1083] By Mr. Wheat:

Q. Mr. Coffman, will you turn to Chart No. 11, of Exhibit 65, and state what is shown upon that chart, and I think you could, by outlining in general and rather briefly, what is shown on these various charts and pos-

sibly proceed without quite as much detail as we have been having, although I do wish your would explain carefully each chart.

A. Chart Number 11 in Exhibit 65, captioned "Per cent earned on invested capital of Panhandle, based upon net property, intangibles and working capital," purports to show exactly the same information as shown in Chart No. 10 of Exhibit 65, except that in Chart No. 11, invested capital is defined as net working capital and intangibles, including the gas sales and purchase contracts, and the net property after reserves.

. . . . . .

The only difference is that in chart number 11, invested capital is based upon the property accounts, whereas in chart number 10, it was based upon the total capitali- [fol. 1084] zation of the corporation. So far as the figures are concerned, the average invested capital for the period 1934-1940, both inclusive, is $52,070,680. There was no change in that. There were a few minor changes in individual years, but it didn't change the average.

Q. Well, the percentage earned on invested capital is the same?

A. The average return on invested capital is 7.11 per cent for 1934—the 1934-1940 period, which is identical with the figures shown on Chart 10. I merely put it in both ways so there would be no question about selecting total capitalization, or property account.

Q. Now, and the detail of the figures from which chart number 11 is shown on the table for chart number 11, is it not?

A. That is correct.

. . . . . .

Q. Mr. Coffman, will you turn to the table for chart [fol. 1085] number 11, and state where you obtained your figures for intangibles, and what those intangibles include?

A. Well, for each of the years, 1934 through 1940 inclusive, there is shown in the table for chart number 11 the detailed items which were included in the total figure shown in chart number 11 for the calculation of the total invested capital.

Now, among the items are property, plant and equipment, less retirements, renewal, depreciation and amortization reserve, thus showing the net property, plant and equipment account; the intangibles, including gas sales and purchase contracts, for 1940, were listed at $2,051,434, and then there was in addition current assets, less the current liabilities, leaving the net working capital, which is shown in the table.

Now, I do not have as a part of the exhibit, the list of the various gas sales and purchase contracts, but such material was taken directly from the company's annual report, and is the amount which is therefore carried.

Q. And which is reported by the company for that item?

A. That is correct, for each of the years shown.

Q. You have simply taken the data shown on that report, and used it in the manner shown in the table for chart number 11, is that right?

A. And I might amplify that to say that throughout [fol. 1086] that entire study, that all the figures that I am talking about in that study either come from a recognized source, such as the Bureau of Mines, or Commercial and Financial Chronicle, or any quotations from recognizable sources, and all figures came directly from the annual reports.

I have had no figures given me directly by the management.

Q. Yes. You have made this study fully and completely as an independent study?

A. From the investors' point of view, using the sources available to the investors, in making such a study.

Q. And finding these figures in the annual report of the Company, you have used them, as shown on chart number 11, and on the table for chart number 11?

A. That is correct.

Mr. Littman: And you have not adjusted those figures in any way?

The Witness: I have not adjusted them in any way except where I have already commented, in one chart, for instance in calculating invested capital, we said we used

the net, which means we took the gross, minus the cost involved, to get net debt, because I think that is proper accounting—the proper accounting method of getting the invested capital.

And in another case, I have shown, and we will come to it shortly, a figure as reported, and then as I adjusted it, but all such adjustments are clearly marked, and the only [fol. 1087] one I recall mentioned up to date is the one about net debt.

Mr. Littman: Is the same thing true with all your exhibits; to wit, Exhibits 63, 64 and 65?

The Witness: The statement is correct that throughout all the exhibits, marked 63, 64 and 65, the information used therein has been taken from reliable sources, and has been clearly documented throughout, and we have not adjusted any figure, unless it is absolutely specified in the exhibit.

Mr. Littman: And that is true, is it, of the earnings figures which you have shown in these three exhibits?

The Witness: That is true, until such time as I indicate a change.

In other words, if there is no footnote or caption to the effect that there has been a correction, or alteration, they are as reported from the source to which it was attached.

By Mr. Wheat:

Q. Now, I think, unless you have something further to say with respect to chart number 11, we may start with chart number 12.

. . . . . .

A. Chart Number 12, in Exhibit 65, captioned "Return to common stockholders of Panhandle Eastern Pipe Line —1934-1940", is divided into three boxes. The one in [fol. 1088] the upper left hand corner shows investment represented by common stock and surplus, and is given in terms of millions of dollars, with a scale from zero to 40.

The upper right hand box captioned "Dividend return to common stock holders," is in terms of millions of dol-

lars, with a scale range from zero to 3, and the lower box captioned "Per cent return to common stock holders," is in terms of per cent with a scale from zero to 10.

As shown in the upper left hand box, investment represented by common stock and surplus, increased from $17,130,094 in 1934 to $28,107,142 in 1940.

The average of such investment for 1934-1940 inclusive, was $21,818,994.

The particular division shows a general increase throughout the various years.

In the upper right hand box captioned "Dividend return to common stock holders," it is shown that there were no dividends to common stock holders in the years 1934, 1935 and 1936.

In 1937, a dividend totalling $364,326 was paid.

In the next three years, dividends were paid, but depending upon how one interpreted the declaration, we get an adjustment in the figures.

For instance, in 1940, in January, approximately the 15th as I recall it, a dividend was declared and I interpreted such declaration then to be based mostly on, or [fol. 1089] practically entirely on the 1939 earnings, and not what had happened in the year 1940.

So if I adjusted the dividend declaration of $1.50 and put it back in 1939, as against 1940, the 1939 dividend would have been the red bar plus the dashed part on top, making a total of $2,340,000 altogether, as against $1,130,000 which is shown at the top of the red bar, which was the actual amount paid in the year 1939.

Naturally, if that adjustment is made for the 1939 figure, then the 1940 figure would be adjusted by a like amount, so that the dividend which actually totalled $2,420,000 was adjusted for the $1.50 declaration in January, and the total then paid would have been $1,210,000.

However, I don't attach any importance to that figure, one way or the other, except to note it is rather odd to have a declaration in January of a given year, unless it

really applied to the earnings in the preceding year. It wasn't due to current earnings.

Q. In any event, it has no particular significance, except that it created a problem as to which year to put it in?

A. As to which year it should be allocated to. As far as any figures are concerned, looking at the average for 1934 to 1940, it will show there a $790,000 payment per annum average for the period which, of course, washes out this adjustment anyway.

[fol. 1090] Then, merely converting the two sets of figures presented above to a per cent as shown in the box presented below, captioned "Per cent return to common stock holders," I show that the average return to the common stock holders in terms of per cent in the year—in the period 1934 to 1940, was 3.64 per cent.

Now it shows clearly in this exhibit that that portion of the capital supplied to the company which came through sale of common stock, that the purchasers of such stock received no return whatsoever in 1934, 1935, and 1936 and that for the entire period 1934 through 1940, they have to date received in dividends a sufficient sum to show them a yield return of 3.64 per cent.

Q. On the average?

A. On the average, which would indicate to me that a person investing [their] money in this particular type of risk might be willing in their purchase to tolerate a period of waiting for dividends, but certainly expects for the investment of that capital on the average to have a better yield than 3.64 per cent because that is not much better than what a first-class bond is selling for at the present time, and certainly the risk of such stock is much greater.

Q. As is shown particularly on your other study of investors' appraisal of risk?

A. Shown therein, and also later on in this study.

. . . . . .

[fol. 1091] Chart 13, Exhibit Number 65, captioned, "New Tax Bill will Reduce Income Sharply, Computations based on Operations—12 months ended June 30, 1941."

In this particular exhibit, or chart, I took the most recent 12 months, as can be seen, to bring it down as close to the date of this analysis as I could make it.

The gross revenue for the 12 months ended June 30th, 1941, was $14,336,448. The net operating income before taxes were $8,823,092.

At this point, I make an adjustment on the figures, which is clearly indicated in Chart Number 13 of this Exhibit 65.

The next two bars, captioned "Taxes," I show the taxes based upon the Second Revenue Act of 1940 in the amount of $3,008,117. If the taxes are recomputed on the basis of the Revenue Act of 1941, and that is certainly the basis upon which the taxes will be paid, the total tax would be computed at $4,[illegible]017.

The net operating income, therefore, has to be adjusted in line with the tax computations. The vertically hatched [fol. 1092] bar on the left-hand side, showing "Net operating income," shows $5,814,975.

Q. After taxes?

A. After taxes, based upon the Second Revenue Act of 1940.

But the other bar showing $4,811,075 is the net operating income figure after applying the Revenue Act of 1941, which again is the figure which will be used.

Q. That is the figure that would have to be used?

A. That is correct, yes.

Now, that is all based upon information again taken directly from the annual report, to get the current picture before us.

Q. Now, Mr. Coffman, when you say that is the figure that has to be used, the tax liability under the Revenue Act of 1941 has already become applicable, has it not?

A. That is correct.

. . . . . .

It is obvious from the figures that I have discussed that the difference in taxes in one year, between the time the Sec-

ond Revenue Act of 1940 came out, and the Revenue Act of 1941, that it makes a difference of approximately $1,000,000 right now increase in taxes on this Company, which [fol. 1093] is a further support of the observation that I made this morning, that although the gross revenue of this company continued to go up, its taxes go up and eat into the net operating income, and there is to be a continued reduction in that, and it seems to me that is important in a study of this kind, because I don't believe that rate reductions could be continued at the same time tax rate increases were being continued, without there being a line some place that would have to be drawn, where you couldn't go any further with those two trends.

Chart No. 14, Exhibit 65, captioned, "Per cent earned on invested capital of Panhandle Eastern Pipe Line Company as of June 30, 1941," shows on the basis of the property and intangibles, that the invested capital as of June 30, 1941 totals $61,216,031, as shown in the Company's report.

Now, that particular total figure was made up of net property, $54,690,591, net working capital $4,661,875, and intangibles, $1,863,565.

The net operating figure shown in the next two bars are the same as those presented in Chart No. 13 of Exhibit 65, showing $5,814,975 at the 1940 rates, and $4,811,975 at the 1941 rate.

Q. What does the change of the application of the latter figure make in the per cent earned on the invested [fol. 1094] capital?

A. Well, it makes a decline of about 1½ per cent.

Q. What are the figures with respect to per cent earned on invested capital?

A. The per cent earned on the invested capital on the basis of 1940 tax rate would be 9.50 per cent, and that percentage is reduced when you apply the 1941 rate to 7.86 per cent.

Q. Again, I ask, is it necessaary to apply the 1941 rate?

A. It is necessary to apply that rate.

Now, these charts, both numbers 13 and 14, in Exhibit 65, are again supported by tables at the end of Exhibit No.

65, marked "Tables for Chart No. 14" and table for Chart No. 13.

* * * * * * * * *

Chart No. 15, Exhibit No. 65, captioned "Per cent earned on invested capital of Panhandle Eastern Pipe Line Company, as of June 30, 1941," but here the invested capital is determined by the total capitalization of the company as against the net property and working capital.

Invested capital on this basis, as of June 30, 1941, totalled $61,423,853, which was represented by net debt of $21,165,558, total preferred stock $11,000,000 and total common stock and surplus of $29,258,295.

[fol. 1095] Again, computing the net operating income at the 1940 rates, we have $5,814,975, and giving effect to the 1941 tax rates, the net operating income is $4,811,075.

Q. What are the per cents earned on invested capital?

A: The per cents earned on invested capital, based upon the 1940 tax rate, is 9.47 per cent, and giving effect to the 1941 rates, is 7.83 per cent.

Mr. Littman: May I inquire, the new tax rate that you speak of, does not apply to the last six months of 1940, does it, Mr. Coffman?

* * * * * * * * *

The Witness: What I have done is this, the figures that I have are net operating income for the last and closest twelve months, which is the twelve months from June 30, 1940 to June 30, 1941, and the way the earnings of the company are now going, it would appear that that was at least a conservative figure, or that the earnings for the full year of 1941 wouldn't be less, so the tax figure I have is conservative. If the earnings are higher, I will apply the 1941 rates and the rates will be higher, therefore the deductions for taxes will be greater.

Mr. Littman: You wanted to show what the effect would be if the present rate was applied to the last half of 1940, [fol. 1096] as well as to the first half of 1941?

The Witness: No, I wouldn't say it that way. What I am really trying to show is, if you had a set of earning fig-

ures of a certain amount for a twelve-months' period, which we actually have, and you apply to that period the 1940 rates, you get a figure. If that is a basis of comparison, you apply the 1941 rates. That shows the effect of the increased taxation immediately. I could have used a hypothetical situation, but this shows that on the same basis, the same base earnings figures, just by applying the 1940 and 1941 rates you increase your taxation $1,000,000 so that it seems to me that it is one hundred per cent comparable and accurate.

By Mr. Wheat:

Q. And conservative rather than otherwise?

A. It is necessarily conservative.

* * * * * * * * *

Trial Examiner: I wonder whether your tax figures, prospective taxes, is in any way affected by the present high rate of earnings, and would be modified if those earnings were, through this proceeding, or for any other reason, reduced?

[fol. 1097] The Witness: Well, it seems to me there are necessarily two components to the problem.

You have in the first instance the base which is the taxable earnings base, from which to make a computation. Now, if that base should change, and if the two rates remain the same, it will necessarily be a change in the resulting figure, so if you reduce the earnings, and apply the same rates, the tax, the aggregate would be less.

On the other hand, if the earnings were greater, the taxes remaining the same—the tax rate remaining the same, the tax would be greater.

In the particular comparison here, since I am using the 1940 and 1941 rates, those two, for purposes of this study, they remain static, so that the only change for the moment you could get would be in the earnings changed, but in that connection, I think that it is important to note, as I have shown, I thought fairly clearly in one of the preceding charts, in Exhibit 65, the figures indicate as shown, for instance, on chart number 9, that the tax rates are getting to a point where although you have an increase in gross, the

tax very definitely eats into net, so I come to the conclusion from that combination of circumstances, that you can't continue to have increasing tax rates and lowering of income without arriving at a point where the Company could no longer maintain its efficiency or its credit. It seems to me impossible.

* * * * * * * *

[fol. 1099] Mr. Littman: Do you mind if I ask one more question here, to clarify the situation in my mind?

Do these taxes to which you refer in these tax charts include all excess profits taxes levied by the Federal Government for National Defense?

The Witness: The figure for 1940 is the only one which includes a Federal Excess Profits Tax for an obvious reason.

The other years include the Federal Income Taxes, the State or Local and Miscellaneous Federal Taxes.

Now, in regard to the table for chart Number 9, which I have already explained, reference to that will give some answer to the question asked in regard to the breakdown of taxes.

In that table, I have a tax item broken down as to State, Local and miscellaneous Federal, and it shows from 1934 to 1940 an increase from $270,204 to $612,872.

That is just using round figures here for the moment, and it is a little better than two times, 200 per cent.

* * * * * * * *

[fol. 1100] The Witness: Federal income taxes were not reported until earnings were sufficient to make it eligible for payment of $230,000 in 1936, and $1,436,598 in 1940, and in addition to which there was paid the Federal excess profits tax of $561,000.

Trial Examiner: That necessarily is because the earnings of the Company were about 9 per cent during that same period, is that not true?

The Witness: That is true, because it qualified under the Act, under a certain bracket.

Trial Examiner: In other words, as your profits rise, so do taxes?

The Witness: That is correct, but so that my original statement won't be misunderstood, it was my impression that if taxes actually are already having a pertinent bearing on the reduction of income, then it seems to me that there is a delicate point some place along the line as to how far rate adjustments can be made. In other words, I don't see how this, or any other Company, for a prolonged period, can face increasing tax rates and decreasing sale rates for its commodities, without there being some point arrived at where it is detrimental to the management in discharging its public duty. It seems to me that can be worked out mathematically.

Trial Examiner: Even though the taxes are passed on as operating expenses?

[fol. 1101] The Witness: Well, I say that from the credit position of the company, the taxes come out first, and unless an investor may—assuming we are going to have private financing of companies from time to time, whenever new capital is needed—that investors will feel that the credit position of the company is changing adversely if the combination of these two factors make it such that you cannot see an adequate return and safety of principal for the money you otherwise might be willing to invest.

Trial Examiner: The factor you now define is equally applicable to all regulated utilities, is it not?

The Witness: Yes, I think so.

Trial Examiner: In this economic period?

The Witness: I think so.

* * * * * * * *

By Mr. Wheat:

* * * * * * * *

Q. Let's turn to chart 16.

A. Chart 16, in Exhibit 65, captioned, "Historical costs of debt capital of Panhandle Eastern Pipe Line Company,

[fol. 1102] "1930-1941." This shows in per cent by years the cost of debt capital indicating that in the early years beginning in 1930, it was equivalent to 7.20 per cent, that in 1937, it was reduced to something approximating 4.6 per cent, where it remained for the years 1937, 1938, 1939 and 1940, and because of refinancing, about February of 1941, the cost was then reduced to 2.74 per cent.

Now, the right-hand bar marked "Weighted average," which shows 5.17 per cent for the entire period covered, is weighted on this basis:

That there are a certain number of years covered from 1930 to 1941, I believe eleven or twelve altogether, so that 1941 gets a weight of 12, 1940 a weight of 11, 1939 a weight of 10, and so forth, back to the earliest year, getting a weight of 1, so I have followed that practice here of trying to give the greatest weight to the current conditions, and it shows for 1941, 2.74 per cent, but on the weighted average basis, 5.17 per cent, and it does indicate to me that the company here has been following a policy of attempting to reduce its cost of capital at strategic points.

* * * * * * * *

Chart No. 17 in Exhibit No. 65, captioned, "Effect of 1941 refinancing of Panhandle Eastern Pipe Line Com-[fol. 1103] pany," shows first in the printed matter in the upper left hand part, the present funded debt. That is clearly shown. I don't believe I need read it unless you desire it.

* * * * * * * *

The schedule of debt retirement in the upper right hand box is in terms of millions of dollars, with a scale from zero to $2,000,000.

It shows the maturity yield based on the net price to the Company, and shows how that is effected in the period in question, from 1941 through to maturity date of the bonds, November 1, 1960.

The lower left-hand box captioned, "Schedule of Outstanding Debt" shows how the sinking fund and retirement procedure would work in terms of millions of dollars on a scale of zero to $30,000,000 from the present time,

to the maturity date of the bonds, showing they will be fully amortized at that time.

Q. What is the average annual interest cost?

A. The average annual interest cost of debt to-day is 2.74 per cent.

As shown on Chart No. 17:

Q. Chart No. 17,—that is right. The general effect [fol. 1104] of 1941 financing was to lower the interest rate on the long term debt?

A. That is correct, and brought it in line very definitely with current conditions, as I see them.

. . . . . .

Chart No. 18, Exhibit No. 65, captioned "Historical costs of preferred stock capital of Panhandle Eastern Pipe Line Company, 1937-1941," shows the cost of such capital as 6 per cent in 1937, 7.66 per cent in 1938, as reported by the Company in its annual reports, 6 per cent in 1939, as adjusted for that $1.50 which I have already discussed, as the dividend declared in January of 1940, would have made it 9.67 per cent, 1940 as actually reported, 9.67 per cent, making the adjustment back would have been 6 per cent, and the estimated 1941 figure of 8.45 per cent, and the weighted average on the same basis of weighting as mentioned in the costs of debt capital, 8.2 per cent.

Now, here again, these charts mentioned in Exhibit 65 are supported by the tables at the end of the exhibit.

. . . . . .

[fol. 1105] Chart No. 19, Exhibit 65, captioned "Earnings-Price Ratios of Natural Gas Pipe Line common stocks—1937-1940,"—this exhibit is divided into four groups of bars; one group covering each of the four years mentioned, for each of the companies included which are shown on the bottom, namely, El Paso Natural Gas Company, Interstate Natural Gas Company, Memphis Natural Gas Company, Southern Natural Gas Company, Panhandle Eastern Pipe Line Company and an average.

To get these figures as shown in the table for Chart No. 19, at the end of Exhibit 65, I took the earnings per share for each of the companies mentioned for each of the years

mentioned. I then found the average high and low prices for each of the companies' common stocks for each of the years mentioned, and then took the relationship of the earnings per share to the average of the high and low price, to determine an earnings price ratio for each of the companies for each of the years, and from those figures, calculated an average earnings price ratio, so that to make [fol. 1106] the example clear, El Paso Natural Gas Company, shown in the table, reported earnings per share of 3.73 in 1940.

The average of its high and low price in 1940 was 33.94.

The price, therefore, was 10.99 times the earnings for that year, and so on.

I followed the procedure in each of the years for each of the companies, thereby determining the following ratios, as shown in the chart itself.

Q. No. 19? A. No. 19.

In 1937, El Paso Natural Gas Company was 13.79 times.

Interstate Natural Gas Company was 9.90 times.

Memphis Natural Gas Company was 16.85 times, and, in the case of Southern Natural and Panhandle Eastern Pipe Line Companies, base figures were not available for prices in the years mentioned, and therefore, I could not make a calculation.

. . . . . .

Q. I would like to have you again explain what you did, to get the earnings-price ratio, and again I would like to have you develop for the record the difference, the essential difference for such a study as you have made, between an earnings-price ratio and a price earnings ratio, [fol. 1107] so that we may be clear in connection with the testimony you are now giving with respect to these individual companies.

. . . . . .

The Witness: Starting again with the figures in the table for Chart No. 19, the earnings for El Paso Natural Gas Company for 1940, were $3.73 per share. The average high and low prices for 1940 was $33.94 a share.

If the figure of $3.73 of earnings per share is divided by the price, the average price, of $33.94, instead of multiplying, we get 10.99 percent and that same correction would apply to anything else that I might have said, unless you want to have me restate the whole business.

Q. I don't care to have you do that. I just wanted to have the record perfectly clear, and on that matter, and I wish you would now, for the record, state the difference between an earnings-price ratio, which you have used and the price-earnings ratio, and why you have used the earnings-price ratio.

A. Well, in this particular case, I was taking the earnings per share and the average of the high and low price [fol. 1108] for the year in question, to determine what would have been, let us say, an earnings yield on the particular price of the stock, to get the total amount that was earned and which would be available, or a portion of it, for distribution.

Now, the other basis around would be to talk in terms of number of times earned a particular requirement was, but that would then relate to a dividend payment as against the total earnings that were available.

Q. Yes. Therefore, you have used the earnings price ratio in all instances, have you not?

A. Except where specified otherwise, and that is marked clearly.

Q. Yes. Thank you.

Now, will you go back to Chart No. 19, and explain that again?

A. In Chart No. 19, the figures for 1937 show that the earnings price ratio for El Paso Natural Gas Company were 13.79 for 1937, 14.08 for 1938, 10.6 for 1939 and 10.99 for 1940.

The figures for Interstate Natural Gas Company for 1937, 9.90, 1938, 10.02, 1939, 8.88, 1940, 8.67, and for the Memphis Natural Gas Company for 1937, 16.85; 1938, 16.24; 1939, 15.74 and 1940, 15.75.

In the case of the Southern Natural Gas Company and the Panhandle Eastern Pipe Line Company, data for 1937 [fol. 1109] and 1938 were not complete, so that the cal-

culations could not be made, but in 1939, Southern Natural Gas Company had 21.59 and for 1940, 20.13.

Q. All of these things you are reading are earnings in relation to price?

A. That is correct.

Q. And they are not times earnings? A. No.

The Panhandle Eastern Pipe Line Company for 1939 was 9.61, and for 1940, 13.55.

Then, taking all the figures for these companies, and striking an average, the average for 1937 was 13.51, the figures for 1938 were 13.45, the figures for 1939 were 13.28 and the average for 1940 was 13.82.

Now, I interpret these data to indicate that the figures shown in Chart 19 of Exhibit 65 indicate clearly what investors believe must be the fair figure for natural gas pipe line common stocks, or, to state it differently, they were actually the figures that were made during the four year period, 1937 to 1940.

Q. By the general experience of these securities in the Stock Market?

A. That is correct. That is correct.

Q. They show what investors actually have done, do they not?

[fol. 1110] A. That is correct.

Q. And those figures are not based upon any opinion of yours, but upon published data based on actual sales?

A. Arithmetical calculations from figures available.

* * * * * * * * * *

Chart No. 20 in Exhibit No. 65, captioned "Current Earnings-Price Ratios of Natural Gas Pipe Line Common Stocks," shows for Interstate Natural Gas Company, Memphis Natural Gas Company, El Paso Natural Gas Company, Southern Natural Gas Company and Panhandle Eastern Pipe Line Company, first, the earnings per share in the upper left-hand box, and that scale is in dollars per share from zero to $5.00; second the average market price, January 1, to August 31, 1941, shown in the upper right-hand box, which is in a scale of dollars per share from zero to $50; third, the earnings-price ratio, in the lower left hand box which is in terms of earnings-price ratio from zero to 25%, and fourth, the per cent of earnings avail-

able for common stock in terms of per cent, ranging from zero to 100.

The earnings per share for the 12 months ended Decem-
[fol. 1111] ber 31, 1940, of Interstate Natural Gas Company, was $2.07.

The earnings of the Memphis Natural Gas Company for the year ended December 31, 1940, was 69 cents.

The earnings for the twelve months ended June 30, 1941, of El Paso Natural Gas Company, were $3.61.

For the Southern Natural Gas Company, for the twelve months ended June 30, 1941, $2.04.

And for Panhandle Eastern Pipe Line Company for the twelve months ended June 30, 1941, $4.21.

Those are shown in the box in the upper left hand corner. The average market prices for the interim period January 1 to August 31, 1941, as shown in the upper right hand box, in terms of dollars per share, was $22.00 for Interstate Natural Gas Company; $4.57 for Memphis Natural Gas Company; $31.06 for El Paso Natural Gas Company, $11.81 for Southern Natural Gas Company and $36.50 for Panhandle Eastern Pipe Line Company.

The earnings price ratio, which are shown in the lower left hand box were 9.41% for Interstate Natural Gas Company; 15.10% for the Memphis Natural Gas Company, 11.62% for El Paso Natural Gas Company; 17.27% for Southern Natural Gas Company and 11.53% for the Panhandle Eastern Pipe Line Company.

Q. Now, Mr. Coffman, what do these earnings-price ratios signify in your estimation?

A. In my opinion, they signify that investors, the same [fol. 1112] as I have described it in Chart No. 19, were requiring in the interim period, January 1 to August 31, 1941, the relationship of earnings to price that is shown in the various bars 9.41, the lowest, in Interstate Natural Gas Company to the highest of 17.27 for Southern Natural Gas Company, and I presume the variations are largely explained by the difference in risk from one company to another.

That is what the investors were attempting to appraise.

Q. That is what investors would attempt to appraise in any refinancing?

A. That is correct.

Q. Now, what is the lower right-hand box?

A. The lower right-hand box shows the percent of earnings available for common stock, and indicates the difference that may be caused by different capital structures.

For example, in the Interstate Natural Gas Company, 100 per cent of the earnings are available for common stock, which would mean that the capitalization of that company is all common stock. There are no bonds or preferred stocks.

In the case of the Memphis Natural Gas Company, there is either some preferred stock or bonds ahead of the common, so that all the earnings are not available for the common.

The El Paso Natural Gas Company, there is available for [fol. 1413] common stock, 80.85%, and still less for Southern Natural Gas Company, until we come to Panhandle Eastern Pipe Line Company, which has already been described as having bonds outstanding, preferred stock and common stock, so that of the total amount of earnings available for distribution to capital, only 58.41 percent in the case of Panhandle Eastern Pipe Line Company, is available for common shares.

* * * * * * * *

I could add in regard to Chart No. 20 that one might note an omission of the Northern Natural Gas Company, but the reason that was omitted is because I set this up as a separate example because it is the most recent case of natural gas pipe line financing that I know about.

Q. And this bringing of Northern Natural Gas into focus in a separate chart, gives an impression, does it not, of what investors are now at the moment actually demanding?

A. It seems to me that it very definitely does, because the stock in this case is distributed, or, has been distributed early this year; it is only a few months back, and it is an actual test of what conditions are encountered by a corporation to secure private financing.

In Chart No. 21 of Exhibit No. 65, captioned "Cost [fol. 1114] of financing Northern Natural Gas Company, common stock—offered to public on September 10, 1941," it is broken into two divisions, or three boxes, as a matter of fact.

The one on the left-hand side shows prices, commissions and expenses per share.

The upper right-hand box shows earnings per share for twelve months ended June 30, 1941.

And the lower right-hand box shows earnings-price ratio.

In the left-hand box I show the price to the public, which is $31.40 as ex a 60 cent dividend.

The underwriting commissions were $2.35.

The expenses to the seller were $0.32.

Making the deductions of those items from the price to the public gives a net price received by the seller, ex the dividend, of $28.73 and would be the figure that would be logically included as the invested capital. The other will be the cost of financing.

The earnings per share, twelve months ended June 30, 1941, as shown in the upper right-hand side, shows the figures on two bases; first, $3.68 per share of earnings, on a regular reported basis, but if those earnings were adjusted to reflect the increase in taxes under the Revenue Act of 1941, then, those earnings would be $3.26 per share.

The earnings-price ratio below is shown on two bases, adjusted—shown as reported, and then shown for adjust- [fol. 1115] ment of 1941 tax rates, based on the price to the public before tax adjustments, 11.72 per cent, and after the tax adjustment, 10.38 per cent; and based on the net price to the seller before the tax adjustment, 12.81 per cent and after the tax adjustment, 11.35 per cent, so that here again it would seem to me that, as I interpret these data, that from an actual piece of financing in the market by a public utility, natural gas company, as recent as September of this year, it indicates that investors to be encouraged to make an investment in that type of security were requiring somewhere in the neighborhood of 12 per cent on

common stock to find it sufficiently attractive to encourage them, to make the dollar investment.

Q. Northern Natural Gas Company is quite comparable to Panhandle Eastern in respect to its operation, and is so generally recognized?

A. I think it is very comparable, yes.

Q. Does it, in your estimate, make a competent yardstick?

A. It seems to me the only yardstick, if you want to get to actual practices. If one wants to make the other comparisons that I have made of what the figures show for other companies, although they haven't been refinanced at the time, but their securities are being traded—but that is the next best, but I would rather work from tests such as this, than the other, than to take the other ratios alone.

[fol. 1116] Q. I take it that you believe that this is an actual yardstick which has been furnished you by very recent financing? A. Yes, I do.

* * * * * * *

Well, this chart No. 22 in Exhibit No. 65, captioned "Estimated current cost of financing common stock of Panhandle Eastern Pipe Line Company," summarizes to a large extent the preceding charts, and shows that the average of pipe line companies, based upon 1941 market prices, was 12.99 per cent, or in round figures, 13.00 per cent.

The Panhandle Eastern Pipe Line Company common stock showed 11.53 per cent.

The Northern Natural Gas Company, which I have just discussed, based upon actual public financing, and upon price to the seller, was 11.35 per cent, and for the purpose of calculations which I make hereafter, as I continue this study, I have taken the round figure of 12.00 per cent as representing what investors require, as a basis upon which they are willing to make new monetary commitments in this type of industry.

Q. And in respect to Panhandle Eastern Pipe Line Company?

[fol. 1117] A. That is correct, with particular reference to Panhandle Eastern.

Q. Now, that is an earnings return and not a yield return, is it not?

A. That is correct. You are exactly right. That is an earnings return.

It is not a yield.

Q. Not a yield at all? A. No, sir.

* * * * * * * *

Trial Examiner: You have nowhere in your exhibits made a comparison between cost of money by common stock financing to the other utilities, either water or electric?

The Witness: With particular reference to outside issues like natural gas?

Trial Examiner: For the purpose of comparison with [fol. 1118] present estimated costs of financing the common stock in the pipe line or natural gas company field.

The Witness: Well, in Volume 1 and 2, that is Exhibits 63 and 64, which we had this morning, the comparisons are shown there for individual companies, and the different utility classifications, but there would be no example therein of recent financing actually, such as was afforded by the Northern Natural Gas Company.

All I have there is then the actual test of the ratios judged by market prices at the time of bond, preferred and common stocks actually traded, but I had no examples of an actual piece of financing such as Northern Natural.

Trial Examiner: Have you shown earnings-price ratios in those tables to which you referred?

The Witness: The tables?

Mr. Wheat: You are referring now to what document?

The Witness: I am now referring to Exhibit No. 64.

In that particular exhibit, Appendix C I show the various divisions of the capital structure, but I take an all-round figure for the total. Now, you can't get the individual ratio specifically worked out because I was there considering the over all capital, but the data are there from

which calculations could be made, but I have not made them.

By Mr. Wheat:

Q. Well, in other words, may I ask a question here? [fol. 1119] In other words, Mr. Coffman, a consideration of data contained in Exhibit 64 will enable anyone to develop earnings-price ratios for each of the companies involved, will it not, for each of the periods involved?

A. That is right. I didn't go to that additional trouble in this study because looking for the over-all appraisals, I took the bonds, preferred and common stocks, and I, as I described this morning, lumped them together to get one figure.

Mr. Wheat: Yes.

It may be, Mr. Examiner, that we may some time during this proceeding, present these actual figures worked out on the basis of data shown in Exhibit 64. I don't know how long it will take, or whether it will be of pertinence, but we will be happy to consider that and see whether or not it is necessary.

Trial Examiner: The method of presentation of the data in these exhibits as selected in the first place, three fields for comparison, it does not require proof that we are in a strained period from an economic standpoint.

The Trial Examiner has no idea of just how these conclusions presented by Mr. Coffman should be considered with relation to the whole field of financing. It is, of course, a well-known fact that stock financing at this period is difficult in any field, even the best.

It is a bond market, is it not?

[fol. 1120] The Witness: The bond market has been the strongest of any of the markets; that is right.

Trial Examiner: Also, it would seem that a comparison with the recent experience of the companies attempting to finance by common stock in other utility fields, at least, should be presented; and my inquiry was, simply [ask] whether you presented it, and whether I might look in your exhibit for it.

The Witness: You can't. The basic material, most of it, is available, but the figure you look for is not specifically there.

. . . . . .

I just wanted to make the observation that in Chart [fol. 1121] No. 19 is discussed this particular thing, although it is related to natural gas companies. Of course, covering four years would, to me, avoid the pitfall that one might encounter if any one year were difficult, but a four-year period, although it may not be long enough, nevertheless, would indicate that the conditions existing are somewhat of a longer term, consequently, than a momentary difficulty, that is, when we speak of the common stock, for instance, the stock market being weak and the bond market strong, it has now gone on for a period of years, during which period of time such a condition has existed, and that might be different if it was just a year or a few months.

Trial Examiner: Wouldn't it also be helpful to know the earlier experiences in the field of financing for natural gas pipe line companies through the sale of common stock? In other words, your industry is new. What relative change has there been in the cost of financing, taking into account economic conditions from the very beginning to date?

The Witness: We could easily make such a calculation, but because of trying to keep the study to a more current condition, I haven't done it, and I didn't intend to do that. We can do it. We have all the facts and figures in our files available for making such a study.

Trial Examiner: To me it was quite surprising you had obtained the present bond interest rate of less than 3 per [fol. 1122] cent in a field which I think some years ago many people considered to have been a speculative risk, and I wondered if there was a comparable, or similar change in the cost of money through common stock financing.

The Witness: Well, those figures could be very easily developed, but I can't give you the figures here because I haven't them in my study.

. . . . . .

Trial Examiner: You will consider, Mr. Wheat, it is a notable fact a natural gas pipe line company has borrowed money at less than 3 per cent.

Mr. Wheat: I think it is an astonishing reflection of the efficiency of the management of the Company.

Mr. Culton: I might; in this connection, suggest that it would be difficult to get many companies of that character, because very few have been financed by common stock issues sold to the public.

Trial Examiner: I assume that is true.

Mr. Culton: That is the difficulty.

Trial Examiner: For the most part, it has been an owner-investment.

The Witness: That is right.

. . . . . .

[fol. 1123] By Mr. Wheat:

. . . . . .

Q. Would you now turn to Chart 23, and state what is shown on that chart?

A. Chart No. 23 in Exhibit No. 65, captioned "Continuing growth of Panhandle System, indicates future needs for new capital," and this chart is divided into four sections.

The upper left-hand section shows the pipe-line miles, gathering, main and lateral lines, as of December 31, of each of the years 1936 to 1940, both inclusive.

This scale runs from zero to 4, in terms of thousands of miles.

It shows that in 1937, there was 1,651 miles.

[fol. 1124] The Witness: (Continuing) In 1940 this had increased to 2,374 miles.

In the upper right-hand section, captioned "Installed Horsepower of Compressor Stations as of December 31", for each of the years 1936 through 1940, all inclusive, the scale is in terms of thousand horsepower and ranges from zero to 100, indicating that the installed horsepower of

compressor stations increased from 43,300 horsepower to 80,100 horsepower between 1936 and 1940.

In the lower left-hand division is shown gross property as of December 31 for each of the years 1936 through 1940 in terms of millions of dollars on a scale from zero to 80, showing that the gross property was equivalent to $46,600,000 as of the end of 1936 and increased through the years to $64,900,000 at the end of 1940.

In the lower right-hand box is shown the annual increase in gross property for the years 1936 through 1940 in terms of millions of dollars, with a scale ranging from zero to 16, showing that in 1936 there were $4,300,000 annual increase in gross property; in 1937, $11,400,000; lesser amounts in 1938 and '39 and $5,400,000 in 1940.

* * * * * * * *

Or an average of four and a half million dollars for the '36-'40, both inclusive, period, so that interpreting that [fol. 1125] figure in line with materials shown in earlier exhibits it shows a striking growth in this company and conditions at the present time indicating that that growth may be continued for some time to come. It seemed to me reasonable to say that an average expectancy per annum of four and a half million dollars for additional increases in gross property was not unreasonable, so long as that growth continued.

Q. Well, in order to increase gross property a company such as this must have new capital, must it not?

A. Some place along the line it would certainly have to have new capital.

* * * * * * * *

Chart No. 24 of Exhibit 65, captioned "Panhandle Eastern Pipe Line Company Invested Capital as of June 30, 1941," shows the various detailed items in the capital structure, including the various items of the long-term debt, the preferred stocks and the common stock and surplus.

It shows there the principal amounts or shares of each, the book value of each and the percentage to total cap- [fol. 1126] italization, the net debt is equivalent to 34.46

percent of the total invested capital on a total capitalization basis, the preferred stock represents 17.91 percent and the common stock and surplus represents 47.63 percent, which percentages are equal to 100, or in terms of dollars amounts to $61,423,853.

Those figures that I have read are taken from the first three columns presented in this particular chart.

In the second three columns of figures, I show what the market appraisal of this capitalization is. Using market prices for each of the securities outstanding, where such market prices were available, or using, as clearly marked in the footnote, "Prices Estimated. Sold privately in January, 1941, at 100 to several banking institutions and one insurance company," and so on, I have explained which price I have used throughout the individual figures.

I show that the market appraises the debt part of the capital structure at $23,500,344 or the equivalent of 36.59 percent. It appraises the preferred stock at $11,250,000 or 17.52 percent and the common stock and surplus at $29,468,896 or 45.89 percent. The 100 percent total is equivalent in dollars, market appraisal, to $64,219,240.

Now that to me indicates a very close approximation between the market appraisal, on the one hand, or $64,219,-
[fol. 1427] 240, and the book value of $61,423,853.

From studies that I have made of numerous other companies, it is seldom that one finds the appraisal made by the market of the total capitalization of a company approximating the book value and in this particular case it would indicate to me that the investors believe that the book value here must be an accurate figure.

. . . . . .

No. 25 in Exhibit 65, captioned "Preferred Stock Unusual in Natural Gas Pipe Line Companies, Based on Book Figures as of December 31, 1940," is shown in terms of percent of invested capital with a scale from zero to 22 and covers Cities Service Gas Company, El Paso Natural Gas Company, Interstate Natural Gas Company, Memphis Natural Gas Company, Mississippi River Fuel

Corporation, Northern Natural Gas Company, Southern Natural Gas Company and Panhandle Eastern Pipe Line Company.

Q. In only two did you find preferred stock outstanding, is that not true?

A. Yes. In all the companies that I have just men- [fol. 1128] tioned there were only two that had preferred stock outstanding and the one is negligible, in the case of El Paso Natural Gas Company, and the only other is Panhandle Eastern which has 18.52 percent.

Q. Well now, let me ask you, Mr. Coffman, in your estimation what is the significance to be attached to this particular chart?

A. Well, as I interpret the data contained in this chart, it indicates that preferred stock has not been considered a sound part of a capital structure in this particular industry, that preferred stock is generally not looked upon with too much favor, therefore, these companies have not any preferred stock outstanding except the two mentioned.

I further conclude, in view of these facts, that it might be wise if at some point along the line with the management of Panhandle Eastern, following its policy to make adjustments of its capital structure to the times, that it eliminate the preferred stock or otherwise refinance it.

* * * * * * * * *

Mr. Williams: Is your information such as to permit you to state whether or not these companies such as Cities Service Gas Company, Interstate Natural Gas, and so forth, are wholly owned subsidiaries?

[fol. 1129] The Witness: Are what?

Mr. Williams: Wholly owned subsidiaries. Is their stock held by some holding company?

The Witness: In many of these companies?

Mr. Williams: Yes.

The Witness: Not in all cases.

Mr. Williams: Will you state which ones are not?

* * * * * * * * *

The Witness: I would prefer to check that before I answer.

. . . . . .

Trial Examiner: Your Exhibit 64 contains an appendix [fol. 1130] shewing a number of ownerships.

The Witness: That is right.

Trial Examiner: Including gas companies beginning at Statement F, 20 pages or less, which I believe answers the question which Mr. Williams has asked.

The Witness: That is right, but I can't answer it directly without referring to records.

By Mr. Wheat:

Q. We will look up Cities Service Gas Company.

A. Cities Service is one that is held by a holding company.

Q. How about Interstate Natural?

A. Interstate Natural Gas Company, as shown in Appendix B, page 3, Exhibit 64, had outstanding as of December 31, 1940 $6,529,530 of common stock of which $1,893,564 was held by the public and $4,635,966 was held by affiliates. The stock therefore was not a wholly-owned subsidiary of a holding company.

Q. Well, what about the other pipe line companies shown on the Chart No. 25?

A. Of the other pipe line companies, namely El Paso Natural Gas Company, Memphis Natural Gas Company, Mississippi River Fuel Corporation, Northern Natural Gas Company, Southern Natural Gas Company and Panhandle Eastern Pipe Line Company, in only one case was all of the common stock held by a holding company. That case was the Mississippi River Fuel Corporation. Complete data referring to the ownership and the securities of these companies are shown in Appendix B of Exhibit 64. I might say, however, in order to clarify this part of the testimony that, as the chart shows, none of the natural gas pipe line companies with the exception of El Paso Natural Gas Company and Panhandle Eastern Pipe Line Company had any preferred stock in their capitalizations whether held by the public or by affiliates.

. . . . . .

Chart No. 26 of Exhibit 65 captioned "Earnings Necessary to Maintain Credit Position of Panhandle Eastern Pipe Line Company" shows on the bar the invested capital based upon the capitalization as of June 30, 1941 which totals $63,525,839, which total is made up of bonds in the [fol. 1131] amount of $23,267,544; preferred stock, $11,000,000; and common stock, $29,258,295.

I then have presented in this exhibit the earnings required to maintain the quality.

Q. You mean the quality of this particular credit position?

A. To maintain the various classes of the capital structure. In other words, in the preceding exhibits I have already shown that the bond class of the total capitalization carried a rate of 2.74 percent, so that with bonds outstanding in the amount of $23,267,544 with a rate or cost of 2.74 percent would require a certain amount of earnings to maintain that rate.

The preferred stock of $11,000,000, which I have shown had a historical cost weighted such as to give the current conditions greatest weight at 8.45 percent.

That would require certain additional earnings and the common stock figure at 12 percent, which has already been discussed, gives a total of earnings that would be necessary to maintain these various groups of the capitalization of $5,077,648.

Now, those various figures, I can refer to the specific exhibits. The 2.74 percent was shown in Chart No. 16 of Exhibit 65, and the 8.45 percent was shown in Chart No. 18 [fol. 1132] of Exhibit 65, and the 12 percent was shown in Chart No. 22 of Exhibit 65 and the result of this analysis indicates that if the investors require these various percents of earnings to attract capital in the division that may be considered, that is where it be a bond, a preferred stock or common stock, then this total capitalization of $63,525,839 in the proportions here stated would mean that the management of the company would have to have earnings of $5,077,648 to maintain the quality of those particular securities.

. . . . . .

In Chart No. 27 of Exhibit 65, captioned "Earnings Necessary to Maintain Credit Position of Panhandle Eastern Pipe Line Company," the total invested capital is shown at $63,775,839.

Now, the reason for that is that, as explained in the chart, I have assumed here the refinancing of the preferred stock by means of 50 percent bonds sold on a basis of three and a quarter percent and 50 percent of common stock sold on a basis of 12 percent, therefore, we would have a resulting capital structure in which there would be only bonds and common stock.

On that basis the 2.74 percent would increase slightly because of 50 percent bonds at a three and a quarter rate [fol. 1133] so that the bonds would then call for a 2.84 percent earnings base and the common stock continued at 12 percent would indicate that the management would have to have $5,006,338 to maintain the present quality of these securities.

Q. When you say "proposed" on Chart No. 27, you mean, do you not, that this is an assumption on your part in order to obtain these data?

A. Yes, it really should be, probably "projected." It is my analysis. From the preceding Chart No. 25 I concluded that perhaps the preferred stock was not a logical part of a company in this particular industry and I have made an assumption here to see what could be done by way of putting it all in bonds and common stock.

Q. It is your conclusion that the management would have to have slightly over $5,000,000 in order to maintain the quality of such securities as you have assumed on Chart No. 27?

A. That is exactly correct, yes, sir.

Q. Now will you turn to Chart 28 and state what is shown on that chart?

A. Chart No. 28 in Exhibit 65 is captioned "Over-all Cost of Capital to Panhandle Eastern Based on Ideal Capital Structure, Capital Structure Composed of 40 Percent Bonds and 60 percent common stock."

Here I have assumed a debt equivalent to 40 percent of [fol. 1134] the total capitalization on a 3 percent basis. There being no preferred stock and the common stock rep-

resenting 60 percent of the total capitalization on a 12 percent basis would then give for the total capitalization 8.40 percent rate that the investors would require to maintain the present quality of the capital distributed, 40 percent to bonds, 60 percent to common.

Q. That is 8.40 percent of what?

A. That is the earnings which would be required to cover the particular securities satisfactorily enough to maintain the credit position in the minds of the investors.

Q. Yes. Now what are the figures that bring about the 8.4 percent.

A. Well, it is merely 40 percent at 3 percent basis and 60 percent at 12, which is 74 plus the 12 making 84.

Q. Yes, and you have previously testified how you reached those other percentages, have you not?

A. That is correct, they are already supported by our charts.

Q. And there is no supporting table for this chart, of course, because it is self explanatory?

A. That is correct, yes, sir.

. . . . . .

Chart No. 29 of Exhibit 65 is captioned "Dollars Needed [fol. 1135] Annually by Panhandle for Operations and Maintenance." It is the beginning of the part of this study wherein I am trying to consider the various component parts of the costs of operations plus the money income that would be needed to give a gross revenue figure that the management would have to have to maintain the efficiency of its present service, allow for return of the capital which is presently invested in the firm, maintain the credit position of the corporation so new financing could be done and otherwise enable it to discharge its duties to the public.

Q. Yes.

A. On the basis of the annual report, the actual 12 months ended June 30, 1941, operations and maintenance charges totaled $3,196,797. Of that amount, operations accounted for $2,902,353 and maintenance accounted for $294,444.

The right hand column is entitled "Projected." I have merely added to the actual for the 12 months ended June

30, 1941 what I believe to be a reasonable allowance for higher operating costs in a reasonable future period.

Q. Is it not a fact, Mr. Coffman, that you have attempted to be highly conservative in using only a 10 percent increase in this item?

A. Well, I believe that that is true for a reasonable period because as we know, various costs, material, wages [fol. 1136] and other items are going up and we are informed by various Government officials that the trend is likely to continue in that direction for some time.

I believe it very definitely is true, yes, and I allowed 10 percent as being a conservative figure to alter the actual for 12 months which will not be the same amount even though the volume would continue the same for another year on the score that these costs will be increasing.

Q. And, Mr. Coffman, should it prove to be the event that costs go up more than 10 percent then your right-hand or projected column would be greater than is there shown on Chart 29, is that not true?

A. That is true.

Q. That would be true of all other charts which follow this and deal with similar subjects?

A. That is correct, yes, sir.

Trial Examiner: Have you stated here what you include in operations?

The Witness: Well, in operations, that includes the wage cost, the material cost, all the miscellaneous charges that go in to make up operations, repairs, and so forth.

Trial Examiner: But not including depreciation and taxes?

The Witness: No, those are included later; those are [fol. 1137] shown separately.

This projected figure then totals, with the allowance of an increase of 10 percent for rising costs, $3,516,000, which allows operations $3,192,000 and maintenance $324,000.

* * * * * * * *

Chart No. 30 in Exhibit 65, captioned "Dollars Needed Annually by Panhandle for Taxes", shows in the left-

hand bar the actual figures for the 12 months ended June 30, 1941 which total $3,008,117, of which $2,359,100 was for Federal income and excess profits taxes and $649,017 was for state, local and miscellaneous Federal taxes.

For reasons that have already been given in the study by differences in the second Act of 1940 and the 1941 Revenue Act, I have here made allowances for a further 10 percent increase in Federal taxes and on that basis get a total for the company of $4,399,000, which is distributed $700,000 to state, local and miscellaneous Federal, $3,363,000 for Federal income and excess profits, and taking the additional amount of $336,000 as being the amount of further increase over the higher rates in Revenue Act of 1941, making a total of $4,399,000.

Q. Now, if is a fact, is it not, Mr. Coffman, that the [fol. 1138] state, local and miscellaneous Federal taxes are increasing in a much smaller ratio than are the Federal income and excess profits taxes?

A. Yes, sir, they have been up to date.

* * * * * * * * *

Q. Now is there anything further you wish to state about Chart No. 30?

A. Well, the only point again is the one I have mentioned in the study heretofore, namely, that the increased taxation does have a definite effect upon the net income available for distribution to the capital and at the same time, naturally, if there are changes in rates to the company that would influence the gross revenue.

And if the taxes are working on one end and the rate reductions are working on the other there is some point arriving where investors would not be interested any longer in this firm because it has so changed these ratios I have discussed that they would not feel warranted in putting up additional capital to finance any new requirements.

[fol. 1139] Q. Which new requirements you believe to be necessary as indicated by the history of the company?

A. Based upon the past experience for a number of years and the continued growth which can be seen with reason at this time, it would average at least four and half

million dollars a year, so that some place along the line some new capital will be required.

Q. Now, will you turn to Chart 31 and state what is shown on that chart?

A. Chart No. 31 in Exhibit 65, captioned "Dollars Needed Annually by Panhandle to Return Capital to Investors When Gas Reserves are Exhausted," deals with the item that has just been asked, namely, the provision for depreciation, depletion and amortization. The actual 12 months' figure ended June 30, 1941 totaled $2,316,560.

I have increased that to $2,551,034, which was made on the basis of an annual provision necessary to retire $63,775,839 of invested capital, which is a figure already shown in the preceding exhibit, over a 25-year period which is the estimated life of the gas reserves I have used.

Q. You took this from the statement of Mr. Ralph E. Davis, quoted in a registration statement of the company, have you not?

A. That is correct, yes.

Q. You have made no examination of that?

[fol. 1140] A. No.

Q. You accepted that figure and used 25 years on that basis?

A. Throughout this study I took figures from recognized sources or the annual report and I have made no study of my own.

Q. On that basis you arrived at the figure of $2,551,034?

A. That is right.

Q. Should it appear from a greater study that a greater amount would be needed for such provision, then that right-hand column would be raised accordingly. Is that not true?

A. That is true.

Chart No. 32 of Exhibit 65, captioned "Dollars Needed Annually by Panhandle for Current Capital Requirements, Bonds," actual figures for 12 months ended June 30, 1941 totaled $1,030,003. Of that total, interest on funded debt less other interest deductions, net, amounted to $723,468 and $306,535 was for amortization of debt discount and expense.

The right hand column marked "Projected" shows a reduction to $807,516 because of certain changes which produced savings through the refinancing in January of [fol. 1141] 1941, so that on the new basis the interest on the debt outstanding after January 1941, refinancing at that period would be $540,625. Interest on the $5,625,000 of new debt at 3.25 percent; if the preferred stock is eliminated as suggested in Exhibit 65, Chart 27, would amount to $182,812 and $84,079 would be attributed as amount necessary to amortize $2,101,986 of debt discount and expense over 25 years, the estimated life of the gas reserves as taken from the source already mentioned.

* * * * * * * * * * *

Chart No. 33, in Exhibit 65, captioned "Dollars Needed Annually By Panhandle For Current Capital Requirement—Preferred Stock" presents similar information for preferred stock as was presented in Chart No. 32 for bonds.

The actual amount for the 12 months ended June 30, 1941 totaled $1,388,480. Of that amount there was $660,000 required at the regular fixed dividend rate. The preferred stock Class A happens to be participating and the maximum participation of this Class A accounted for $728,480.

[fol. 1142] Because of the assumption I made that the preferred stock would be retired by raising new capital in the amount of 50 percent by bonds on a 3.25 percent yield basis and 50 percent sale of additional common stock on a 12 percent earnings basis, there would be no future requirement for preferred stock.

* * * * * * * * * * *

Chart No. 34, Exhibit 65, captioned "Dollars Needed Annually by Panhandle For Current Capital Requirements—Common Stock" shows the actual figure for the 12 months ended June 30, 1940 at $3,396,492. This figure would become $4,185,995 with the change in capital structure already noted. Of that total, $3,510,995 would represent 12 percent earnings-price ratio on $29,258,295 of common stock and surplus as of June 30, 1941 and $675,000 would represent a 12 percent earnings-price ratio on the

$5,625,000 of additional common stock to be sold to provide 50 percent of the capital necessary to retire the preferred.

Chart No. 35 in Exhibit 65, captioned "Dollars Needed Annually by Panhandle for Total Current Capital Requirements—Total Invested Capital," shows the actual figure for the 12 months ended June 30, 1941, total $5,814,975; [fol. 1143] of which bonds account for $1,030,003; preferred stock, $1,388,480; and common stock, $3,396,492.

Those figures have already been presented in the preceding charts.

The projected figure, therefore, assuming the present preferred is retired, would be a total of $4,993,511 of which bonds would take $807,516 and common stock would take $4,185,995.

Chart No. 36 in Exhibit 65, captioned "Dollars Needed Annually by Panhandle to Provide Service to Customers, a Fair Return to Investors and Restore Invested Capital When Gas Reserves Are Exhausted," summarizes all this information and is based upon a refinancing of the preferred stock.

On the basis of these figures it indicates that the management would have to have for the purposes mentioned $15,459,545 of which $3,516,000 would be necessary for operations and maintenance, $4,399,000 would be required [fol. 1144] for taxes, $2,551,034 would be necessary to return the capital when the gas reserves are exhausted and $4,993,511 would be necessary to mainfain the capital requirements so that new capital could be secured when required.

Mr. Littman: May I inquire what gas reserves you are speaking of that are going to be exhausted? Will you tell us a little bit about that so that I will know what you mean?

The Witness: Well, the company is securing gas from gas wells and those gas wells are down in Amarillo and

Hugoton Sections, that are estimated at various lengths of life according to estimates made by various engineers and they have placed various life values upon those reserves and as reported in the S.E.C. statement it seemed that the average life of those reserves was in a 25-year period, so I took the 25 years as being a sound figure based upon such engineering estimates.

Mr. Wheat: Let me ask a question which may clear this up. May I, Mr. Littman?

Mr. Littman: Yes.

By Mr. Wheat:

Q. If it should appear that the prospective exhaustion of those gas reserves or any major part thereof would be within 25 years, then the amount which you have shown for the return on capital when gas reserves are exhausted [fol. 1145] would be increased, would it not?

A. That is correct.

Q. And vice versa, should it appear as a result of these hearings that the life of the reserves now owned by the company would probably be longer than 25 years, then that figure would be reduced, isn't that true?

A. That is correct.

Q. And that figure is based upon the assumption of 25 years made by you?

A. That is correct.

* * * * * * * * *

Trial Examiner: The total of $15,459,545 is to be compared with an estimated earnings from total operating revenue. Now $15,409,387 is for the current year; is it not, Mr. Wheat, shown in Exhibit 49?

Mr. Wheat: Well, I think that the figures have a comparative value, let us put it that way, which I think will appear in the general discussion which must result in this case.

Trial Examiner: Exhibit 49, Schedules 1 and 2, I think.

Mr. Wheat: Yes, I think there are figures there which ought to be compared rather closely with these figures of the witness. However, I would like to ask the witness to turn to Chart No. 37, which shows the present situation

[fol. 1146] based on the present capital structure and state what is needed in his estimates and on the basis of these studies; based on the present capital structure.

The Witness: Chart No. 37, Exhibit 65, captioned "Dollars Needed Annually by Panhandle to Provide Service to Customers, a Fair Return to Investors and Restore Invested Capital When Gas Reserves Are Exhausted, Based on the Present Capital Structure," would then show total dollars needed of $15,520,855, of which operations and maintenance would require $3,516,000; taxes, $4,399,800, return of capital when gas reserves are exhausted of $2,541,034, and to maintain the present capital requirements, $5,064,821.

By Mr. Wheat:

Q. As has been shown on previous charts?

A. Yes, sir.

Q. Yes.

I think, Mr. Examiner, that possibly that figure would be more comparable than the one that you mentioned, but I assume that is a matter of argument which will come later and have clarification on the record by counsel, yes.

Trial Examiner: Yes, this, of course, you are unable to compare because it contemplates no new financing and takes the company as is.

. . . . . .

[fol. 1147] Mr. Littman: I take it from your responses to Mr. Wheat's questions you are not vouching for any precise period as to when these gas reserves are going to be exhausted, are you?

The Witness: Well, all I am saying is that I have seen in the S. E. C. registration statements comments in regard to gas reserves and their length of life which was in terms of 25 years. I am not an engineer so I didn't make an engineering study, myself, neither did I have any engineering report given to me. I got the figure from a recognizable source.

Mr. Littman: From the registration statement filed by Panhandle Eastern Pipe Line Company.

The Witness: With the S. E. C., yes.

Mr. Littman: In other words, you assumed the period that you found in that statement as the basis for this chart?

The Witness: That is right, it was 25 years.

Mr. Littman: In other words, if it had been 100 years you would have shown the result on the basis of 100 years.

The Witness: If the S. E. C. statement had shown it, I would, yes.

By Mr. Wheat:

Q. Mr. Coffman, are the totals on the columns at the [fol. 1148] left-hand sides of Charts Nos. 36 and 37, which are, respectively, $15,459,545 and $15,520,855, in your opinion and based upon your studies, the irreducible minimum dollars which would be required by this company on the two bases, one of refinancing preferred stock and the other of the present capital structure as shown on those charts?

A. Yes, sir, they are.

. . . . . .

Mr. Littman: Based on the information that you received from various sources that you mentioned, that is, your answer to Mr. Wheat's question, I take it, is predicated on that information—

Mr. Wheat: (Interposing) I will stipulate to that, of course.

. . . . . .

[fol. 1150] P. McDonald Biddison, having been previously sworn, resumed the stand and testified further as follows:

. . . . . .

By Mr. Wheat:

Q. Mr. Biddison, will you please turn to page 9 of Exhibit 62 for identification and continue your statement with respect to the other production system structures?

A. The items shown at line 8 on page 9 of Exhibit No. 62 have been carried forward in the general summary of production system property on page 3 at line 6.

Q. Well, also on line 5 of page 2, have they not?

A. Yes, I have finished the description of the group of property classified as production system property and beginning on page 12 and continuing to page 44 I have set out my estimates of the amounts to be deducted for depreciation on transmission system property, page 12 being a summary of transmission system property.

Beginning on page 13 I have shown the amounts to be deducted for depreciation on transmission measuring and [fol. 1151] regulating station structures, these being the structures that house the measuring and regulating equipment.

Q. Well, for example, let's look at those production stations which I see you have listed under Texas, Kansas, Kansas local area and Missouri local area. What are those?

A. Those are the structures that house the measuring equipment to measure gas produced from wells owned by Panhandle Eastern Pipe Line Company.

Q. How did you arrive at the figures you have shown in Column C on page 13 for these items?

A. In my inspection of the properties of Panhandle Eastern Pipe Line Company, I inspected stations both in the Texas Panhandle field and in the Hugoton field and made notes of the condition of the structures which I saw.

I have noted the amounts which I think should be deducted from cost of reproduction new for the amounts of loss in value that has occurred in those stations and have deducted in Column C the amount by which I think those stations have depreciated to arrive at the present value figures in Column D.

Now, the same procedure was adopted in connection with the other groups of measuring station structures, namely, purchase stations which embrace the structures housing equipment, measuring gas purchased; for the wholesale sales stations beginning at line 12, page 13; for the industrial sales stations, beginning at line 20; for the field [fol. 1152] sales stations, beginning at line 23; for the main line check stations, beginning at line 25; and for the main line regulating stations beginning at line 29.

I have thereby arrived at a total deduction for depreciation for structures in this group of $11,137.11 which, deducted from the total reproduction cost new for the group in Column B of $104,475.27, produces a present value total in Column D of $93,338.16.

These figures have, in turn, been transferred from page 13 to line 4 on page 12.

. . . . . .

Q. Now, will you turn then to page 14, which is headed "Other Transmission System Structures" and state what [fol. 1153] is included in that particular item?

A. In that item is included the residences and garages and site improvements at the compressor stations, the warehouses at Belton and Booneville, Missouri; at Centralia and Houstonia compressor stations and the residences at the Dana measuring station near the Indiana-Illinois state line.

For each of the structures listed in Exhibit No. 39 I have determined from my observations the amount by which these structures have depreciated or lost value and for each of those structures I have made a deduction in my working papers of those amounts and on page 14 have summarized those deductions.

. . . . . .

The details of the individual structures are shown on pages 15 to 18, inclusive. Referring to page 15 it may be noted that for the structures at Hansford Camp, lines 2 to 16, inclusive, there is no deduction made for depreciation on structures.

Those structures were erected late in 1940. No ascertainable depreciation would likely be found upon a careful investigation of structures of so young an age.

I wish to call attention to the fact that my visit to Hansford station was at night and I was not able to make an investigation of the individual structures and have de- [fol. 1154] termined the zero amount for deduction for depreciation on the basis of the fact that they are new.

In the next item, Sneed Camp compressor station, embracing the items from line 17 to line 32, we will take for

example a warehouse at line 18. My observations indicated that this warehouse had lost about 5 percent in value and I have, therefore, deducted from the estimate of reproduction cost new 5 percent or $216 to arrive at the present value figure of $4,104 shown in Column D. Similarly with the other items for the structures at Sneed Camp and warehouse.

Now, I have followed a similar procedure for the balance of the items down to and including page 18 to arrive at a total deduction for depreciation on other transmission system structures of $38,572.16 to produce the present value figure in Column D of $344,348.43.

Q. Which is carried forward then to recapitulation on page 14, is it not? A. That is correct.

Q. And then to recapitulation on page 2? A. That is correct.

. . . . . .

[fol. 1166] P. McDonald Biddison, having been previously sworn, resumed the stand and testified further as follows:

. . . . . .

[fol. 1168] By Mr. Wheat:

Q. Will you take up your discussion of the data con-
[fol. 1169] tained in Exhibit 62 and your studies connected therewith at the point that you left off at our adjournment of yesterday?

. . . . . .

A. The next item is transmission measuring and regulating station equipment shown on page 19.

. . . . . .

That consists of the equipment used to measure and to regulate the pressure of the gas purchased and of the gas sold or otherwise delivered.

In Column C, I have shown for various classes of measuring and regulating stations the estimate of the amount to

be deducted for their loss in value and in Column D I have shown the result of subtracting Column C from Column B.

I have obtained on page 19 a total deduction for depreciation of $39,350.84 and a present value of $452,334.48, which I have carried forward to the summary of transmission system property, page 12, at line 8.

Q. And also your general summary on page 2, line 13, is that not true? A. That is correct.

Q. Now, Mr. Biddison, will you turn to page 19 of Exhibit 62 and, taking an example of this transmission measuring and regulation station equipment, state how you arrived at the deduction which you have stated should be made for de- [fol. 1170] preciation?

A. As an example, we will take well measuring stations, Texas, line 2 on page 19. I made specific notes, during my inspection, on the equipment at 12 such stations. The equipment is uniformly in excellent condition, of first class appearance and the allowance for deduction for depreciation is simply that one indicated by judgment to allow for defects and for deterioration, which, under all probabilities, will exist to some degree.

I, therefore, deducted approximately 5 percent from the cost of reproduction new for this equipment to obtain the present value in Column D.

Q. Well how did you fix on 5 percent as an approximation?

A. Just as I have explained, as a judgment figure that I thought would be ample to cover the matter. There is no depreciation on it that can be seen more than the deterioration in the paint.

Q. What do these stations consist of, Mr. Biddison? What are they?

A. They consist of pipe, pipe fittings, either cast or welded fittings, valves, regulators, pressure gauges and gas meters. These latter may be either of the displacement type or of the orifice type.

The orifice type is almost universally used on stations [fol. 1171] for the purchase of gas in the field and it is

used on sales stations where the ratio of the peak rate of flow to the average rate of flow is not too great.

Q. Now, in all instances in connection with the study outlined on Exhibit 2, Mr. Biddison, is it a fair statement to say that the items which you have headed "Deduct for Depreciation" or "Deductions for Depreciation" represent your judgment of the amount of depreciation that has accrued to the date of your study in the particular items of property that you mentioned? A. That is correct.

* * * * * * * *

Q. That represents your judgment as to the depreciation which now exists in the property?

A. That is correct.

Now, in a great many of these cases, the amounts shown are the result of a computation from judgment figures, so that the final figure is not always just a judgment figure; it is the result of the application of factors arrived at by applying my judgment to what I saw.

* * * * * * * *

[fol. 1172] Q. Well then, will you turn to the item of transmission mains which I believe is the next main item. Is that true?

A. That is correct, beginning on page 20.

Q. And that continues, does it not, for several pages of your Exhibit 62?

A. Yes, specifically to include page 29.

Q. Twenty to twenty-nine, inclusive? A. Yes, sir.

Q. All right, will you state what you did in arriving at the sums which you believe should be deducted for depreciation with respect to transmission mains and state the main figures which you have arrived at?

A. The first group of transmission mains, well lines, is detailed on page 21.

Q. What are those well lines, by the way?

A. These are the lines which connect the gas wells from which Panhandle Eastern takes gas in the gas fields into a subsequent group of lines called gathering lines. The well lines are the initial lines through which gas flows from the well into Panhandle Eastern's pipeline system.

Q. What did you find with respect to those lines?
[fol. 1173] A. With respect to well lines, I have found upon numerous examinations that the condition of well lines in any given field was generally about the same as that of the larger lines in that same field, therefore, a determination of the condition of larger lines in any gas field is a good criterion to apply to the condition of the smaller diameter and shorter length well lines.

In determining the amounts of money to be deducted for depreciation from such lines I have, therefore, given effect to the information derived on the gathering lines.

Q. Would you prefer to discuss this after you have discussed the gathering lines?

A. No, I think I can complete it right here as we go through and, as may be noted, on page 21, the amounts deducted for depreciation from well lines is substantially 10 per cent of their reproduction cost new.

I have arrived on page 21 at a total deduction for well lines of $14,419.06 producing in Column D a present value figure of $129,690.52.

Q. Which is carried forward, is it not, to page 20, line 4? A. That is correct.

Q. And that represents your statement, does it, of the deduction for depreciation which should be made with respect to these well lines?
[fol. 1174] A. That is correct.

. . . . . .

The gathering lines are those lines connected to the outlet side of well lines which in a particular field collect and gather the gas for delivery to a central point. These lines are shown upon page 22.

Q. Exhibit 62?

A. Yes, sir. The statement of reproduction cost new on page 22 is not identical with the statement of reproduction cost new of those items in Exhibit No. 39.

Q. Why not?

A. Because in determining the amounts of money to be deducted for depreciation which has occurred in this property, it was necessary to make a separation between the re-

production cost of pipe and equipment and the reproduction cost of the protective coating that was on that pipe.

This was true, because in so many instances upon inspection, the only deterioration that could be found was that which had occurred in the paint only, that is, in a great many of the observations; although the value of the paint had almost entirely disappeared, there would still be [fol. 1175] no attack upon the pipe, itself, no evidence whatever of corrosion or of loss in value on the pipe.

Q. And did you personally examine these items and determine that fact? A. I did.

I have before me the notes of my observations upon the paint and its protective coating and upon structures made during the inspection, to which I have previously made some references.

Q. Now, will you proceed to your discussion of what you did with respect to the gathering lines?

A. For example, the field lines in Texas,—I made eight observations upon field lines in this group and found of those eight observations that at three points there were no indications of corrosion, whatever. At two there had been definite indications of attack upon the metal.

Q. What do you mean?

A. Well, that corrosion had marked the metal so you could see it and realize it was there, although it was so small that the depth could not be measured with the ordinary instruments used for such measurements.

Q. When you speak of corrosion, what type of attack upon the metal do you refer to?

A. Just ordinary rust.

Q. Ordinary rust by action of the air and the elements [fol. 1176] upon the metal, is that true? A. Yes, sir.

At three locations, there was definite pitting of the metal. I examined the records of Panhandle Eastern Pipe Line Company of inspections upon pipe and protective coating; in the year 1940 there were 19 such inspections upon Texas field lines.

Combining those with the observations which I, myself, took, there were 12 observations at which there were no surface indications of rust whatever. There were four at

which there was definite surface attack. There were six with very shallow attack upon the metal and five with definite pitting on the pipe. Assigning to those instances where there were no indications whatever of corrosion a relative condition of 98 percent,—this being 98 percent instead of 100 simply because in all probability the pipe isn't perfect,—and 97 percent to those locations where there had been a definite surface attack, assigning 95 percent condition to those locations where there had been shallow metal attacks, and assigning 90 percent to those locations where the depth of pitting was measurable by the usual instruments produces a weighted condition for pipe at these locations of 95.77 percent.

I have, therefore, depreciated those lines by 5 percent.

Q. In all instances?

[fol. 1177] A. Yes, sir.

Now, with reference to the paint on those lines I have tabulated my observations, my conclusions, from my observations as to the condition of paint on these lines and have arrived at an over-all percent condition for paint upon these field lines of 34 percent.

There is some enamel upon some of these field lines, not a great deal, and I have used as a result of these conditions a deduction from Ace paint, that being a cold application, of 50 percent,—70 per cent.

Q. You mean 70 instead of 50?

A. Yes, 70 percent of the reproduction cost in order to obtain the present value, and for the enamel I have made a deduction of 50 percent from reproduction cost in order to obtain its present value.

Now the method by which I have obtained the deduction for depreciation on the gathering lines in Texas, is the manner which I have followed for the other gathering lines and I have thereby arrived at a total deduction for depreciation on gathering lines of $195,613.33, producing a present value as shown on line 12, page 22 of $3,065,772.66.

Q. Which you have carried forward, have you not, to line 80 on page 20? A. That is correct.

Now, on page 23 is shown what I have designated as a [fol. 1178] trunk gathering line.

Q. What is that?

A. That is a 22-inch line which originates at a point about two or three miles south of Sneed station in the Texas Panhandle field.

Q. Is that the place that some people refer to here as Windmill Junction?

A. It is; and runs to Liberal station which is in the State of Kansas and near the town of Liberal, east of the Hugoton gas field.

This line is carried in the company's records, in some places, as a main line designated "Line A-100," the "A" meaning that part of it is in Texas and it is the original line. The Oklahoma portion of it, I think, is designated as "B-100" but it is at least designated as a No. 100 line.

I have chosen to set it aside out of the main line system and designate it as a trunk gathering line.

Q. Why did you do that?

A. Simply to have it separated from the other property.

Q. All right, now will you state what you did in inspecting that line and what conclusions you have arrived at in connection with your Exhibit 62?

A. I have handled my observations on this line in precisely the same manner as that which I have described [fol. 1179] for the gathering lines.

Q. Well, Mr. Biddison, did you examine this line? If so, how did you go about it?

A. I designated locations at which holes were to be dug with a clearance of not less than 18 inches all around the pipe and upon inspection I went into this test hole and examined the pipe wholly around the circumference.

I had four feet of the protective coating, of whatever nature it might have been, removed so I could see four feet of bare pipe and two feet of the protective coating. I made notations as to the conditions of the coating and I made notations as to the condition and appearance of the pipe.

Q. In each instance?

A. Yes, and if there were pits I recorded pit depths measurements, dividing pipe off into four 1-foot sections where it was bare and recording for my own information the deepest pit on each one of those consecutive four 1-foot sections.

Q. How did you select these points for this pit digging or hole digging?

A. It was a purely random selection with the exception that where the company's records indicated that there was material deterioration in the protective coating or that pitting had occurred upon the pipe, I made sure that I had an inspection hole in that area.

[fol. 1180] Q. How did you find out where those points were?

A. By an examination of the records of the tests which the company regularly conducts for such determinations.

Q. How many of these holes did you say you had dug?

A. My last number is No. 116. I think there are one or two locations, however, where there is a sub-number in that connection, so there may be one or two additional locations above the serial numbering of my last page.

Q. It runs up to about 120 places, is that true?

A. That is correct.

Q. And did that give you a reasonable opportunity to inspect your line in question?

A. It did, but I used in addition to my own observations the records of the Panhandle Eastern Pipe Line Company's inspections of 1940.

Q. What were they?

A. They were inspections of precisely the same nature except that in the case of their inspections the length of pipe to be exposed was not specified in advance but was fixed largely by matters of expediency at the time inspection was made.

Some of these inspections were made in connection with repair work being done or with construction work being done and some were made solely and purely for the pur-

[fol. 1181] pose of determining the effects of the time and the elements upon pipe protection and upon pipe, itself.

Q. Now, will you continue with your discussion of the deduction for depreciation which you have determined should be made in respect to trunk gathering lines?

A. I have handled this trunk gathering line in precisely the same manner as I have previously explained for gathering lines and have used in addition to my own observations on this line, six in number, 61 observations from the reports by Panhandle Eastern Pipe Line Company.

I have in that fashion determined a total deduction for depreciation for trunk gathering lines of $136,026.48 producing, by deduction from Column B, the present value shown in Column D of $2,494,557.01.

Q. As you have carried forward to line 14 of page 20?

A. That is correct.

. . . . . .

Q. Now, turn, if you will, to the item headed "Main Lines" beginning on page 24 of Exhibit 62 and state what your methods and conclusions were with respect to the depreciation existing in those lines.

A. I think "Main Lines" might well be explained by taking Kansas Line 100 as an example. The amounts of [fol. 1182] money shown in Exhibit 39 for Kansas Line 100 have, in Column B, page 24, lines 1 to 13 of this Exhibit No. 62, been restated so that a determination might be shown of the loss in value of the protective coating as distinguished from the pipe, itself.

Therefore, at line 2 is shown for Kansas Line 100 the reproduction cost new in Column B of "Pipe and Equipment" and in line 3 the protective coating upon that pipe. In order that I might weigh out the observations which I had made in connection with the information available from the company's records of pipe inspection, I made up an alignment chart upon which I recorded the location of each of my own inspections and of each of the recorded tests in 1940 by Panhandle Eastern Pipe Line Company.

. . . . . .

I recorded on these alignment sheets by the symbol "A" the fact that there were no indications of corrosion at that location.

I recorded by means of the symbol "B" the fact that there was definite surface rust, I recorded by means of the symbol "C" the fact that there had been shallow metal attacked, and I recorded by means of a vertical line the fact that there was pitting and the [fol. 1183] height of that vertical line records the depth of the pits.

The information as to each of these observations is located upon the alignment sheet at the appropriate distance from the point of beginning.

I have then allocated over the length of the line these various conditions and laid them out. I have assumed in this allocation that if condition "A" existed at any one point and condition "B" existed at the next point of inspection that condition "A" would exist half way to that next point and condition "B" exist half way.

Q. Do you believe that to be a reasonable method for the approach to this particular problem?

A. I do. It is the only one which I could conceive to give proper effect to the information that was available.

Q. Now will you proceed to explain that?

A. By assigning to the condition "A", which I have mentioned, a value of 99, to the condition "B" a value of 98, to the condition "C" a value of 97, and to the average of those conditions where pitting existed a value of 95, I find that for the section Liberal station to Greensburg station that the figure 97.65 represents the mean condition or that the pipe has depreciated 2.35 percent in that section.

In the same manner I find that for the complete line C-100 in Kansas, this being the original line, that the [fol. 1184] loss in value so determined is 2.01 percent.

I have, therefore, deducted for pipe and equipment 2.5 percent to produce the amount of $185,752.78 shown at line 2, Column C.

Q. What does that represent, that figure?

A. That represents my estimate based upon these observations of the amount of value which has been lost in the pipe and equipment in this original Line 100 in the State of Kansas.

I produced, thereby, a present value in Column D, line 2, of $7,244,358.54.

On paint for this line, I have assigned conditions for each observation which I made, these conditions representing in each case my judgment of the residual values remaining in that paint and by weighing out these observations on paint I arrive at the conclusion that on this line in Kansas 47 percent of the value of the paint is gone.

Q. How did you get 47 percent?

A. By weighing out these observations, weighing out their values, I arrive at the result that 53 percent remains and by the difference 47 percent is gone. I, therefore, deducted that percentage from the reproduction cost new of paint at line 3 on page 24 and produce thereby a figure of $183,727.37 in Column C which being deducted from Column B gives a present value for the protective coating [fol. 1185] in line 3 of $207,181.92.

I might call attention to the fact that the deduction for depreciation on paint in this instance is very closely equal to the deduction for depreciation on pipe and equipment.

There has been a substantial loss in value on the paint. There has been little loss in value upon pipe. The paint having lost value and being no longer an effective protection against corrosion and pitting, pipe will in the future lose value at a much more rapid rate.

Now, the total deduction on Kansas Line 100 as shown on this page 24, lines 2 and 3, is about $378,500, something on the order of 5 percent of the reproduction cost new of pipe equipment and paint, although it is only about 2.5 percent on pipe, itself, and 47 percent on the protective coating.

Now, what did you do with respect to the river crossings on the Kansas line?

A. On the Arkansas River crossing, inspection was made of the river lines on the flats and those observations are the basis of the assignment of condition to the Arkansas River crossing as a whole.

I have deducted from the reproduction cost new on three river crossings, the Arkansas, the Neosho and the Osage

on Kansas Line 100, 5 percent as a result of observations [fol. 1186] made upon pipe at the Arkansas River crossing.

Q. In other words, you inspected pipe at the Arkansas River crossing and looked at the other situations as to the Neosho River crossing and the Osage River crossing, and assigned the same amount for depreciation on those, the same relative amount?

A. That is correct.

Q. On what ground did you do this, Mr. Biddison?

A. On the probability that they were in about the same condition.

Q. You saw no reason to doubt that fact, did you?

A. That is right. The property is maintained in a highly uniform state of good condition and repair, the whole property is.

Q. Now why do you not show paint from the Arkansas River crossing?

A. Well, my recollection is that there was none on there.

Q. Yes. There was paint on the other crossings?

A. That is correct.

Q. All right, what is your total, then, of depreciation that you have deducted from the Kansas Line 100?

A. The total which I have deducted is $394,513.82, as shown in Column C, line 13, producing the present value in Column D, line 13 of $7,818,798.33.

. . . . . .

[fol. 1187] Q. Well, what other main transmission lines are there in Kansas and what did you do with respect to them?

A. There is laid close to this Line 100 what is sometimes referred to as a loop line and officially designated as Line 200.

Q. What is a loop line?

A. As I have used the term it means a line laid parallel to another line; maybe for an equal distance and maybe for only a portion of the distance and interconnected. This particular loop line referred to is the Liberal loop; it begins at Liberal station and runs eastward. It does not run clear through to Greensburg compressor

station, which is the first compressor station eastward from Liberal on Panhandle Pipe Line Company's system.

Q. But it connects with the Line 100 at some point westerly of the Greensburg station, is that correct?

A. They are interconnected at Liberal station and at the eastern terminus of the loop Line 200 and are interconnected about every eight miles in between.

Q. And are there several loops in Kansas along and parallel to Kansas Line 100?

A. That is correct. Each loop line is commonly re- [fol. 1188] ferred to by the name of the compressor station at its western terminus.

Q. Yes. Now you have shown those all on page 24, have you not, of Exhibit 62? A. Yes, sir.

Q. You have shown also certain river crossings of the loop lines, have you not? A. Yes, sir.

Q. Will you state whether the methods you have used in arriving at deductions for depreciation on Kansas Line 200 are similar to those used for Kansas Line 100 and, if not, will you state the differences?

A. As a result of inspections which I made, I reached the conclusion that on these loop lines the amount of depreciation which had occurred was so minute that it would be very difficult to detect by observation. I had anticipated that that would be the case before selecting the points at which to make observations.

In making the selections of these points to which observations were to be made, I made locations only upon pipe that had been laid in the looping program of 1937.

Q. Why did you take that?

A. Because that is the oldest pipe in the loop lines, in the 200 number lines.

Q. In other words, all pipe in these 200 number lines [fol. 1189] has been laid in 1937 or since that date?

A. That is correct. In 1937 or in '39, '40 and '41.

Q. Then, did you feel that what you did in that connection was a conservative method of arriving at your result? A. Yes, sir.

Q. Will you proceed?

A. I have assigned, on that basis, to the lines constructed in 1937 in the Liberal section, Greensburg section and Haven section, 99 percent as a figure representing

their conditions as respect to new or a loss in value on pipe of 1 percent. This applies to the pipe laid in 1937; for the balance of the pipe I have assigned a condition of 100 percent or no loss in value.

Q. Well, it is almost new, isn't it?

A. Yes, some of it was laid this year.

In the section between Olpe and Lewisburg, I have made a deduction of 2 percent from pipe laid in the 1937 construction program and that is true, also, of the pipe in the Houstonia section, that is, I have deducted 2 percent for depreciation of the pipe laid in 1937.

On all other of the loop lines, I made the deduction for pipe laid in '37 as 1 percent and other pipe has been depreciated none whatever.

In connection with river crossings on these loop lines, [fol. 1190] I have made a deduction of 3 percent on all river crossings as being an average figure of loss in value on those river crossings. These river crossings were laid in 1937.

In this manner I have arrived at the total deduction for depreciation on transmission mains shown in line 37, Column C, of $457,897.07, which is deducted from reproduction cost new which produces the present value figure in Column D, line 37, of $13,388,635.14. This latter figure has been carried forward.

Q. To line 16 on page 20, is that not true?

A. Yes, sir, that is correct.

Q. And that covers then the main transmission lines in the State of Kansas, does it? A. That is correct.

Q. Now, is there anything further that you wish to state with respect to your study of the existing depreciation in such lines?

A. No. The method I have used in connection with the Kansas lines on page 24 is the method used in connection with the other main lines, pages 25 and 26, inclusive.

Q. All right, will you state what the total deduction for depreciation is at which you arrived with respect to the Missouri main line, both Nos. 100 and 200, as shown, I believe, on line 32 on page 25?

A. The amount of deduction as shown in Column C is [fol. 1191] $344,234.86, producing a present value figure in Column D, line 32, of $8,435,603.79.

Q. As carried forward to line 17 on page 20?

A. That is correct.

Q. In your recapitulation of transmission main property?

A. That is correct. And on this same page 25 the deduction for depreciation on Mississippi River crossings, shown on line 40, is $49,228.54 and the resultant present value figure, $396,599.70, are forwarded to page 20 at line 18. From page 26 the Illinois line shown at line 24 with a deduction for depreciation of $205,898.84 and a present value of $6,116,914.95 is carried forward to page 20 at line 19, and the main lines in Indiana shown at line 28 on page 26 with a deduction in Column C of $31.19 and a present value of $630.60 is carried forward to page 20 at line 20.

Q. Now, Mr. Biddison, what is the total deduction for depreciation and your figure of present value for the main lines of the company, the main transmission lines of the company over all?

A. For main lines the total deduction for depreciation, as shown on line 19, of page 26, and as forwarded to line 21 of page 20, is $1,057,290.50 and the present value resulting is $28,338,384.18.

. . . . . .

[fol. 1192] The next item is that of lateral lines, beginning on page 27 and continuing through on page 28. The deductions for depreciation shown in Column C are arrived at for these lateral lines in the same manner as I have previously explained for main lines and the subtotals for the various states shown on those two pages have been carried forward on to page 20 at lines 23, 24, 25 and 26 and the totals for lateral lines from line 10 on page 28 have been carried forward to page 20 at line 27.

[fol. 1193] Q. Will you state what those totals show?

A. The deduction in Column C is $307,488.62, producing a present value of $4,343,955.44.

Q. Now, Mr. Biddison, is there anything in connection with what you have done in respect to these lateral lines

which differs and, therefore, should be explained from what you did in connection with the main lines?

A. No, the method is the same and I have used in connection with the lateral lines the information in the records of Panhandle Eastern Pipe Line Company of their regular pipe inspections.

I did not, however, on the lateral lines weigh out the observations on an alignment chart nor did I have observations upon all lateral lines, but have assigned to lateral lines in the various states the condition figure determined from the lines which were examined.

Q. You believe that to be a reasonable method for arriving at the conclusion to which you have arrived?

A. I do.

. . . . . .

[fol. 1194] A. With respect to the local area lines I wish to point out that with regard to this system there is a group of lines which I have referred to as permanent lines shown in line 2, page 29, which, insofar as one can predict the future, seem to be lines which will be maintained in operation by Panhandle Eastern Pipe Line Company regardless of the future life of gas production in the local area.

. . . . . .

They are transmission lines which feed communities in this area and from this area. They are what would be called in an ordinary classification for a natural gas utility, based upon this local area, their main lines in the transmission system.

. . . . . .

To those lines I have made a deduction of 25 percent of their reproduction cost new.

Q. How did you arrive at that figure?

A. That figure is purely a judgment figure based upon general knowledge of conditions in that area. I did not make specific examinations of those lines.

Q. What is the figure you arrived at?

A. The deduction as shown at line 2, Column C.

[fol. 1195] Q. Page 29?

A. Page 29, yes, which is $153,009.27, resulting in the present value of $459,027.81.

Another classification of lines in this area is the gathering lines. These lines are of a less permanent nature and as a matter of judgment I have deducted from their value, because the producing area has been heavily depleted of its gas reserves, 60 percent.

The amount of deduction is $700,536.75, resulting in a present value of $467,024.49.

Q. As shown on line 6, page 29?

A. That is correct.

Q. Are there other types of lines in this local area system?

A. The third class of lines are the well lines. These well lines are connected to individual wells whose future life is short.

I have made a deduction for depreciation upon these lines based, not upon their physical condition, but upon prospective obsolescence, upon depletion of the reserves and I have deducted 80 percent of their value from reproduction cost new. The amount of the deduction shown on line 14, page 29, is $78,466.43, resulting in a present value of $19,616.60.

Q. Will you please now state the total with respect [fol. 1196] to the local area lines?

A. The total deduction and total present value, as shown on page 29, line 15, for local area lines and carried forward—

Q. (Interposing) To line 32 on page 20?

A. Yes, to line 32 on page 20, is for deduction $932,012.45 and for resultant present value $945,668.90.

Q. Will you now please state the total figures which you have arrived at with respect to transmission mains?

A. The total deduction, as shown in Column C, line 33—

Q. (Interposing) Page 20?

A. Page 20, is $2,642,841.44, with a resultant present value of $39,318,028.71, which figures have been carried forward.

Q. To line 14 on page 2? Is that correct?

A. That is correct.

. . . . . .

On page 30 is shown a summary of the reproduction [fol. 1197] cost new, deduction for depreciation and present value for compressor stations.

. . . . . .

The total deduction for depreciation for compressor stations as shown at line 18, Column C, page 30, is $628,607.30, with a resultant present value of $9,135,536.30.

Q. As carried forward to line 15, page 2. Is that correct?

A. That is correct.

Q. Now, will you please discuss this item of compressor stations, using such examples as you deem pertinent to explain what you did and how you arrived at this conclusion.

A. The determination of the deduction for the individual stations is shown on subsequent pages 31 to 42, inclusive.

Q. Of Exhibit 62?

A. Yes, sir.

Upon my inspection trip over this property I made notations of the condition of various items of this property. The largest single items in compressor stations, as to value, are the main compressor units.

Taking Sneed Station as an example, on page 31 at line [fol. 1198] 2, are shown the main compressor units at a reproduction cost new of $270,346.72, with a deduction for depreciation of $19,600.14 and a resultant present value of $250,746.58. This is a deduction on these units of 7.25 percent.

Q. How did you arrive at that figure?

A. I have estimated that these units could operate a total of 325,000 engine hours, each. As of the close of June 1941, one of these units had operated 29,500 hours. One of them had operated 29,700 hours. One of them had operated 30,400 hours. One had operated 4,300 hours.

If we estimate the depreciation to be in proportion to the engine hours operated—

Q. (Interposing) You believe that to be a reasonable method?

A. With some qualifications.

Q. Yes, will you state those after you have concluded?

A. If we estimate that depreciation has occurred in proportion to the engine hours operated, then these four units, by virtue of the engine hours which they have operated have lost 7.22 percent of their value.

I have deducted 7.25 percent. I would like to explain that an inspection of these engines shows little in the way of depreciation to have actually occurred upon them. The engine which has operated 4,300 hours, so far as one can tell by its appearance, is in the same condition as the [fol. 1199] one which has operated 30,400 hours.

I reached the conclusion from an examination of records of wear upon pistons, upon cylinders and upon rods that unless some other damage ascertainable by inspection existed that it was reasonable to depreciate these engines on the basis of the engine hours which they had operated, predicated upon 325,000 total engine hours. For engines of some other make or size, I would predicate their life upon a different number of total engine hours.

Q. How did you arrive at the total engine hours for the gas-driven engine compressors at this Sneed compressor station?

A. That is a matter of judgment. Three hundred twenty-five thousand hours is about 40 years of continuous operation. I know of units that have been maintained in operation for comparable periods, not continuous operation, but I think it is possible that if use be had for this class of equipment that it can be kept in operation for some such periods.

We are going to have to have several generations of experience with equipment of this sort before anybody can say what the average life of one of those units is.

Q. At any rate, they have a long life, do they not, as compared with many types of machinery?

A. They do.

[fol. 1200] Q. And the figures you have given represent your best judgment after inspecting them with care, is that correct?

A. That is correct.

I would like to point out while I am on that subject that these engines are 24 x 36 units, 1300 horsepower. At Liberal station the units are 21½ x 36, 1000 horsepower each. I have assigned to them a total possible life of 350,000 engine hours.

Q. Why?

A. Because my experience with that particular type of engine is that it is a smoother running machine, some of which are now operating after some 30 years of use and are in good condition today.

Q. Still operating? A. Yes, sir.

To the main units at Olpe, Centralia and Pleasant Hill stations, and at this Olpe Station, which are 24 x 36 units, 1300 horsepower each, I have assigned total lives of 300,000 engine hours each and to the main units at Hansford, which are vertical high speed, 600-horsepower units, I have assigned a life of 200,000 engine hours each. I have also assigned that life to the 600 horsepower units in Tuscola station.

Q. Do you believe these assignments of life are reasonable, based upon your experience?

[fol. 1201] A. Yes, sir.

Q. And what have been the general results of the study you have thus made?

A. The general results of the studies I have made in that fashion on these main compressor units is that for the Hansford units installed last year I have made a deduction of 1.25 percent, for the Liberal units I have made a deduction of 7.5 percent, for the Greensburg units I have made a deduction of 4.5 percent, for the Haven units of 5.5 percent, for the Olpe units 5 percent, for the Lewisburg units 6.5 percent, for Houstonia units 5 percent, for the Centralia units 5.75 percent, for the Pleasant Hill units 4.25 percent, for the Glenarm units 5 percent, for the 1300-horsepower units at Tuscola 5 percent, for the small vertical units at Tuscola 2.25 percent. These percentages are

rounded figures, in general slightly over the calculated figures.

* * * * * * * *

Q. Is it a fact that these large compressor units are the primary items in value of these compressor stations?

[fol. 1202] A. Yes.

Q. And in the items of equipment contained at the compressor stations?

A. Yes, that is true.

Q. Now, will you turn back to page 31 for a moment, headed "Sneed Compressor Station" and state whether all of the other items contained on that page are items of equipment or buildings or machinery used in connection with the operation of these main compressor units?

A. That is correct.

Q. And will you state the figures you arrived at with respect to the total property at the Sneed compressor station?

A. By applying to the other individual items, that is other than gas engine-driven compressors, percentages of value to be deducted for depreciation sustained, I have arrived at a total deduction for Sneed compressor station as shown at line 45, Column C, of $45,839.17, which produces the present value figure in Column D of $605,118.71.

Q. Carried forward to line 1 on page 30, is that true?

A. That is correct.

Q. Let me ask you whether the methods which you have just stated with respect to the Sneed compressor station and the buildings and apparatus there contained are the [fol. 1203] same methods which you followed with respect to the other compressor stations of this company?

A. They are.

Q. As listed on the following pages of this exhibit, to wit, 32 to 42, inclusive?

A. Yes, sir.

Q. Now, will you state what the total deduction for depreciation is which you have arrived at and shown on page 30 for all the compressor stations of this company?

A. The total deduction which I have arrived at for compressor stations shown on line 18, page 30, is $628,607.30 with a corresponding present value of $9,135,536.30.

Q. Now, that includes, does it, the following stations, to wit, Sneed compressor station, Hansford compressor station, Liberal compressor station, Greensburg compressor station, Haven compressor station, Olpe compressor station, Lewisburg compressor station, Houstonia compressor station, Centralia compressor station, Pleasant Hill compressor station, Glenarm compressor station, Tuscola compressor station, Sneed dehydration equipment, local area compressor stations consisting of Wea compressor station, Rantoul compressor station and Dodson compressor station?

A. That is correct, and with reference to the last three, they being the compressor stations in the local area, I have depreciated them down to what I estimate to be their sal-

[fol. 1204] vage value.

Q. So that you have very little left of present value for them?

A. That is correct, I have 10 percent remaining for Wea, 10 percent remaining for Rantoul and 20 percent remaining for Dodson.

Q. And why did you depreciate these to such a large degree?

A. Because of early obsolescence caused by depletion of gas supply in the local area.

Q. Yes, and are the total items with respect to compressor stations, which you have just read, carried forward to line 15 on page 2 of Exhibit 62?

A. They are.

Q. There is one other item under your heading of "Transmission Property" and that is the "Other Transmission System Equipment"; state what that is and where it is shown on Exhibit 62 and the amounts you have arrived at for deduction for depreciation.

A. The item is shown on page 43.

Q. What do they consist of, in general?

A. Some boarding house equipment, some miscellaneous stuff, the cattle guards in the gas fields, fence gates in the gas fields, the pipe racks along the transmission lines for holding pipe to be used in emergency repair work.

[fol. 1205] Q. And do you also include the equipment on those pipe racks?

A. And the equipment on those racks.

Q. All right, now, Mr. Biddison, what is the figure you find for depreciation in this miscellaneous group of items and how did you arrive at it?

A. The figure found to be deducted for depreciation on this equipment, and that is shown on line 16, is $11,936.13, producing a present value of $116,721.36.

Q. As carried forward to line 16 on page 2?

A. That is correct.

* * * * * * * *

Mr. Williams: On line 17, page 43, there appears the item "Equipment on Pipe Racks.":

Mr. Wheat: Yes.

Mr. Williams: My assumption is that that is not material and supplies, but I would like to be certain of that.

* * * * * * * *

The Witness: That is not in the material and supply account and the amount of that equipment was determined by a field inventory which I had taken in connection with [fol. 1206] the preparation of my estimate of cost of reproduction cost new, Exhibit No. 39.

Mr. Williams: Will you state, generally, why you consider that a proper inclusion in the rate base instead of including it in operating expense? That is the equipment on the pipe rack.

The Witness: Well, it could not under any conception of accounting be an operating charge. Now, it could have been carried in their stores account, but it wasn't and isn't. It is material which they own, have on hand, it is there for the purpose of emergency use and if is not carried in stores account because in emergencies the operators want to be able to take that material and use it any place any time that it is needed, without going through the formality of requisitions and transfers in order to get it out of stores.

By Mr. Wheat:

Q. Isn't it just exactly the same with respect to the pipe line and just as much a part of the pipe line as a spare tire is that is carried on an automobile?

A. Certainly it is.

Q. And isn't it, in essence, that type of property?

A. The pipe, as a matter of fact, on their books, this equipment on their books has been charged to investment. I have it in investment, but I do not have the investment as [fol. 1207] part of the pipeline. I separated it out.

. . . . . .

Q. All right, now, Mr. Biddison, will you turn to page 44 and tell us what is shown there?

A. Panhandle Eastern Pipe Line Company, in order to offset the effects of corrosion upon steel pipe, has in the last few years at locations where corrosion was making itself evident, installed electric generators to neutralize the current flowing from pipe to ground and thereby prevent corrosion and pitting.

This equipment is referred to as cathodic protection equipment. Some of it is windmill driven, some of it is driven by gas engines.

Q. How much depreciation did you find in that item on that account?

A. I found as a result of observation and as a result of information derived from company records that there should be deducted for loss in value on this equipment $6,486.65, which results in a present value of $33,289.79, as shown, respectively, in Columns C and D at line 18, page 44. Those amounts have been carried forward to line 11 on page 43 and incorporated with other transmission system equipment.

. . . . . .

[fol. 1208] Q. And which has been carried forward to line 16 on page 2?

A. Yes.

Q. All right, now, Mr. Biddison, what have you to say with respect to the Liberal gasoline plant? What did you do in arriving at the deduction for depreciation and what were your methods?

A. I think, Mr. Wheat, before I pass on to that I should explain with reference to page 12.

Q. All right.

A. That with respect to transmission system land and transmission system rights-of-way, lines 1 and 2, I have

made no deductions for depreciation on those two items. Depreciation has not occurred in land nor right-of-way.

Now, with reference to Liberal gasoline plant, that is shown on page 45 of Exhibit 62, to the individual items of reproduction cost new, as shown in Column B on this page, I have applied percentages representing the proportions of value which I estimate to have been lost in these items due to wear and tear and to all causes of depreciation to produce the individual amounts to be deducted for depreciation shown in Column C and through those deductions have obtained the individual items of present value shown in Column D.

[fol. 1209] Q. These are based, are they, on your judgment based on an inspection of this property?

A. Yes, they are.

Q. What are the items, what is the amount?

A. The total to be deducted for depreciation, as shown at line 40, is $37,690, resulting in a present value of $583,820.23.

Q. As carried forward on line 19, page 2, is that correct? A. That is correct.

Q. Now, will you state the figures with respect to the total transmission system on line 17 on page 2? I don't think that has been stated here.

A. I have previously explained the derivation of the individual items on page 12, this being a summary of transmission property at line 13, Column D. I arrive at a total deduction for depreciation of transmission system property of $3,372,444.98, with a resultant present value in Column D of $50,794,738.64, these figures being the ones carried forward to line 17 of page 2.

Q. Thank you.

Now, will you turn, Mr. Biddison, to page 46 of your Exhibit 62 where, under the heading of "General System Property" you have included certain items. Will you state what those items are, where the details are shown in [fol. 1210] the exhibit and what your methods were and what your general deduction for depreciation was?

A. The first item on page 46 is that of "General Office Equipment." From this I have deducted 15 per cent of its reproduction cost as a measure of the depreciation that

has occurred in that property; the amount of the deduction is $11,712.35 and the resultant present value is $66,370.01. There are no details subsequent in this report.

Q. What is the next item?

A. The next item is "General Transportation Equipment" on which I have shown in line 2 a deduction of $21,702.18 and a resultant present value of $88,269.72. In connection with this item detail will be found as to individual units on pages 47 to 49, inclusive.

Q. Tell us how you arrived at these figures.

A. As to automobiles and trucks, I have estimated that automobiles would have an ultimate life of 100,000 miles.

Q. Is that based on your experience and the experience of this company?

A. It is. This does not mean that Panhandle Eastern Pipe Line Company proposes to drive automobiles 100,000 miles before disposing of them. It means, in fact, that they will drive these cars about 50,000 miles each and dispose of them at 50 percent of their cost, so the assumption [fol. 1211] of 100,000 miles total life is in line with the Panhandle Eastern Pipe Line Company's policy as to trading in of cars and as to their experience as to their life.

Q. They have had that experience, have they?

A. Yes, sir, and it is an experience which I have encountered in my analyis of other situations.

As to trucks I have used the figure of 75,000 miles and I have depreciated automobiles and trucks on the basis of these ultimate lives in proportion to the mileage which they have traveled as of the close of June 1941.

Q. Well, let's take as an example the Ford, Tudor sedan, I suppose it is, listed on line 2, page 47 of Exhibit 62, car No. 653.

A. The mileage recorded on that car was 34,797 miles, which is 34.8 percent in round numbers of 100,000 miles and its reproduction cost new was $826.91 and 34.8 percent of that is $287.76 and that is the amount of the deduction for that car to obtain its present value of $539.15.

Q. How did you get the reproduction cost new item of $826.91 that you list here on page 47?

A. That is the amount of money that Panhandle Eastern paid for the car when new.

Q. That is not an attempt to find out how you could build that car new today, is it?

A. No, that is just the price of it, that is all.

. . . . . .

[fol. 1212] That method was used as to automobiles and trucks. The amount of depreciation set up against trailers and winches is my judgment of the amount by which those items have been depreciated after having seen a considerable amount but not all of that equipment.

Q. Well now let's take trailers, line 23, page 49, where you show $2,463.40 as deductible for depreciation and where you show present value $7,390.13. That is the item you have just referred to as trailers, is it? A. Yes, sir.

Q. And that is a judgment figure? A. That is correct.

Q. Now take winches, line 24, page 49, where you show to deduct for depreciation $1,187.37 and where you show present value $3,562.11, there, again, you have used a judgment figure as so stated, have you?

A. That is correct and the deduction is 25 percent of their cost.

Q. All right, now will you state the totals with respect to general transportation equipment?

A. The total deduction shown on line 25, page 49, is [fol. 1213] $21,702.18 with a resultant present value of $88,269.72.

Q. As carried forward to line 2, page 46. Is that correct? A. That is correct.

. . . . . .

Q. Will you turn now to the subject of general laboratory equipment as shown on page 46, line 3, and state what your results were and how you arrived at them?

A. As a matter of judgment, having seen some of this equipment I made a deduction of 20 percent of its reproduction cost for depreciation thereon in the amount of $1,310.14 with a resultant present value of $5,240.57 as shown at line 3 on page 46.

Q. Do you believe that to be a reasonable amount for that deduction? A. I do.

Q. Now, will you turn to the subject of general communication equipment and state what the figures are, where they are shown and what your methods were?

A. This general communications equipment consists of a telephone line and its necessary appurtenances, the line running from Kansas City to the Hugoton field and into the [fol. 1214] Panhandle field.

I made observations on this telephone line at various points during the course of my inspection. As a result of those observations from the main line in Texas I deduct 10 percent for depreciation, for the tools in Texas I deduct 25 percent, for the main line in Oklahoma I deduct 10 percent, for the main line in Kansas I deduct 10 percent and for the tools in Kansas I deduct 25 percent.

Q. Based on your experience and your observation of this particular equipment you believe that to be a reasonable deduction? A. I do.

Q. What are the figures you found?

A. I find for general communication equipment a total deduction of $49,690.12 with a resultant present value of $443,018.17.

Q. As carried forward to line 4, page 46?

A. As shown on that line of that page.

Q. Yes. And this is a figure which has been based upon your experience and your inspection of this property, is it? A. That is correct.

Q. All right, now for the last item under "General System Property" appears to be general tools and implements as shown on line 5, page 46. Please explain that item.

[fol. 1215] A. For this equipment I have made a deduction of 25 per cent of its value.

Q. What is that?

A. This consists of tools, tractors, excavating machinery and, in general, the tools and equipment used in the maintenance and operation of the pipe line system.

Q. Why did you arrive at 25 percent for a deduction?

A. Well, I have seen a great deal of this equipment on this system and I am familiar with the condition in which tools for such operating organizations are usually found to be.

Q. Well, are these found to be in that condition?

A. That is my estimate of the condition that they are in.

Q. All right, what are the figures?

A. The amount which I have found to be deductible is $10,062.97 with a resultant present value of $30,188.89.

Q. Now, Mr. Biddison, will you state what your conclusions are with respect to total general system property as shown on line 6, page 46?

A. That there should be deducted from reproduction cost new $94,477.76 which produces a present value of $633,087.36.

Q. As carried forward to line 27, page 2?

A. That is correct.

[fol. 1216] Q. Now, will you state, Mr. Biddison, what the deduction for depreciation is that you have found on total direct construction cost?

A. The sum of all of the deductions for depreciation which I have determined and generally explained is, as shown, on line 28 for direct construction cost.

Q. Page 2?

A. Page 2, $3,695,761.90 resulting in a present value for the direct construction costs of $62,633,741.69.

Q. Mr. Biddison, you did not deduct anything on the item of intangible fixed capital, did you?

A. I did not, nor on the item of construction work in progress nor on working capital nor on the value of gas purchase contracts nor on the cost of business development. I did, however, make a deduction for depreciation upon undistributed construction expenditures shown on line 31 on page 2 of this exhibit.

Q. In what amount?

A. In the amount of $425,987.90, with a resultant present value of that item of $7,221,909.68.

Q. How did you arrive at that deduction?

A. That deduction bears the same relation to the reproduction cost of that item as does the total deduction bear to the total of direct construction cost.

[fol. 1217] Q. In other words, you used a similar proportion, did you? A. Yes, sir.

Q. And why?

A. Because as items lost value I think the undistributed general costs incurred on them lost value correspondingly and to the same degree.

Q. Well, having made that deduction, what is your figure with respect to the deduction for depreciation for

the total plant property and business of Panhandle Eastern Pipe Line Company?

A. $4,121,749.89 as shown on line 37, Column C.

Q. And from what figure do you deduct that amount in order to arrive at your statement of present value?

A. From a reproduction cost new, as shown in Column B of $83,833,448.54.

Q. Which is the figure shown, is it, in Exhibit 39 as amended by Exhibit 39-A? A. That is correct.

Q. And what is your final figure at which you arrived in Exhibit 62?

A. $79,711,698.74 as shown in Column D, line 37, page 2 and as mentioned in the letter of transmittal upon page 1.

* * * * * * * *

[fol. 1218] Q. Have you also developed a book containing numerous photographs of the actual inspections which you made during this study?

A. I have and it is available. I have been carrying it back and forth here. I just got tired carrying it and didn't bring it today.

* * * * * * *

Trial Examiner: Exhibit 62, which is, shall we say, supplemental to proposed Exhibit 39, is now offered in evidence, and the ruling on its admission will be deferred until after cross-examination.

* * * * * * *

Mr. Littman: Mr. Biddison, do I understand that this Exhibit No. 62 contains in Column B your estimate of the [fol. 1219] reproduction cost new of the plant property and business of Panhandle Eastern Pipe Line Company and Illinois Natural Gas Company as of June 30, 1941?

The Witness: Yes, those figures being obtained either directly from Exhibit 39 or 39-A or from the working papers from which they were compiled. The arrangement of the items in Column B of Exhibit 62 is not in all cases identical with the arrangement in Exhibit No. 39 or 39-A.

Mr. Littman: Do I also correctly understand that your Column C contains throughout this exhibit your estimate of observed [to] depreciation?

The Witness: It does.

Mr. Littman: Am I also correct in understanding that figures in this exhibit shown in Column D show your estimate of reproduction costs new less your observed depreciation?

The Witness: That is correct, and that is obtained by deducting Column C from Column B.

Mr. Littman: In other words, it is reproduction cost new less depreciation that you mean by the term "present value," is it not?

The Witness: Well, no, it isn't.

Mr. Littman: What is it?

The Witness: What I mean by the term "present value" is present value. Now, I have arrived at present value by exactly the process which you mentioned, by [fol. 1220] deducting from reproduction cost new the observed depreciation, and I have labeled the answer "present value." It is, also, in this case, reproduction cost new less the observed depreciation.

Mr. Littman: In other words, the one is synonymous with the other?

The Witness: In this case it is.

Mr. Littman: That is in your opinion?

The Witness: In my opinion, of course, yes, sir.

Mr. Littman: Thank you.

Mr. Wheat: May I ask this question? Mr. Biddison, when you use the term "observed depreciation" you include all of the types of depreciation whether calculated or actually observed or otherwise arrived at by processes of judgement which you have discussed in your direct testimony in respect to Exhibit 62?

Mr. Littman: Just a minute, I object to Mr. Wheat testifying here for this witness. I believe the witness has already explained what he meant by what he included in Column C. I object to this question, if Your honor please.

Mr. Littman: Certainly it is leading if nothing else. [fol. 1221]. Mr. Wheat: That is correct. It is objectionable from that ground.

Mr. Biddison, when you, in response to a question by counsel for the Commission, stated that Column C contained figures which are observed depreciation, did you refer to figures arrived at in all the methods which you have explained in your direct testimony in connection with Exhibit 62?

The Witness: Certainly, because I have included all those methods in that column as I have just been explaining here this afternoon. I might better have used the word "determined depreciation" rather than "observed" but I have not restricted myself as to the word "observed" to only that which I saw in compiling Column C and I have so testified otherwise this afternoon.

[fol. 1222] Mr. Gorman: If the Examiner please, Commission's counsel would like at this time to state our [fol. 1223] objection to the receipt in evidence of the exhibits in this proceeding which have heretofore been offered by the Respondent, Panhandle Eastern Pipe Line Company, concerning the reproduction cost less depreciation of the property of this Respondent.

We object specifically to Exhibit No. 37, both parts 1 and 2, entitled "Panhandle Eastern Pipe Line Company, Market Value of Leases"; Exhibit No. 38, entitled "Basic Statistics Used in Calculating Interest, Ad Valorem Taxes and Operating Expense [Attributable] to Unused Capacity" and also "Five Different Methods of Calculating Interest, Ad Valorem Taxes and Operating Expense Attributable to Unused Capacity"; Exhibit No. 39 entitled "Panhandle Eastern Pipe Line Company and Subsidiary Companies, Reproduction Cost New of Plant Property and Business as of June 30, 1941, P. McDonald Biddison, Consulting Engineer Dallas, Texas;" and the modification of that exhibit designated as Exhibit No. 39-A; and Exhibit 62 entitled "Panhandle Eastern Pipe Line Company and Subsidiary Companies, Deduction from Cost of Reproduction New for Depreciation and Present Value of Plant, Property and Business as of June 30, 1941."

We also move to strike all testimony concerning reproduction cost given in connection with these exhibits, on the ground that all of such evidence is incompetent, irrelevant, and immaterial in this proceeding in that such evi-
[fol. 1224] dence of reproduction cost has no bearing on and is unnecessary to the determination of the proper base for rate-making purposes in this case.

I should like to say at this point, while we object to Exhibit No. 62 our objection goes to the basis that this exhibit is set up on values, on amounts of reproduction cost new and what was purported to be an estimated depreciation of the property as of June 30, 1941, which was also set up on a dollar value. In making objection to this exhibit we want it to be understood that we do not object to any attempt, a proper attempt at least, of this Respondent, to show what is estimated to be the accrued depreciation in Respondent's property as of any particular given date.

This proceeding, as we all know, was instituted pursuant to the provisions of the Natural Gas Act, and when I say "this proceeding" I include, of course, the matter at Docket No. G-200 as well as the matter at Docket No. 207. Since this is true, your special attention is invited to Section 6(a) of the Natural Gas Act, which reads as follows:

"The Commission may investigate and ascertain the actual legitimate cost of the property of every natural-gas company, the depreciation therein, and, when found necessary for rate-making purposes, other facts which bear on the determination of such cost or depreciation and the fair value of such property."

[fol. 1225] Now, as the Examiner and the parties to this proceeding have doubtless observed, this language is identical with the language contained in Section 208(a) of the Federal Power Act, excepting, of course, that the words "natural-gas company" have been substituted for the words "public utility" as contained in the Power Act.

Since this is true, any construction of Section 208(a) of the Federal Power Act would be equally applicable

and of as great weight when applied to Section 6(a) of the Natural Gas Act, and contrariwise.

The Commission has not, as yet, been confronted with a case involving or requiring a ruling as to the effect and intent of Section 6(a) of the Gas Act. It has, however, placed its interpretation of the import of Section 208(a) of the Power Act, as evidenced by its Opinion No. 63, at Docket No. IT-5500, in the matter of Chicago District Electric Generating Corporation, which was issued as of July 16, 1941.

The Examiner is, of course, familiar with that decision, and I am sure counsel for all parties to this proceeding are likewise acquainted with it. However, I should like to point out certain salient features of that case and the statements of the Commission concerning them, because of the close analogy between the facts related to the Chicago District case and the facts of the proceeding in which we are here engaged.

[fol. 1226] At the outset of its opinion, the Commission undertook to point out that the cost records of the Chicago District Corporation "are complete and well maintained." That there was "no difficulty whatever in ascertaining promptly and accurately from the books of the Respondent the cost of, or the prudent investment in its property." That is cited from page 7 of the opinion.

The Commission then, upon consideration of Section 208(a) of the Power Act, found that Congress thereby "clearly evinced a definite departure from the fair value doctrine of Smyth vs. Ames" (169 U. S. 488-1898) (page 8). That "Congress recognized the fair value doctrine as an impediment to rate making. It saw plainly the lack of practical workability in the requirement that we," that is the Commission, "be compelled in all rate cases to enter into the elaborate investigations and determinations implicit in any reproduction cost finding when, in most cases, there would be no necessity for any such determination."

The Commission then went on to say "we were directed to determine facts other than actual legitimate cost bearing on the fair value of a utility company's property in those situations when we found it necessary in order to do justice in the rate-making process. It was recognized

that there might still be some instances of companies subject to our jurisdiction whose historical records were not [fol. 1227] in such shape that the prudent investment in the property might be accurately determined."

The Commission reached the climax in this phase of its opinion when it said: "It would appear, therefore, that this section (and here, again, we would like to emphasize the identity between Section 208(a) of the Power Act and, Section 6(a) of the Gas Act) contemplates the ascertainment of facts other than the actual legitimate cost which bear upon the fair value of the company's property in rate-making procedures when the exigencies of the particular situation require such a determination. In the normal case we were, directed, however, only to determine the actual legitimate cost and the depreciation (that is, the prudent investment) of the utility's property."

The position taken by the Commission in the Chicago District case may well be summarized in the following sentence taken from its opinion:

"Reproduction cost evidence is inherently fallacious and should be confined to those rare cases where evidence of original cost or prudent investment cannot reasonably be assembled."

Therefore, from a reading of this decision of the Commission, with particular reference to those passages which we have quoted, it appears clear and certain that the Commission does not propose to entertain any consideration of [fol. 1228] evidence of reproduction cost in those "normal" cases where the company's "cost records are complete and well maintained" and where there "is no difficulty in ascertaining promptly and accurately from the books of the Respondent the cost of, or the prudent investment in its property," but to the contrary has clearly manifested an intention to consider reproduction cost evidence only in "those rare cases where evidence of original cost or prudent investment cannot reasonably be assembled."

We submit to the Examiner that this instant proceeding falls within the Commission's classification of a "normal" case where reproduction cost is not pertinent. Here the cost records are "complete" and the cost of Respondent's

property can be "promptly and accurately" ascertained from the books of Respondent.

The truth of this statement is evidenced by the fact that the Panhandle Eastern Pipe Line Company was obviously in a position to ascertain from its books and records not only the amount invested in its property, but to set forth in itemized detail the actual growth of this investment as shown on Exhibit 52 which has been offered by this Respondent.

It is probably true that this Exhibit 52 reflects the "book cost" and does not necessarily purport to be the "actual legitimate cost." This distinction, however, can be of little service to the Respondent in this proceeding because [fol. 1229] the "book cost" and the "actual legitimate cost" are said to be practically one and the same as witness the statement of Mr. Watkins, secretary and controller and chief accounting officer of the Panhandle Eastern Company, who said at page 926 of the transcript as follows:

"It is my opinion, based upon my experience with this company, and also my knowledge of the way in which its books have been developed, that when it becomes possible to make the filing required by the Commission, order No. 73"—and he was referring to the statement of original cost—"there will be very little, if any, difference between the investment of the company in properties as shown by its books, prior to the adoption of the Commission's Uniform System of Accounts, and the amounts to be reported as original cost."

While we feel bound to construe Section 6(a) of the Natural Gas Act precisely as the Commission has construed the language of Section 208(a) of the Federal Power Act, and while we feel that the Trial Examiner is also bound by such construction, we should like to point out here that this construction is not necessarily original with the Commission, itself.

At the annual meeting of the American Bar Association held on September 9-10, 1940, the "Report of the Special Committee to Report on Recent Development In the Field of Public Utility Valuation and Accounting" speaking

[fol. 1230] with reference to these sections of the Power Act and the Gas Act, which we have been discussing, said at page 14 of such report:

"It will be noted that the primary duty of the Commission (speaking of the Power Commission) under these two provisions is to ascertain the cost of the property and the depreciation therein and that 'other facts which bear on the determination of such cost or depreciation, and the fair value of such property' are to be determined only 'when found necessary for rate making purposes.' There is here the possible inference that the Congress, when it drafted this provision, was hopeful that the courts would decide that nothing other than the 'actual legitimate cost' of the property would be 'found necessary for rate making purposes.' However, that may be, it is patent that an accounting or cost rate base was dominant in the Congressional mind: and that these very recent statutes in that respect are the vary antithesis of some of the older state statutes which prescribe the reproduction cost new less depreciation formula."

As further proof of our contention that reproduction cost is not necessary to a determination of the proper base for rate making purposes in this proceeding, we desire to invite the Examiner's attention to other facts which are cognate to this question, but are distinguished from the reasons stated by the Commission in its opinion [fol. 1231] as to why a consideration of reproduction cost is unnecessary in the "normal" case.

In the McCardle case, that is, McCardle vs. Indianapolis Water Company (1926), cited at 272 U. S. 400, 411, the United States Supreme Court said:

"Undoubtedly, the reasonable cost of a system of waterworks, well planned and efficient for the public service, is good evidence of its value at the time of construction. And such actual cost will continue fairly well to measure the amount to be attributed to the physical elements of the property so long as there is no change in the level of applicable prices."

This statement was cited again in the case of Los Angeles Gas & Electric Corporation versus the Railroad

Commission of California, 289 U. S. 287 (1933) and the same theory was there upheld by the Court.

In the case here before the Examiner, the Respondent has not been heard to contend that there has been a "change in the level of applicable prices" to the extent that the "actual cost" does not "continue fairly well to measure the amount to be attributed to the physical elements of property." On the contrary, the evidence offered in this proceeding by the Panhandle Eastern Pipe Line Company would refute any such contention if it were so advanced.

Exhibit 52 shows that the "Total Gas Plant Classified" as of June 30, 1941, is shown on the books as being $64,-[fol. 1232] 622,148.66. Of this amount, plant property requiring an investment of $7,571,851 was in place on December 31, 1930. This is equivalent to 11.7 percent of the total investment. In addition, at the end of the year 1930, the work in progress represented a required investment of $23,462,004, which is equivalent to 36.3 percent of the total investment. Since this work representing a total of 48 percent of the total investment of Panhandle Eastern Pipe Line Company was actually in progress during the year 1930, it was unquestionably contracted for at 1930 or higher price levels.

Exhibit 52 shows that during the year 1931 further additions to the system property were made which are said to have a book value of $10,781,926. This is equivalent to 16.7 percent of the stated book value of all property at June 30, 1941.

Additional construction of a stated book value of $3,-945,873 was completed in 1936, which was 6.2 percent of the whole. At the end of this year there was work in progress entailing an investment of $503,061, or 0.8 percent of the whole, which was contracted for at 1936, or higher price levels.

In 1937 property having a book value of $11,684,833 was added to the system. This investment was 18.1 percent of the entire stated book value.

Finally in 1940 property having a stated book value of [fol. 1233] $5,154,363 was added, which is equal to 7.97

percent of the whole. Also there was under construction at the end 1940 work, contracted for at 1940 or higher price levels, entailing an investment of $688,812 or 1.7 percent of the whole investment.

Having thus considered to some extent the growth of the property and the years when the greatest amounts of money are shown by Respondent's records and the testimony of its witnesses to have been invested, let us now consider the question of whether there has been any material changes in the price levels.

For this purpose, and for this purpose only, we will adopt the United States Department of Labor—Bureau of Labor Statistics—Index Numbers of Wholesale Prices of All Commodities—as shown on Exhibit A to Exhibit 61 for identification which has been offered in this proceeding by Dr. Friday. In considering the yearly comparison which we here offer, we ask the Examiner to keep in mind that the percentages of dollar investment, to which we refer, are, in fact, the percentages of the total investment in plant property, which are shown on Exhibit 52 to have a grand total of $64,622,149 as of June 30, 1941.

In 1930, as we previously stated, there was contracted for property having a total value on the books of $31,033,855 which represented 48 percent of the total value [fol. 1234] of the property used and useful according to Exhibit No. 52 on June 30, 1941. The average price index for the year 1930, when 48 percent of this property was installed, was 86.4 percent, whereas the average price index for the first six months of 1941 was 83.0 percent.

In 1931, a $10,781,926 investment was made which is 16.7 percent of the total. The average price index for this year was 73.0, the average price index as stated for the first six months of 1940 was 83.0.

In 1936 an investment was made of $4,448,934 or 7 percent at an average yearly index figure of 80.8.

In 1937, $11,684,833 was invested which was 18.1 percent of the whole and the average price index for that year was 86.3.

In 1940, $5,843,175 was invested which was 9.7 percent of the whole and the average price index for that year was 78.6.

From these comparisons, or this tabulation, it will readily be seen that approximately 66.1 percent was constructed in 1930 and 1937, that is, 66.1 percent of the total investment of Panhandle Eastern, as shown on its books, was made during years when the yearly index was at least 3.3 above the average of 83.0 for the first six months of 1941.

Approximately 7.0 percent of the total was invested during a year when the index was 2.2 below the 1941 figure [fol. 1235] of 83.0. Approximately 9.7 percent of the total was invested during a year when the index was only 4.4 below the 1941 figure of 83.0 and finally only 16.7 percent was invested in a year when the index was 10.0 below the 1941 index figure of 83.0. The aggregate investments made in the years referred to represent about 99.5 percent of the total; the remaining ½ of 1 percent having been made during the other six years of Respondent's corporate history.

The weighted average of these figures and the yearly indexes which I have mentioned shows that 99.5 percent of the total invested property, as of June 30, 1941, of this Respondent, was made at a weighted index average for these years of 82.96 which is precisely four-hundredths of 1 point below the average index for the first six months of 1941.

Yet, despite the fact that when considered as a whole, the foregoing comparisons of yearly index numbers of commodity prices, upon which Respondent relies, conclusively show that there has been no material change in price levels over the indices for the years when the property was constructed, the Panhandle Eastern Pipe Line Company is here contending that the reproduction cost new of its property would entail an investment of more than 17 million dollars over and above the actual stated book cost value.

We wish to again emphasize that by the use of the index submitted by Dr. Friday we do not here concede that we

[fol. 1236] consider such indices to be useful for any proper purpose in this proceeding. Concerning the use of indices and trends in utility valuation proceedings, it has been said by an eminent authority on this subject, namely, Mr. Wheat, counsel for Panhandle Eastern, referring to the Harvard Law Review, Volume 51, at page 856, that

"If variations between the original cost of utility property, that is, an amount approximating so-called 'prudent investment' and 'the present cost of construction' (mentioned in Smyth vs. Ames, 169 U. S. 466—1898) are to be considered in rate base development, the sensible use of pertinent price and cost indices and trends seems indicated. Such action is believed wholly consistent with the remarks of the United States Supreme Court in West vs. Chesapeake and P. Tel. Co., 295 U. S. 662 (1935), if the trends are carefully selected and bear directly upon the specific type of property under consideration."

Obviously price and cost indices and trends presented in Exhibit 61 by Dr. Friday have not been "carefully selected and do not bear directly upon the specific types of property under consideration", but, if Mr. Wheat deems them to be proper for his purpose in this case, they are certainly entirely proper for our purpose.

We conclude, therefore, in view of the foregoing facts, with the following statements taken from the opinion of [fol. 1237] the Commission in the Chicago District case, and while it is a quotation we adopt it as our position in this case.

"We (and when I here say 'we' I mean the Commission) have been authorized by Congress to determine the actual legitimate cost of utility properties and the depreciation therein, that is, the prudent investment. We have been directed to determine other facts bearing on the fair value of such property, such as reproduction cost, when found necessary for rate-making purposes. There is nothing which makes a determination of reproduction cost necessary for rate making purposes in this proceeding. On the contrary, such a determination would be not only valueless but, in fact, obstructive of the orderly regulatory process. We conclude, therefore, that the rate base in

this case is the actual legitimate cost of the property used and useful in furnishing the service subject to our jurisdiction, less the existing depreciation in such property, plus the working capital necessary to render such service."

. . . . . .

[fol. 1238] Mr. Littman? I believe the reasons already stated by Mr. Gorman are sufficient to warrant the exclusion of the evidence offered in this proceeding of reproduction costs new less depreciation of the consolidated plant, property and business of Panhandle Eastern Pipe Line Company and that of its wholly owned subsidiary, Illinois Natural Gas Company.

There is, however, another further cogent and, I believe, compelling reason why this evidence must be excluded, and that is because this evidence is wholly without any probative weight for rate making purposes and is wholly unreliable for rate making purposes.

As Mr. Gorman has pointed out—and I would like to summarize one portion of his argument, if I may—the reproduction cost estimate, which company witness Biddison presented, amounts to $83,833,448 new and $79,711,698 depreciated. This claimed value new is $17,143,799 in excess of the book cost of the gas plant. Company witness Watkins, the controller of Panhandle Eastern Pipe Line Company, testified that book cost in this case would very closely approximate original cost, and so it may, therefore, be concluded from the company's own testimony that the reproduction cost new estimate, submitted here by Mr. Biddison, exceeds original cost by at least $17,143,000.

[fol. 1239] Now this wide disparity between the value claimed by the company through Mr. Biddison's theoretical and hypothetical estimate and the value or costs appearing on the company's own books and claimed by them as their actual cost is particularly shocking when viewed in the light of the fact that this property was for the most part constructed during an era of high price levels.

The company's estimate, we submit, proves too much and we submit it is distinctly at war with realities.

This so-called reproduction estimate upon closer examination includes the enormous sum of $8,695,524 for so-called market value of gas leaseholds. This estimate is contained in Exhibit 37, Parts I and II, which was presented by company witness Wallace. This estimate of so-called market value of leaseholds of $8,695,000-odd exceeds the claimed book cost of leaseholds, exceeds, if you please, the cost as recorded on the books of this company by the amazing and astounding amount of $7,000,000. In short, the company is here claiming, by its theoretical estimate, approximately five times more for these leases than it actually paid for them.

Now, Mr. Wallace's conclusions are based upon what he pleases to call his judgment. His method, as disclosed by his testimony, we submit, is subject to all the infirmities and vices of the methods employed by the witnesses who [fol. 1240] testified on market value of leaseholds in Dayton Power & Light Company case, which is reported at 292 U. S. 290.

Justice Cardozo in that case condemned in no uncertain terms this character of evidence of market value. He said that such "evidence is lacking in that high coercive power", "is lacking in that high coercive power", and that Court and Commission are "free in their discretion to reject as unsatisfactory the conflicting opinions of a group of friendly experts."

While it is true in this case we have one friendly expert, we submit that the evidence that he submitted is so similar to that submitted by the witnesses in the Dayton case that it, too, must be excluded. Similar evidence was rejected by the United States Supreme Court in United Fuel Gas Company versus West Virginia Public Service Commission, reported at 278 U. S. page 322, the decision in that case being written by Justice Stone.

If I may, for a moment, refer to the exhibit, itself, I would like to read, Your Honor, a bit of the testimony, some of the reasons why Mr. Wallace found a value $7,000,000 in excess of book cost; this is typical. I quote from page 8 of Exhibit 37, Part I.

"From the beginning of active development of the oil pools in the Texas Panhandle field in the year 1926 there

was an excessive waste of gas. In the early years, of [fol. 1241] course, there was not an appreciable market for gas for light and fuel, consequently, the gas at that time was of little or no value. Likewise, the market value of leases was very low. It was what was termed a 'wildcat area' and the producing extent or boundaries of the field had not been determined."

In other words, it is clear that what Mr. Wallace has done here is to reflect in his market value something that the consumer, himself, has created. He also says at page 8: "Beginning about 1927 when some of the major gas transmission lines were being planned, the market value of leases in the gas area increased very rapidly."

In other words, what Mr. Wallace has included in his valuation is an increment, a so-called value, brought about by the very presence or existence of this company's main transmission line running into that field, something which the gas consumer, himself, created.

On page 10 he said, "Legislative and Railroad Commission policy has undoubtedly resulted in the creation of higher values for the reason that a purchaser will now feel more confident of recovering a greater proportion of the gas underlying the land than would have been possible under former conditions."

In other words, Mr. Wallace would ask the rate payer to pay a return upon a value which he claims was brought about by reason of conservation measures taken by the [fol. 1242] Legislative and Railroad Commissions of Texas and other states.

Now the reproduction estimate here submitted also includes the huge sum of $6,053,992 for so-called "cost of business development." At least five and a half million dollars of this amount represents past operating expenses, past taxes, and past interest for which the commission has been reimbursed long since through past rates paid by the consumers. This is simply an undisguised attempt, we submit, to capitalize operating expenses and bond interest.

Now, the United States Supreme Court has again and again rejected similar attempts to compel the rate payers to pay a return on operating expenses long since paid for

through the medium of past rates. As Justice Cardozo pointed out in the Columbus case, 292 U. S. 398, "So far as such expenses had been actually incurred by any affiliated company, they had already been concluded as part of the cost of operations," and that "We cannot find that the Commission and Court went beyond the bounds of legitimate discretion in putting aside these estimates as too uncertain to be followed."

The company's estimate, also, includes the further sum of $1,585,914 for so-called "Value of Gas Purchase Contracts." Now, I submit that this is a monstrous claim. The company here alleges that it has certain advantageous gas purchase contracts under which it buys gas at about [fol. 1243] three and a half cents per m. c. f. It contends that simply because the present market value of that gas which, of course, the consumer, himself, has created, a market which the consumer, himself, I submit has created is four and one-half cents, that he is entitled to capitalize the purported enhancement of value on that account.

Isn't the rate payer entitled to the savings in operating expenses? Can we imagine this company offering to reduce its rates and its rate base if those contracts obligated it to pay more than the going field price of gas purchased?

Indeed not! In those circumstances, of course, the company would contend that the contract price furnishes the correct measure of its cost. Surely the rate-paying public is not to be penalized by the fact that the company has advantageous gas purchase contracts.

Moreover, the fallacy of the contention is apparent because it is the regulated price to the consumer which determines the field price of the gas purchased, and those rates, themselves, are here the subject of inquiry by this Commission.

The market value of gas in the field will in the ultimate be determined by rates fixed by regulatory bodies, including the Federal Power Commission.

If the company's contention in this regard were allowed we would find ourselves in a vicious circle. Moreover, it [fol. 1244] should be remembered that the customer, himself, has created the very market upon which the company

relies as the basis of market value of gas. Indeed, Mr. Biddison, himself, described his estimate of value of gas purchase contracts as "present value of future profits."

This reproduction estimate also includes the amount of almost one-half a million dollars for so-called "Intangible Fixed Capital." This amount covers the alleged cost, as estimated by Mr. Biddison of "Preliminary and Organization Expense." It was computed by Mr. Biddison by applying .75 percent to his total direct construction costs.

Now, it is significant to note that Panhandle Eastern Pipe Line Company claims to have actually expended, according to its own books, $179,339 as compared with Mr. Biddison's estimate of almost a half million dollars on account of intangible plant.

[fol. 1245] Mr. Littman: My argument goes to the weight to the extent that I am endeavoring to show that this evidence is entitled to no weight; that it is wholly incompetent and wholly without any probative weight.

Witness the fact, if Your Honor please, that Mr. Biddison's so-called estimate of a half million dollars for intangible plant is almost three times the claimed actual cost of organizing this company. His claim in this regard appears even more ludicrous when it is considered that Mr. Biddison's estimate of the cost of organizing this company became a different amount after he corrected [fol. 1246] for his error of one and a half million dollars in the estimate of the value of the physical plant.

By using a percentage to the various estimates of physical plant before and after his correction of his million and a half dollar error he secured a lower amount or different amount as a cost of organizing the company.

In other words, the higher Mr. Biddison's estimate of the cost of pipe, then the higher was his estimate for the cost of organizing the company. Certainly such evidence is entitled to no credence or belief.

The items which I have mentioned, and I shall not go into all of them, of course, more than account for the disparity between the company's claimed book cost and

their claimed reproduction cost, but to all this is added the inherent infirmities and vagaries of Mr. Biddison's estimate of reproducing other features of the plant.

Mr. Biddison based his costs, for example, upon prices as of June 30, 1941 which we all know is a most abnormal and unprecedented period. The record shows that it would be impossible to obtain the required quantity of pipe on this date due to the unprecedented war requirements and priorities. But that didn't disturb Mr. Biddison one bit. He assumed that it would all be bought at the top price, notwithstanding the fact that the evidence in this case conclusively shows that the company hasn't [fol. 1247] been able to buy enough pipe to extend their lines for a short distance up in Michigan,—purely a hypothetical estimate based upon anything but the facts,—nor does Mr. Biddison for a moment hesitate to suggest by his estimate that the consumer should pay a return on an alleged increment created by this Nation's defense efforts,—a claimed enhancement of value which the company has neither created nor earned.

It is respectfully submitted under the decisions cited to Your Honor by Mr. Gorman and myself, and under the evidence of the record in this case, that these exhibits should be excluded from the evidence and that all testimony given in connection with reproduction cost new less depreciation should be excluded and we respectfully and earnestly urge the exclusion of such evidence, if Your Honor please.

[fol. 1250] Proceedings.

Trial Examiner: The hearing will be in order.

Upon receipt of the report of yesterday's proceedings which the Trial Examiner carefully reviewed, the session for today seems to be quite appropriate in order to further discuss this objection. I think, in fact, it is very fortunate that the objections were raised at this early stage in the proceedings in order that if any saving of time results, we will be able to plan accordingly.

With respect to the objection stated last evening by counsel for the Commission, we have, of course, the recent

statement of the Commission, itself, in its opinion in the Chicago District Electric Generating proceeding, to the effect that in a so-called "normal" case, as distinguished from what might be called a rare, or unusual case, reproduction cost estimates are neither relevant, material, nor of any probative value.

As the Trial Examiner understands the objection of Commission's counsel, it is in substance this:

That the instant proceeding by reason of the very close parallelism of the facts in this case to those which existed in the Chicago District Electric Generating proceeding fits closely into the category described by the Commission as a "normal" case, and consequently that in this proceeding, reproduction cost evidence is irrelevant, immaterial, of no probative value, and therefore should be excluded in its [fol. 1251] entirety.

That is a correct statement, is it not, Mr. Gorman?

Mr. Gorman: Yes, it is, Mr. Examiner.

Trial Examiner: The Trial Examiner desires to state that he has the very definite impression at this point that there is a close parallel between at least the major aspects of this proceeding and the major aspects of the Chicago District Electric Generating matter.

Consequently, at this moment, the Trial Examiner feels inclined to go along with Commission's counsel in putting this instant proceeding in the category of the so-called "normal" proceeding.

The Trial Examiner does not readily find, from an examination of the evidence, without specific reference to the details, that counsel for the company has come forward with any facts indicating the necessity for a consideration of reproduction cost evidence in this proceeding.

In view of this, I would be pleased, at this point, to hear a statement from company counsel, as to the reasons why they believe that this proceeding necessitates the reception of reproduction cost evidence.

In other words, to obtain a statement in the record as to what peculiar facts are present in this matter which

would take it out of the category of what the Commission in the Chicago case and its opinion, described as a "normal" proceeding.

. . . . . .

[fol. 1259] Mr. Littman: Am I correct in stating that this so called "cost of business development" which figure was derived by Mr. Biddison from Mr. Morton's Exhibit 38, isn't that item a part and parcel of Mr. Biddison's claimed reproduction cost new less depreciation?

Mr. Wheat: Yes, it is.

Mr. Littman: All right.

. . . . . .

[fol. 1277] Mr. Littman: If Your Honor please, I waited patiently throughout the reading by Mr. Wheat of his prepared argument, and nowhere did I hear him answer [fol. 1278] the inquiry propounded of him by Your Honor; namely, is this, or is this not a "normal rate proceeding" such as the proceeding which was before the Commission in the Chicago District Electric Generating case? If this is a normal proceeding, then, of course, if we are to follow the precedent established by this Commission in the Chicago District Electric Generating case, no testimony with respect to reproduction cost new less depreciation is admissible.

If counsel for Panhandle Eastern Pipe Line Company will come forward here and show us that this is not a normal case upon this record, and that it is one of those rate cases referred to by the Commission in the Chicago District Electric Generating case, then, of course, it will be up to Your Honor to consider whether or not evidence of this nature is admissible.

But I think it is highly significant that counsel for the Company has utterly failed to advance one argument thus far along the lines suggested by your Honor in connection with whether or not this is a "normal rate proceeding."

Now, the Commission has fully considered, and said in its opinion in the Chicago District Electric Generating

case, it had fully considered all of the general arguments advanced by counsel for the Company in connection with Smyth versus Ames, and in connection with the legislative history of the section of the Natural Gas Act upon which the Commission relied. All of that is, so far as this Commission is concerned, water over the dam.

The question, of course, will ultimately have to be de- [fol. 1279] cided by the Courts, but I don't believe that it is necessary at this time, inasmuch as the Commission has already fully discussed these legal propositions in its decision in the Chicago District Electric Generating case, to go into them any further here.

I would like to call your Honor's attention, your careful attention, to the wording of our objection. Commission's counsel's objection is, of course, first, to the five-named exhibits; namely, Exhibits Nos. 37, 38, 39, 39-A, and 62, and also Commission's counsel moved "to strike all the testimony concerning reproduction cost given in connection with these exhibits."

Now, careful consideration of the language in that objection would not exclude from the testimony in this case any testimony that might bear upon depreciation accrued —accrued depreciation, which might be applicable to book costs, or to original costs.

It goes to the depreciation which has here been applied to the reproduction cost new.

Now, Exhibit No. 62, set forth three columns in dollars, not in percentages, giving us the reproduction cost new, giving up the accrued depreciation in dollars, and the reproduction cost new less depreciation, referred to by Mr. Biddison as present value, also in dollars.

Of course, we don't know whether Mr. Biddison, nor has he stated on this record, would apply his rates, or percentage of accrued depreciation to original cost or book [fol. 1280] cost, and so our objection, if your Honor please, goes to his resulted dollars, and certainly if Mr. Biddison wishes to come forward in the hearings which will ensue in this case, and testify with respect to the depreciation which, in his opinion, is properly applicable to original cost, or to book cost, we will then, at that time, determine

whether or not in our opinion objection should be made to it.

At this time, however, our objection goes purely to the depreciation in dollars found by Mr. Biddison to be applicable to his reproduction cost new estimates, and I hope that I have made that clear.

Just one further point that I feel might require a little discussion and that is with respect to the alleged cost of business development which is now rather belatedly referred to as "going concern value." I would like to call your Honor's attention to the fact that Mr. Wheat has stated, and I think certainly correctly so, that this estimate of cost of business development is a part and parcel of reproduction cost new less depreciation. It is all interwoven with Mr. Biddison's estimate of the physical plant, and it is all a part of reproduction cost, and, therefore, if we are to follow the Commission's decision in the Chicago District Electric Generating case, we must, of course, exclude it, we believe, in this case.

Now, Mr. Wheat has cited the Circuit Court of Appeals' decision in the Natural Gas Pipe Line Company case with [fol. 1281] respect to going concern value. He has not, however, shown any similarity of facts as between that case and this. Moreover, the United States Supreme Court, itself, has spoken several times on this subject of going concern value, particularly in the Columbus and Dayton cases, wherein the United States Supreme Court stated that under the facts in those cases, no separate allowance for going concern value should be made.

We believe it to be the law that no separate allowance for going concern value need be made in this case. We respectfully submit that our objection to the five exhibits already named, and "to strike all testimony concerning reproduction cost given in connection with these exhibits" should be sustained.

* * * * * * * * *

[fol. 1284] Trial Examiner: With reference to the objection, in so far as it relates to your proposed Exhibit No. 38, there will be no harm whatever in deferring a ruling un-
[fol. 1285] til some later time, when the objection may be

renewed. I think we are in entire agreement, that the subject of depreciation is one thing, you are entitled to introduce evidence concerning, and it is the understanding of the Trial Examiner that this objection is not aimed in any way at the usual evidence concerning depreciation, but only because in so far as any evidence concerning depreciation has been offered by the Respondent, the defendant, at this time, it is in a sense intertwined with the reproduction cost evidence.

Reverting now to the objection in so far as it relates to proposed Exhibits 37, Parts 1 and 2; 39, and 39-A, and the proposed Exhibit 62, and to the opinion of the Commission in the Chicago District Electric Generating Company case, quoted by Commission's counsel yesterday at Page 1227, attention is again directed to the phrase from that opinion, which has been emphasized and restated by Commission's counsel, and to some extent discussed by Mr. Wheat; namely, "In the normal case, we were directed, however, only to determine the actual legitimate cost and the depreciation (that is, the prudent investment) of the utility's property."

In the opinion of the Trial Examiner, there has been no distinction made in the record and counsel for the Defendant has not pointed out any peculiar facts present in this proceeding that would take it out of the category of what the Commission in that opinion described as a "normal proceeding."

[fol. 1286] Since I feel that I am bound by this opinion, and since I feel that there has been no distinction made to take the present proceeding out of the category of "normal cases", I feel prepared to rule on this objection at this time.

However, before making any ruling, I will say that if counsel so desires, counsel may so desire, the Trial Examiner will present to the Commission the question of the inclusion or exclusion of the reproduction cost evidence for such action as the Commission may deem appropriate.

* * * * * * * * *

[fol. 1288] Trial Examiner: Will you state what you have in mind for further proof? It was the understand-

ing of the Trial Examiner that with the exception of some minor matter, the testimony had been completed.

Mr. Wheat: I think the understanding of the Trial Examiner was wholly erroneous if that was his understanding.

The testimony is not yet completed in any sense, and it is in no sense minor in character. The testimony to which I have particular reference, will be the testimony of the management of Panhandle Eastern Pipe Line Company, dealing with the history, development, methods of management, and the operation of the company, and it is to that testimony that I have reference in making the suggestion which I have made, and I think it would save everybody's time and energy.

Trial Examiner: Well, that testimony—will that testimony, in any way, change the basic testimony of Mr. Watkins with reference to the financial history of the company?

Mr. Wheat: Why, of course, it will be in no contradiction to the books of the company. That is not what I refer to.

Trial Examiner: Have you in mind some aspect of your further testimony which might affect the historical cost recorded?

Mr. Wheat: No, I have not, sir.

[fol. 1289] Mr. Littman: In the light of that answer, I submit, if your Honor please, that no evidence that Mr. Wheat can offer could, in any manner, impinge upon what has already been established in this record; namely, that the record shows that this is a normal rate proceeding.

Mr. Watkins having testified that the books and records of this company were in such good shape, and that he already knows that the book costs and original costs will very closely approximate each other, I submit to your Honor that the very purpose of making the objection at this time is so that the record may not be unduly encumbered with lengthy cross-examination on these exhibits, and so that time may not be wasted by prolonging the proceedings by reason of the very presence in the record of these exhibits.

Trial Examiner: As indicated a moment ago, the Trial Examiner is prepared to make a ruling at this time unless there is a preference on the part of counsel for the defendant that the matter be submitted to the Commission.

Mr. Wheat: I should think your Honor should wish to submit this particular matter to the Commission. I, of course, wouldn't suggest that you do so, because that is a matter for your own determination, but I do feel that this is a vital matter, and it is an important matter, and it has been my experience before this Commission that this matter and matters of this sort, rulings are frequently with-[fol. 1290] held until after the Examiner has had an opportunity to discuss the problem with the Commissioners. That is my only thought in this matter, and I am sure that the Examiner must, of course, use his own judgment in respect to this item.

Trial Examiner: Does counsel have any remarks to make?

Mr. Gorman: I have none.

Mr. Wheat: I would like to suggest and request that the Examiner obtain a ruling on this matter from the Commission. I believe that would be a fair method of procedure, and therefore, in reply to the Examiner's suggestion, I make that request.

Trial Examiner: Very well, we will act in accordance with that indicated procedure.

Is there anything else before recess until the 27th?

Mr. Lee: On behalf of the petitioner City of Detroit, I should like to do this, if it is permissible—adopt the motion of counsel for the Commission as being concurred in by the petitioner in this case. Whether or not that is necessary, or whether or not that is of any strategic support to the motion, I am not clear, but if it is, on behalf of the petitioner, and the City of Detroit, and the County of Wayne, as represented by Mr. Goodman, with whom I have conferred, but who unfortunately cannot be here this morning, we should like to join in adopting the motion of the Commission's counsel and to exclude the exhibits referred to, and to strike the testimony presented and predicated thereon.

[fol. 1291] Mr. Wheat: Now, as I understand it, that was not the motion of Commission's counsel just stated:

Mr. Littman: I take it, Mr. Lee, you mean you wish, do you not, to join in the motion made by Commission's counsel?

Mr. Lee: That is correct.

* * * * * * * *

[fol. 1305] C. H. Hinton a witness, having been previously sworn, resumed the stand, was examined and testified further as follows:

By Mr. Culton:

* * * * * * * *

[fol. 1306] Q. Mr. Hinton, in your testimony, you have estimates as to costs of various construction which you expect to have in the future, and some question was raised as to your ability to properly estimate those costs.

I will ask you how long you have been connected with engineering matters? A. Since 1924.

Q. What experience have you had in estimating costs for well construction, gas-well construction in the Hugoton and Panhandle fields?

A. I have been in constant touch with all drilling for the past four years and prior to that time, I made a study of the cost of the probable development required to supply the Detroit market before that line was built.

Q. In that work, have you become familiar with the costs actually incurred by the company in its drilling operations?

A. Yes, sir, at the completion of each well, we naturally get the total cost of that well.

Q. And under whose supervision is that done?

A. That is under my supervision.

Q. Have you, during that period of time, had any experience in estimating the costs of gathering lines and well lines?

A. Yes, since 1929, I have had considerable experience [fol. 1307] on pipe-line estimating work.

I have been on the construction of approximately two thousand miles of pipe line and it was necessary that the engineer make out the monthly estimate for the contractor and, naturally, the engineer must be well informed upon the prices in order to make out the estimate.

Q. Did you do that character of work as engineer?

A. Yes, sir.

Trial Examiner: Just a moment, Mr. Culton. Mr. Hinton's exhibits, I believe, were 42, 43, 44, 45 and 46. Were there any others?

Mr. Culton: That is right, Mr. Examiner.

The questions are related particularly to Exhibits 42 and 43.

Trial Examiner: That is the written testimony and the Schedules?

Mr. Culton: That is right.

Trial Examiner: The other exhibits which were identified by Mr. Hinton were all maps, I believe.

. . . . . .

By Mr. Culton:

Q. Mr. Hinton, are you familiar with the prices which have been paid by the company over the past few years for different types of construction?

[fol. 1308] A. Yes, sir, I am.

Q. How did you obtain that familiarity?

A. From the records of the company.

Q. I believe you testified that in your exhibit you used the drilling-cost unit which was used by Mr. Biddison? A. Yes.

Q. How does that cost compare with the prices which have been paid by the company over a period of several months or years?

A. That price is based upon what has been paid by the company for several years, with the exception of the liner installation in the Hugoton field.

We have not used liners in our Hugoton wells and that cost was estimated by me because I know about how many days it is going to take to make the liner installation. I know the price of the material required.

Q. You know that from your own experience?

A. Yes, sir.

Q. You also made some estimates as to the cost of measuring stations. What do you personally know as to the cost of measuring stations?

A. I have been on enough measuring stations that I know the cost used was just about what I would use, but I further checked that by going back to the company records.

Q. And you find that they are in accord, the prices you [fol. 1309] used?

A. Slightly lower than this price, but due to the increase of the going price of valves, that was raised.

Q. What basis did you use for the unit cost for well lines? A. In that—

Q. (Interposing) In your exhibit.

A. I used the figures that were worked up by Mr. Biddison in that.

Q. Have you, since that time, checked those figures with respect to the company records? A. Yes, I have.

Q. And how do you find the figures compare with the company's experience?

A. Well, I find that there is some fluctuation in the prices. Now, the labor price on the 4½ inch there on the longer lines which have been laid during the past three years, the labor price is slightly lower than the price we used, that is, Mr. Biddison's price, but on the short lines, that is, lines less than one mile in length, why, the majority of them have run considerably in excess of the figure which Mr. Biddison used.

Q. Can you give us an idea, on a percentage basis, as to how those increases or decreases are?

A. Totalling up the number of wells that have been [fol. 1310] built the past three years, taking those direct from the company records, I find that the deviation is less than five percent.

Mr. Littman: Did you mean wells or well lines?

The Witness: Well lines.

By Mr. Culton:

Q. What can you say as to the expense of constructing the gathering lines as distinguished from the well lines? What basis did you use on those lines?

A. In this exhibit, I used all of the figures which were worked up by Mr. Biddison.

Q. Since you testified, have you checked the company records as to past costs on those lines?

A. I have.

Q. How do those costs compare with the figures used by Mr. Biddison?

A. They show slightly under Mr. Biddison's figures, but the price of pipe has changed. I used the pipe price that actually was on the books for my comparison and the increase in the cost of material will make it up. The labor figure is approximately the same.

Q. In other words, the present increased price of material will offset any difference there is between the price on the books and the price used by Mr. Biddison?

A. I do not believe the present price would. I think it [fol. 1311] would probably raise it some, but the price that I used as of June 30 would about equal it.

Q. You testified with respect to the construction of dwellings for employees. What basis did you use for determining that cost when you were preparing your exhibit?

A. Well, I am fairly familiar with building costs, and I used some of the information that was on the company's books and I used my judgment on the other portion of it.

Since that time, I have gone back and checked the cost of the houses built in the producing area of our company, and have found that the cost was, I believe, slightly under $5,800, covering everything that is charged to the house, but we had some exceptionally low bids on the houses for that year.

I have made up a detailed estimate of the cost of those buildings and find that it runs $165 more than the $6,000 which I had in there.

I might add that I used for that purpose a contract price which was submitted for the house itself. The other costs were in about the same proportion as shows on our books for the same type of construction.

Q. You allowed for the construction of a hotel, I believe. How did you arrive at the price for that hotel?

A. That was a little bit difficult, because we want to build that hotel in such a manner that, in the future, we might want to make two dwellings from it, so we are build-
[fol. 1312] ing two five-room dwellings and building a connecting room which will be used for a kitchen and for a passageway, and I estimated that portion of it myself.

Q. And obtained the information from the five-room dwellings from the records on other houses?

A. I checked it from the records, yes.

Q. There was some testimony with respect to the construction of jetties in the Cimarron River. How did you arrive at an estimate of the price for those jetties?

A. That was a contract price, that is, in the form of a contract now and it is $6,478 without any company cost charged to that job. I used $6,500.

Q. There is also an estimate by you as to the expense of a river crossing across the Cimarron River from the loop line. How did you arrive at that cost?

A. I obtained a bid from a contractor, and then just added the price of the material and labor based on past river jobs.

Q. There was a telephone line serving Optima. How did you arrive at the cost of that?

A. By taking the cost of the material required, and I used about 25 percent of the material price for labor, by just counting up to myself what the man-hour requirements would be.

Q. Using your judgment as to the labor time required?

A. Yes, sir, I have been on several hundred miles of telephone construction.

[fol. 1313] Q. There was some testimony by you with respect to power at different points in Texas and Kansas and, probably, also Oklahoma. How did you arrive at the cost of the compression required?

A. The costs on the compressor stations are based on book costs for the miscellaneous work and the power or equipment itself is based on the last quoted price.

Q. By book costs, you mean costs of former construction of similar type?

A. That is right, previous costs.

Q. I believe you state that all of the installing of liners and tubing and acidizing is under your general supervision,

and you keep in constant touch with the cost of those operations? A. That is right.

Q. Have you had anything to do with the preparation of budgets for the company?

A. Yes, sir. That is what I have been working on for the past two weeks.

Q. How long have you been assisting in the preparation of annual budgets?

A. For the past several years.

Q. In doing that work, is it necessary for you to become familiar with the costs of construction of different [fol. 1314] types in the field end of the system?

A. It naturally would be, or we could not make a budget.

Q. That includes the drilling of wells and the construction of lines, and things of that character?

A. That is right, because we weigh different methods of improving our field system and, naturally, we must be familiar with costs in order to decide whether we should build one line and drill a certain number of wells in one portion, or maybe cut down the expenditure by moving that over to another part of the system which fits the line design in a better manner.

* * * * * * * * *

[fol. 1316] Mr. Quitong: Mr. Examiner, I told counsel for the Commission the last time—it was not on the record—Mr. Wallace had discovered that, through error on his part, he had overlooked the circumstance that a number of leases in the Hugoton field were only owned to the extent [fol. 1317] of a half interest by Panhandle Eastern.

He has prepared, and we have printed it, a list of corrected sheets for each of those leases, and a corrected total, which reduces his valuation, I think, approximately $250,000.

Now, we do not have Mr. Wallace here, but I think, with the explanation, probably he would not be required to be here. I will explain that the sheets which had been prepared for him showed Panhandle Eastern Pipe Line Company, et al, and it did not register with him that Panhandle Eastern did not own the entire leasehold interest.

The change is to show, at the bottom of each page, the market value of an undivided one-half interest, and to furnish corrected summary sheets.

Trial Examiner: That will effect a correction of proposed Exhibit 37?

Mr. Culton: Yes, and we ask that that be marked Exhibit 37-A, if we may. We have copies to distribute.

Trial Examiner: That is the correction sheets which you now propose to offer?

Mr. Culton: Yes, sir.

Trial Examiner: As Exhibit 37-A?

Mr. Culton: Yes.

Trial Examiner: They may be so marked.

[fol. 1318] Mr. Littman: May I also inquire whether or not the corrections contained in Exhibit 37-A will not also affect the figures in Biddison's Exhibit 39?

Mr. Culton: They will, to the same extent.

Mr. Littman: In other words, this correction contained in Exhibit 37-A can be very quickly applied to Exhibit 39-A?

Mr. Culton: Yes.

[fol. 1319] Trial Examiner: I assume, Mr. Culton, from a hasty examination of your Exhibit 37-A, there is no matter contained in it which would, in any way, be necessary to ascertain the actual original cost of the properties of your company?

Mr. Culton: There is not. They do not purport to reflect original cost, Mr. Examiner.

Trial Examiner: They are entirely related to the reappraisal of present value?

Mr. Culton: That is right.

The Examiner: Of leases?

Mr. Culton: That is right.

Mr. Littman: I would like the record to show an objection to Exhibit 37-A for the reason that it is a part of, and relates, to the reproduction cost estimate.

Mr. Culton: We may stipulate that the same objections to Exhibit 37 may apply to Exhibit 37-A.

Mr. Littman: Yes.

* * * * * * *

[fol. 1408] P. McDonald Biddison, a witness, having been previously sworn, resumed the stand, was examined and testified as follows:

By Mr. Wheat:

* * * * * * *

[fol. 1410] Q. While we are on this type of matter, have you consulted Mr. Wallace as to the corrections made by Mr. Wallace to his Exhibit 37 which were introduced yesterday morning as Exhibit 37-A? A. Yes, I have.

Q. Will you state what changes, if any, such changes by Mr. Wallace would make in any of your former testimony?

A. The change in values of leases by Mr. Wallace, as I have determined it by a subtraction process, is $355,801.38.

Q. Which figures are you using now to arrive at that subtrahend?

A. I am using the figure of $8,695,524 as the value of [fol. 1411] leaseholds originally derived by Mr. Wallace and as used by me in Exhibits 39 and 39-A.

I am reading the figure from Exhibit 39-A, Line 3, Column B. The new figure which has been submitted in correction sheets—

Q. (Interposing) Exhibit 37-A, are you referring to?

A. I think it has been marked Exhibit 37-A for identification, is $8,339,722.62.

Now, in connection with that correction, if I were to run that through in detail by the same process of correction which I used in Exhibit No. 39, I would feel that it would

be proper at that same time to put through some other corrections.

Q. What are they?

A. One of those other corrections is the matter of prices on main compressor units and auxiliary engines with regard to which I have previously testified.

I testified in regard to the increase in the price on Cooper-Bessemer 1300 horsepower units, and I testified to the increase in price also on Ingersoll-Rand vertical units. The price increases on those main compressor units amounts to about $48,634.08, engines of that general style, and applying the rate of increase to the twenty-three 1000 horsepower units and forty-two 1300 horsepower units in the system, that amounts to $523,800, so those price increases account for $572,434.

In connection with the price of pipe, there is another matter that should be given some consideration in this [fol. 1412] connection. Panhandle Eastern Pipe Line Company has just recently, within the last week, actually placed an order for about 46,000 tons, as I recall it, of seamless pipe, 18-inch to 24-inch.

Q. May I ask, Mr. Biddison, aren't you in error, isn't it 12-inch to 24-inch?

A. Yes, it does cover sizes down to 12-inch.

Mr. Littman: Just a moment, please.

I would like to enter an objection to this testimony, first, for the reasons already stated. The Commission's staff objects to any and all testimony with respect to reproduction costs and I take it that your Honor will allow an objection to all of this testimony without the necessity of interrupting from time to time.

Mr. Wheat: We will stipulate that your objection goes to any items of that sort.

Mr. Littman: I have also a further objection to this testimony, and that is this: If this witness is testifying that his original estimate of reproduction costs as of June 30, 1941, is in error and that he is now aware, for the first time, of errors that appear in that estimate, then we have one situation but, if this witness is now going to

testify to increases, alleged increases in prices that have taken place since June 30, 1941, of course those would not affect his estimate as of June 30, 1941.

I am not clear, and perhaps Mr. Wheat could clear me up [fol. 1413] on it, as to whether this witness is now testifying that his original exhibit of reproduction cost, I believe it is Exhibit 39 and Exhibit 39-A, is now being corrected for certain errors, whether certain changes are now being made because of this witness' mistakes in his estimate as of June 30, 1941, or whether he is now testifying to increases in prices that have taken place since that time?

I would like to have made clear the purpose of this testimony.

Mr. Culton: I think if you will just wait, you will withdraw that particular objection.

The only thing the witness is going to do is to show an unusually advantageous contract which this company has entered into recently. Bearing in mind this is a general investigation by the Commission, I think the information will probably be of interest to the Commission.

Mr. Wheat: And I am sure it will be of interest to counsel if he will hold off a moment.

Mr. Littman: I take it we have a general objection to all testimony on reproduction costs, have we not?

Trial Examiner: That was covered by the statement of Mr. Wheat that counsel agrees that all testimony with reference to proposed Exhibits 39 and 39-A shall come in, if at all, subject to the objection now pending.

Mr. Littman: Well, I want to reserve my right to have [fol. 1414] this testimony stricken.

Trial Examiner: You made your record. Proceed.

By Mr. Wheat:

Q. Go ahead, Mr. Biddison. You were discussing the pipe matter.

A. There is, in the system of Panhandle Eastern Pipe Line Company, a considerable amount of seamless pipe. In the valuation, Exhibit No. 39, there are $7,318,856.27 worth of seamless pipe, 18-inch and larger.

That figure may be subject to slight revision. It was taken off last night, and the additions are by longhand and there might be some slight error, but that is substantially the amount of values for pipe that is in the valuation; that is, the 18-inch and larger seamless pipe.

The price at which that pipe is priced in the valuation is $65 per ton, except for the 18-inch, which is priced at $67.50 per ton, those prices being net f. o. b. mill. The recent purchase was—

Q. (Interposing) When?

A. Within the last week, by Panhandle Eastern, was at $64 per ton average for their immediate pipe requirements, 12-inch to 24-inch, inclusive.

Q. You have not a separate price for each size, have you?

A. No, I do not have and Panhandle Eastern does not have. The price given is an over-all price for the specified tonnage.

[fol. 1413] Q. Proceed.

A. That purchase indicates that the price used by me on seamless pipe is a little bit high, substantially $1.00 per ton. $1.00 per ton out of $64 per ton is 1.56 percent and 1.56 percent on $7,319,000, practically, is approximately $114,000.

Q. Of course, this happened after June 30, 1941, didn't it?

A. That is true, that the purchase was actually closed at that time, but the negotiations had been in progress since prior to June 1.

. . . . . .

Yes, sir, and it was only at this late date that the actual price could have been determined by the placing of an order.

Now, considering the situation with regard to pipe, and the situation with regard to compressor engines, and the correction by Mr. Wallace, I stand on the sum total of my figures.

Q. Why?

A. Because there is a tendency to substantially offset, item for item, the increases against the decreases and, in any event, determinations of this sort are not made with exactitude.

As a matter of fact, there are no operations in engineering or science, except the counting of units, which are done [fol. 1416] with exactitude. They are done with varying degrees of precision and the amount of error, one way or the other, resulting from making these three adjustments, would not change the sum total of the estimate sufficiently to justify revision or argument about the difference.

* * * * * * *

[fol. 1422] Q. Now, Mr. Biddison, have you, since the last hearing in this proceeding, prepared a statement entitled, "Panhandle Eastern Pipe Line Company and Subsidiary Companies—Amount of Depreciation on Book Cost of Property as of June 30, 1941"? A. I have.

Q. Is the document which I now show you the document to which you have just referred? A. It is.

[fol. 1423] Q. Was this prepared by you, or under your direction? A. It was.

Q. And does it correctly show what it purports to show, in your opinion? A. It does.

* * * * * * * * *

(The Document Referred To Was Marked Exhibit No. 69 For Identification.)

* * * * * * * *

[fol. 1424] Mr. Littman: Mr. Biddison, coming back again [fol. 1425] to your claimed reproduction cost, there has been some confusion on this record, due to numerous changes and corrections and, for purposes of clarification, I would like to have you, at this time, read into the record the total reproduction cost new, and total reproduction cost new, less depreciation, as of June 30, 1941, which you are claiming is your estimate.

The Witness: The figures called for will be found on Page 1 of Exhibit No. 39-A as to cost of reproduction new, which is, $83,833,448.54. The deduction from that figure for depreciation which has occurred in the property—

Mr. Wheat: (Interposing) That is shown on Exhibit 62, is it not?

The Witness: That is shown in Exhibit No. 62, and will be found on Page 1, in the amount of $4,121,749.80, with a resulting present value shown on that same page of $79,711,698.74.

Mr. Littman: Now, Mr. Biddison, are the figures which you just read the same figures that you testified to several days ago, before the error of Mr. Wallace's estimate of market value of leaseholds was corrected?

The Witness: They are; as I have just explained today that those were the figures which I would stand upon after making adjustment for that matter and the other matters to which I testified.

Mr. Littman: In other words, the estimate today is the same as it was before Mr. Wallace's corrections in the [fol. 1426] amount of $355,752 was made, isn't it?

The Witness: The sum total of the answer is the same as I explained on testimony today.

* * * * * * * *

[fol. 1439 to 1449 inc.] By Mr. Wheat:

* * * * * * * *

Q. All right. Now, Mr. Biddison, will you turn to Exhibit 69 for identification, which I believe you have just identified as having been prepared by you and as [fol. 1450] showing the amount of depreciation referable to the book cost of the property as of June 30, 1941; is that correct? A. That is correct.

* * * * * * * *

Q. Will you please explain what is contained on that exhibit?

A. In column (A) are shown the account numbers for the property classifications as they appeared upon the monthly financial reports of Panhandle Eastern Pipeline Company.

In column (B) the accounts are named.

And in column (C) is shown the amounts as reported for the corresponding classifications of property.

Q. As of June 30, 1941? A. Yes, sir.

Q. Proceed.

A. In column (D) is shown my estimate of the amounts to be deducted from column (C) for depreciation which has occurred in the property.

This amount of depreciation which is set out in column (B) for each classification of property is based upon the same knowledge of property and the same observations of property as were used in the compilation of the similar [fol. 1451] deductions for depreciation in Exhibit No. 62.

In my Exhibit 39 and 39-A dealing with reproduction cost, the groupings of property were not in all cases the same as carried on the books and on the monthly operating financial reports.

In order to make application of the information as to the condition of property to the amounts shown in column (C) on Exhibit 69 I have used Exhibit 62 to weigh out the deductions there shown to determine the percentages produced by such weighing to apply to column (C) on Exhibit 69, and in that manner have arrived at the amounts in column (D).

The amounts in column (E) are arrived at by deducting the amounts shown in column (D) from the amount shown in column (C), and column (E) represents the book figures on property which I understand to be cost less the depreciation stated in column (D).

Q. In that connection, is there any further explanation which you think would be proper at this time with respect to the items or any of them on Exhibit 69, in order that they may be readily understandable?

A. I think the only thing that would be necessary to explain at all might be some of the weighing out of the data in Exhibit No. 62 to arrive at its application in this case, but that's a purely arithmetical process.

[fol. 1452] The data itself has all been used in the preparation of Exhibit No. 62 and I have testified to that and explained in that connection.

Q. All right. Will you state the amount of accrued depreciation as of June 30, 1941, which you have found from

your examination to exist in the property of Panhandle Eastern Pipeline Company and its subsidiary companies in relation to the cost of the property in question?

A. As shown on page 2 of Exhibit 69, line 31, column (D), the amount is $3,903,102.46.

Q. Thank you. Mr. Biddison, have you also prepared a tabulation starting with the valuation of September 30, 1938, which you stated yesterday you had made with respect to the property of Panhandle Eastern Pipeline Company and which I believe is one of the items which was requested by Mr. Chamberlain, and have you brought that item up to date by the addition of net additions and betterments since that time?

A. I have.

Q. Does the single sheet which I now show you contain a summary of the data which you have used in that connection (handing paper)?

A. It does.

. . . . . .

[fol. 1453] The Document Referred To Was Marked Exhibit 70 For Identification.)

. . . . . .

By Mr. Littman:

Q. Mr. Biddison, calling your attention to Exhibit 69, is the depreciation shown in Column (D) the depreciation arrived at by the methods which you described in connection with Exhibit 62?

A. It is.

Q. That is, generally the observed method, is it not?

A. Generally the observed method, but some of the items were not the result of specific observation. It is the observed method as I explained in my testimony with respect to Exhibit No. 62.

. . . . . .

Q. Mr. Biddison, I want to call your attention to line 8, "Leaseholds." I note that you have no deduction [fol. 1454] for depreciation of the leaseholds. Will you explain why you deducted nothing for depreciation on leaseholds?

A. The explanation with respect to that item in Exhibit 69 is that while some depletion has occurred upon leaseholds I have not considered, in view of the fact that there was no determination of the value, that it was requisite to make a deduction from this book figure of cost for the determination in column (E) of a figure which might be interpreted as value.

Q. Well, the figure for leaseholds shown in column (C) is the book cost of the leaseholds when they were originally acquired?

A. That is true.

Q. And the figure that you show in column (E) entitled "Book Cost Less Depreciation" is precisely the same figure, is it not?

A. Precisely the same figure. I made no deduction in column (D).

The Witness: Column (D) does represent depreciation and I made no deduction in that column for depletion.

. . . . . .

[fol. 1455] By Mr. Wheat:

Q. Mr. Biddison, is it a fact, as stated on line 1 of Biddison Exhibit 70 for identification, that your valuation of total fixed property of this Panhandle Eastern Pipe line Company and its subsidiaries as of September 30, 1938, amounted to $64,544,104.58?

A. It is.

. . . . . .

Q. Mr Biddison, is the document which I now show you a copy of the 1938 study to which you have just referred (handing book)?

A. It is.

Mr. Wheat: May it be marked Biddison Exhibit 71 for identification.

Trial Examiner: It will be so marked.

. . . . . .

[fol. 1456] Q. Mr. Biddison, is the document which has been marked Biddison Exhibit 71 for identification a copy of the document in which appears the figure which I have just read to you?

A. It is.

Mr. Littman: Pardon me.

May I inquire here: Is the document identified as Bidison Exhibit 71 for identification an estimate of the reproduction cost—is this reproduction cost?

Mr. Culton: Yes, as of September 30, 1938.

Mr. Littman: I would like the record to show that counsel for the Commission objects to the entire line of inquiry with respect to this exhibit for reasons already stated in the record.

Mr. Wheat: We will stipulate, Mr. Examiner, that the objection of Commission's counsel, heretofore stated, may go to any questions in connection with this exhibit or these two exhibits which deal with problems of reproduction cost.

You understand, Mr. Littman, that other items not covered by the general blanket of reproduction cost are contained on Exhibit 70 for identification, and I shall question the witness on those and, I take it, that in that instance [fol. 1457] you would prefer to make any additional objections, should you have them, separately for any such items.

Mr. Littman: Yes. Well, my objection goes only to the reproduction cost evidence.

Mr. Wheat: That's what I thought, and, to save time, we will be glad, as I have stated, Mr. Examiner, if it is agreeable, to stipulate to that effect.

Mr. Littman: Is it agreeable to the Examiner for us to stipulate to that effect?

Trial Examiner: Certainly it is perfectly clear from this record that any matter which has come into the record since the objection to the evidence as to reproduction cost was made, accompanied by motions to strike all testimony relating to reproduction cost, heretofore received, shall equally apply to any subsequent additions by way of testimony or exhibits based upon or relating to the reproduction cost new of the property under consideration.

Mr. Littman: Not only reproduction cost—

Trial Examiner: (Continuing) I think the acquiescence of counsel for the defendant has been clear and complete as to each one of these items when objection was raised.

Mr. Littman: Our objection goes, if you Honor please, goes not only to the reproduction cost new but also depreciated.

Mr. Wheat: And of course it is understood, Mr. Litt-
[fol. 1458] man, that if you at any time have any other objection or further objection to any of this testimony, why, we would assume that you will make that as a separate objection.

Mr. Littman: Yes.

Mr. Wheat: Our stipulation of course goes to the objection which you made to the data contained in certain exhibits at the last main hearing of this proceeding.

Mr. Littman: And to future exhibits and future testimony with respect to reproduction cost evidence.

Mr. Wheat: That is correct, yes, just so we understand each other.

Mr. Littman: Yes.

Mr. Wheat: Fine.

By Mr. Wheat:

Q. Mr. Biddison, how did you arrive at and what is the nature of the figure of $64,544,104.58, shown in line 1 of Exhibit 70 for identification, and also shown as the final result of your 1938 valuation on Exhibit 71 for identification?

A. On page 3 of Exhibit 71 for identification, near the bottom of the page, the third line of figures from the bottom, is shown the item of "Total Fixed Property— $64,544,104.58" in the column headed "Reproduction Cost New."

That is the figure appearing on Exhibit 70 for identification at line 1.

[fol. 1459] Embraced in that total in the classification of "Production System Property" on page 2 are "Produc-

tion System Leaseholds" in the amount of $4,592,116.04, and "Gas Wells and Equipment" in the amount of $1,882,830.

As indicated on page 7, and as explained in the letter of transmittal at the front of the report—

Q. Exhibit 71?

A. Yes (Continuing)—the leases and the wells therein were evaluated by Mr. Ralph E. Davis.

Q. Did you accept Mr. Davis' figure?

A. I have used Mr. Davis' figure. I have accepted it and used it.

Mr. Wheat: I may say, Mr. Examiner, we will file that in by Mr. Davis himself, because I think it will be necessary here.

A. (Continuing) His report was dated February 1, 1937.

That report evaluated the leases in Kansas and Oklahoma portions of the Hugoton Field at $2,019,000, and the leases in the Panhandle Field of Texas or Amarillo Field, as indicated on page 8, at $3,061,000.

I have estimated the reproduction cost of wells, which for the Hugoton Field are shown on page 7, it amounted at that time to $541,595, and I evaluated the wells in the Amarillo Field as of that date, as shown on page 8, at [fol. 1460] $556,890.

Since the values placed by Mr. Davis upon the property included the values of wells and leases, I deducted the well values from the total values and assigned the balance to the leases.

I have then in both cases added to the figures so obtained additional leases obtained between the date of the Davis report and the date of the evaluation and have deducted the leases surrendered in the interim, and I have thereby arrived at a division between lease cost, lease value, and well value.

Q. You are now speaking entirely of Exhibit 71 for identification, are you not? A. Yes.

Q. Proceed.

A. The balance of the property has been determined by estimating reproduction cost or by taking book cost in substantially the same manner as I explained for the valuation made in 1941 in Exhibit No. 39.

Certain items which were recently constructed or which were of little importance were taken at their book figures.

The items of transmission mains were estimated upon construction costs determined from an analysis of the contract prices for recent construction.

Q. During 1938? A. During 1936 and 1937 largely. [fol. 1461] Q. I see.

A. The estimate for compression stations was predicated upon an analysis of the contractors' construction reports to Panhandle Eastern Pipeline Company.

The Liberal Gasoline plant was determined in the same manner, and its cost is shown on page 2, I believe, the book cost on that date.

Q. It was practically new then; was it not?

A. It had been constructed in 1936 with an addition in 1937 so if was practically new property.

The items of "General Office Equipment" and "General Garage Equipment" and "General Laboratory Equipment" and "General Tools and Implements" groups under "General System Property" on page 3 are taken from the books.

"General Communication Equipment" was estimated by inventorying a typical mile of various types of construction on the system, pricing out that equipment and applying thereto a labor ratio determined from a study of telephone line construction.

The items of "Intangible Fixed Capital" and of "Undistributed Construction Expenditures" were determined substantially in the same manner as for Exhibit No. 39. The details do not appear in the report.

The item of "Construction Work in Progress," shown [fol. 1462] on page 3, and of "Materials and Supplies", on that same page, are the amounts shown by the books as of the valuation date, September 30, 1938.

Q. Let me ask you, Mr. Biddison: On pages 2 and 3 of Exhibit 71 for identification, you have, do you not, two columns of figures after the various classes of property, one headed "Reproduction Cost New" and the other headed "Present Value"?

A. Yes, sir.

Q. And what do those two columns represent?

A. The column headed "Reproduction Cost New" represents the estimated cost of reproducing the property in new condition as of September 30, 1938.

The column headed "Present Value" represents the residual amount after deducting from reproduction cost new the amounts by which I estimate the various classes of property had lost value at that time.

Q. Through the accruing of depreciation?

A. Through the occurrence of depreciation in property.

Q. Yes. Mr. Biddison, was this report, Biddison Exhibit 71 for identification, prepared by you at the request of Panhandle Eastern Pipeline Company?

A. It was.

Q. And do you believe that it reflects the reproduction cost new of the property as it existed on September [fol. 1463] 30, 1938? A. I do.

Q. Now, will you turn to Biddison Exhibit 70 for identification and state where you obtained the figure of $6,380,886.03, listed in line 4 as "Net Additions to June 30, 1941."?

A. I obtained that figure from the controller, Mr. Leith Watkins.

. . . . . .

Q. Will you now explain what else you have done in connection with Biddison Exhibit 70 for identification and what it shows.

A. In Line 1, the item of "Fixed Property", on Exhibit 70, includes an item of "Construction Work in Progress" of $63,215.38, which I have deducted from the "Total Fixed Property."

I have then added the amount of net additions from September 30, 1938, to June 30, 1941, as furnished to me by Mr. Watkins.

This results in a fotal fixed property on the basis of the 1938 values and "Net Capital Additions as of June 30, 1941," as shown in line 5, Biddison Exhibit 70 for identification, of $70,861,775.23.

[fol. 1464] Q. To that you have added certain items, have you not? What are they?

A. To make this comparable to Exhibit No. 39 I have added working capital in the amount of $1,569,000, shown at line 6, and taken from the same source as the same amount shown in Exhibit 39 and Exhibit 39-A, and I have added the value of gas-purchase contracts derived in the same fashion and from the same source as similar items appearing in Exhibits 39 and 39-A, and I have added "Cost of Business Development" in the amount of $6,053,992.48, derived from the same sources and in the same manner as the identical figure appearing in Exhibits 39 and 39-A, and have arrived at reproduction cost new of the plant property and business existing June 30, 1941, based upon the 1938 values and subsequent capital additions and the addition of the other items just explained, of $80,070,681.71.

. . . . . .

Mr. Littman: I would like to state at this time, if your Honor please, that Commission's counsel has a further objection to Exhibits 70 and 71 for identification for the reasons that they are wholly immaterial to the issues presented in this proceeding.

[fol. 1465] Mr. Culton: Mr. Examiner, so that the record of the defendant may be clear: We are offering that on several grounds:

First, it shows the experience which this witness heretofore had with the properties of this company.

Second, the values called for by one of the interveners in the case.

Third, it is one of the matters referred to in the order relating to the subpoena duces tecum.

The next reason is that it is corroborative of the witness' testimony with respect to the present reproduction cost of the properties.

And, finally, because it is a valuation made at approximately the date the National Gas Act went into effect, in the summer of 1938, and for the purpose of showing the value of the defendant's property as of that date.

. . . . . .

[fol. 1470] LEITH D. WATKINS, a witness, having been previously sworn resumed the stand, was examined, and testified further as follows:

Direct Examination—Resumed.

By Mr. Wheat:

. . . . . .

Q. Mr. Watkins, since the conclusion of the hearing last held in this proceeding, have you prepared a one-page statement headed "Panhandle Eastern Pipeline Company and Subsidiary Companies—Net additions to Gas Plant Per Books from October 1, 1938, to June 1, 1941."

. . . . . .

Is the single sheet which I now show you the statement in question (handing)?

A. It is.

. . . . . .

Trial Examiner: It will be marked for identification as Watkins Exhibit 72.

. . . . . .

[fol. 1471] By Mr. Wheat:

Q. Mr. Watkins, I think you have stated that this document which has been marked Exhibit 72 for identification was prepared under your direction?

A. That is correct.

Q. From the books of the company?

A. That is correct.

Q. And does it in your opinion correctly show what it purports to show?

A. It does.

Q. Now, I note the figure $6,380,886.03 as being the same figure which was testified to by Mr. Biddison this

morning as the net additions to gas plant. Did you furnish that figure to Mr. Biddison at his request?

A. I did, as representing the net additions to gas plant per books from period October 1, 1938, to June 30, 1941.

Q. And would you please describe what is shown on Exhibit 72 for identification.

A. Exhibit No. 72 for identification contains a statement by classifications of property, showing the increase or decrease in the investment per the books of Panhandle Eastern Pipeline Company or its subsidiary companies in those segregated classifications during the period from October 1, 1938, to June 30, 1941.

[fol. 1472] Q. What do the black figures show in column (B)?

A. The black figures in column (B) represents increases, while the red figures shown in the same column represent decreases, in investment during the period.

Q. And the total shown at the bottom of the page, and which I have heretofore read into the record is the net of the black figures over the red figures; is that correct?

A. That is correct.

* * * * * * * *

Q. Mr. Watkins, have you also compiled a document consisting of a number of pages headed "Comparison of Costs of Certain Equipment, Materials and Labor—Panhandle Eastern Pipeline Company and Illinois Natural Gas Company"?

A. Such a document has been prepared under my direction.

Q. Is the document which I now show you the document to which you have just referred (handing)?

A. It is.

[fol. 1473] Q. You say it was prepared under your general supervision?

A. That is correct.

Q. And does it in your opinion correctly show what it purports to show?

A. It does.

* * * * * * * *

Trial Examiner: It will be marked for identification as Exhibit 73.

* * * * * * * *

Exhibit No. 73 for identification contains a comparison of costs of certain equipment and materials and labor used either in construction or operation by Panhandle Eastern Pipeline Company and its subsidiary companies for the period shown in the various charts or tables contained in the document from which the charts were prepared for several classes of such materials or equipment.

. . . . . .

[fol. 1474] A. Chart No. 1 of Exhibit No. 73 is a comparison of the cost of labor man-hours in cents per man-hour for the months of July, 1938, and September, 1941.

. . . . . .

Q. What were the figures?

A. For July, 1938, the cents per man-hour of labor cost was 58 cents and for September, 1941, 82 cents.

Q. Do those figures in your opinion show that it now costs the company more per man-hour of labor than it did in recent periods?

. . . . . .

By Mr. Littman:

Q. Before you leave chart No. 1, Mr. Watkins, I would like to inquire what labor is included in chart No. 1?

A. There is a table for charts No. 1 and No. 2 immediately following chart No. 9, which shows in some substantial detail the labor included in not only chart No. 1 but chart No. 2 as well.

By Mr. Wheat:

Q. In general what is that?

[fol. 1475] A. In general the labor is that of foreman, chart changers and well tenders and laborers in the production system, and foremen, line walkers, welders and laborers in the pipeline section of the transmission department; compression engineers, auxiliary engineers, and oilers in the compression section of the transmission department; meter engineers, meter men in the measurement division of the transmission department; telephone system, linemen; stillmen, boiler men and oilers in the gasoline and dehydration operation.

Q. Under the "telephone system" only the linemen are shown, is that correct? A. That is correct.

Q. Under the "gasoline and dehydration plant" are the stillmen, boiler men and oilers that you mentioned?

A. That is correct.

Q. Will you turn now to chart No. 2 and state what is shown on chart No. 2?

A. The first block to the left in the upper section of chart No. 2 gives a comparison of man-hour labor cost in the production system for the month of July, 1938, with September, 1941.

Q. And those figures are taken, are they, and the heights of the bars represent, do they, items from the table for charts No. 1 and No. 2 under the heading "Pro-
[fol. 1476] duction System"?

A. They do.

Q. In addition to that have you shown the charts of labor costs and labor man-hour costs for transmission pipe lines, transmission compressors, transmission measurement, the telephone system, and the gasoline and dehydration plant?

A. I have on this same chart No. 2.

Q. And all of those items are covered, are they, on the table for charts Nos. 1 and 2? A. They are.

Q. And the totals at the bottom of that table are the totals, are they, which were used in the preparation of chart No. 1?

A. They are.

Mr. Littman: May I inquire, Mr. Watkins?

By Mr. Littman:

Q. Tell me whether or not the amount shown in your total for charts Nos. 1 and 2 are operating expenses, or do they include costs of construction?

A. Principally they are operating expenses. The reason there is no comparison given for construction is because of the varying nature of construction projects during the period.

It is the witness' belief, however, that the same general trend of costs would be in evidence had such charts been prepare .

[fol. 1477] Q. Are you prepared at this time to say whether or not the figures in table for charts Nos. 1 and 2 are all operating expenses or not?

14-A, Securities & Exchange Commission Releases Nos. 2778 and 2834 — Findings and Opinion of the Commission in the Matters of Panhandle Eastern Pipe Line Company, et al	10808	4047

Index, Volume IX.

Order of Securities & Exchange Commission Denying Applications in Part and granting Applications in Part	10842	4087
Supplemental Order of Securities & Exchange Commission amending Findings and Opinion	10844	4089
17, Miscellaneous Data concerning Property and Operations of Panhandle Eastern Pipe Line Company	10848	4090
Schedule 1, Panhandle Eastern Pipe Line Company System Compressor Stations	10848	4090
Schedule 2, List of Communities receiving Service directly or indirectly from Panhandle Company including Population and Number of Customers as of June 30, 1941	10849	4091
Schedule 3, List of Industrial Customers receiving Service direct from Panhandle Company System; June 30, 1941	10853	4099
Schedule 11, Panhandle Eastern System Summary — Miles of Pipe by Sizes, June 30, 1941	10926	4101
30, Testimony of Rufus M. Smith	10958	4103
Schedule 2, Estimated Original Gas Content in the Texas Panhandle Field under Acreage constituting Reserves of Panhandle Eastern Pipe Line Company as of July 1, 1941	10986	4125

	Original	Print
Schedule 3, Estimated Remaining Gas Content in the Texas Panhandle Field under Acreage constituting Reserves of Panhandle Eastern Pipe Line Company as of July 1, 1941	10987	4125
Schedule 5, Comparison of Open Flow Potentials in Texas Panhandle Gas Field	10990	4129
Schedule 6, Gas Acreage owned and under Gas Purchase Contracts held by Panhandle Eastern Pipe Line Company as of June 30, 1941	10991	4131
Schedule 7, Hugoton Production to Argus Natural Gas Company, Inc. by Panhandle Eastern Pipe Line Company, et al	10992	4133
Schedule 8, Texas Production to Panhandle Eastern Pipe Line Company	10993	4135
Schedule 9, Hugoton Production to Panhandle Eastern Pipe Line Company	10997	4143
Schedule 10, Hugoton Production to Panhandle Eastern Pipe Line Company	11000	4149
Schedule 11, Analysis of Cumulative Production to Main Line to and including Fiscal Month of June 1941	11003	4155
Schedule 12, Comparative Statement of Production and Purchases from each District for the two Years ended June 22, 1940 and June 22, 1941	11004	4157
36, Testimony of Glenn G. Bartle	11010	4159
Schedule 3, Estimated Original Gas Content in the Hugoton Field, (Kansas, Oklahoma and North Texas Panhandle), under Acreage constituting Reserves of Panhandle Eastern Pipe Line Company as of July 1, 1941	11038	4176
Schedule 4, Estimated unmetered Gas from Panhandle Eastern Pipe Line Company Wells in the Hugoton Field Kansas, connected to Argus Natural Gas Company, Inc. as of July 1, 1941	11041	4181
37, Testimony and Exhibits, Market Value of Leases of Panhandle Eastern Pipe Line Co.	11047	4187
R. J. Wallace	11045	4187
Summary of Market Value of Leases	11064	4199
38, Basic Statistics used in calculating Interest, ad valorem Taxes and operating Expense attributable to unused Capacity	12159	4203
39, Reproduction Cost New of Plant, Property and Business of Panhandle Eastern Pipe Line Company and subsidiary Companies as of June 30, 1941	12162	4206
Letter P. McDonald, Biddison, Consulting Engineer, to Panhandle Eastern Pipe Line Company, August 29, 1941	12163	4206
Statement relating to Reproduction Cost—New—June 30, 1941	12164	4207
Summary	12165	4207
39-A, Reproduction Cost New of Plant, Property and Business of Panhandle Eastern Pipe Line Company and subsidiary Companies as of June 30, 1941	13130	4208
Letter P. McDonald Biddison, Consulting Engineer, to Panhandle Eastern Pipe Line Company August 29, 1941	13130	4208

	Original	Print
Statement relating to Reproduction Cost New—June 30, 1941	13131	4209
Summary	13133	4209
40, Table showing estimated Main Line Sales, years 1941-1946, inclusive	13149	4211
41, Graph showing Sales and Gas Plant by Years, Panhandle Eastern Pipe Line Company and Subsidiary Companies	13150	4213
42, Testimony of C. H. Hinton relating to Future Capital Expenditures and Operating Expenses in Production and Gathering System West and South of Liberal, Kansas	13151	4215
43, Schedules presented in connection with the written Testimony of C. H. Hinton	13193	4244
Schedule 1, Additional Capital Expenditures required to produce and gather Basic Load, or Present Requirements	13194	4244
Schedule 2, Additional Capital Expenditures required to produce and gather Anticipated Increased Load	13195	4244
Schedule 3, Estimate of Operation and Maintenance Costs west of Liberal Panhandle Field — Basic Load	13196	4245
Schedule 4, Estimate of Operation and Maintenance Costs — west of Liberal Panhandle Field — Estimated Future Load	13199	4251
Schedule 5, Probable Production from Panhandle Eastern's own Wells and Wells under Gas Contracts (Panhandle Field) during the Period July 1, 1940 to December 31, 1956	13202	4257
47, Panhandle Eastern Pipe Line Company and Subsidiary Companies, future Capital Requirements, Gas Transmission Facilities, Liberal Station and Eastward	13206	4257
48, Statement showing Balance Sheets per Books Panhandle Eastern Pipe Line Company and Subsidiary Companies, as at each December 31, 1930 through 1940 and as at June 30, 1941	13207	4259
49, Income Statement per Books — Period from April 1, 1932 to December 31, 1941	13210	4265
50, Statement showing Earned Surplus per Books, Period from Commencement of Operations to June 30, 1941	13212	4269
51, Statement showing Capital Surplus per Books, Period from September 1, 1930 to June 30, 1941	13214	4273
52, Statement showing Investment in Gas Plant as at each December 31, 1930 through 1940 and as at June 30, 1941	13215	4275
53, Statement of Dividends paid on Class A and Class B Preferred Stocks from beginning to September 1, 1941	13217	4279
54, Statement of Dividends paid on Common Stock from beginning to September 1, 1941	13219	4280
55, Statement showing Comparison of Sales and Revenue, Principal Industrial Customers, years 1939, 1940 and 1941	13220	4281
55-A, Statement showing Comparison of Sales and Revenue, Principal Industrial Customers, years 1939, 1940, and 1941	13221	4283
56, Statement of Gas Produced, Period from April 1, 1932 to June 30, 1941	13222	4284
57, Statement of Gas Purchased, Period from April 1, 1932 to June 30, 1941	13223	4285

	Original	Print
58, Statement of Gas Revenue, Period from April 1, 1932 to June 30, 1941 and Schedule showing Detail of Sales to various Types of Customers, 1939 and 1940	13224	4287
Schedule 1, Statement of Gas Revenue, Period from April 1, 1932 to June 30, 1941	13224	4287
Schedule 2, Detail of Sales to Gas Utilities, years 1939 and 1940	13225	4289
Schedule 3, Detail of Sales to Industrial Customers, years 1939 and 1940	13227	4293
59, Statement of Gas Revenue by States, Period from April 1, 1932 to December 31, 1941	13229	4297
60, Statement showing Sales Agreements with other Gas Companies as at June 30, 1941	13230	4299
61, Study of Current and Future Trends in Commodity Prices and Wages, by David Friday	13238	4310
Graph showing Wholesale Prices from 1800 to 1940	13239	4311
Index Numbers of Wholesale Prices of Commodities by Groups	13241	4313
Commodity Price Indexes of Ten Countries	13247	4318
Statement relating to Tax Collections in the United States, from 1913 to 1942	13258	4328
Index Numbers of Wholesale Prices of all Commodities by Months, from 1890 to 1940	13263	4333
Statement relating to Wholesale Prices for Week Ended September 20, 1941	13264	4335
Graph relating to Average Weekly Earnings in Manufacturing Industries of New York State from 1914 to 1941	13266	4339
Graph relating to Average Hourly Earnings and Average Actual Hours per Week per Worker in twenty-five Manufacturing Industries from 1914 to 1941	13267	4341
Graph relating to Average Cost of Living from 1935 to 1939	13268	4343
62, Deduction from Cost of Reproduction New for Depreciation and Present Value of Plant, Property and Business as of June 30, 1941	13270	4345
Letter from P. McDonald Biddison, Consulting Engineer, to Panhandle Eastern Pipe Line Company, September 30, 1941	13271	4345
General Summary	13272	4347
63, Investors' Appraisal of the Risk of Capital in the Natural Gas Industry as compared with other Divisions of the Utility Industry, Summary of Analyses, prepared by Paul B. Coffman, Vice-President of Standard and Poors Corporation	13321	4349
Table of Contents	13322	4349
Statement of Experience and Qualifications of Paul B. Coffman	13327	4354
Investors' Appraisal of Capital Risks in Various Divisions of the Utility Industry	13348	4371
Statement A, Investors' Appraisal of Risks of Capital for the years 1937, 1938, 1939 and 1940	13357	4373

	Original	Print
Statement A-1, Investors' Appraisal of Risks of Capital for the Interim Period of 1941, January-August, Both Inclusive	13352	4375
Statement B, Investors' Appraisal of Risks of Capital for the years 1937, 1938, 1939 and 1940	13353	4377
Statement B-1, Investors' Appraisal of Risks of Capital for the Interim Period of 1941, January-August, Both Inclusive	13354	4379
Statement C, Investors' Appraisal of Risks of Capital for the years 1937, 1938, 1939 and 1940	13355	4381
Statement C-1, Investors' Appraisal of Risks of Capital for the Interim Period of 1941, January-August, Both Inclusive	13356	4383
Statement D, Investors' Appraisal of Risks of Capital for the years 1937, 1938, 1939 and 1940	13357	4385
Statement D-1, Investors' Appraisal of Risks of Capital for the Interim Period of 1941 January-August, Both Inclusive	13358	4387
Statement E, Investors' Appraisal of Risks of Capital for the years 1937, 1938, 1939 and 1940	13359	4389
Statement E-1, Investors' Appraisal of Risks of Capital for the Interim Period of 1941, January-August, Both Inclusive	13360	4391
Statement F, General Information Covering each Company as to the Nature and Size of the Business and the Territory served	13361	4393
64, Statistics supporting Data, Exhibit 63, Appendixes A, B, and C	13379	4414
Appendix A, Complete List of Companies studied and Reasons for eliminating those not used to determine Investors' Appraisal of Risks of Capital	13380	4414
Appendix B, Securities of forty-three Natural Gas Companies considered Representative of the Industry, etc.	13387	4426

Index, Volume X.

Appendix C, Working Papers showing the Computation of Investors' Appraisal of the Risks of Capital	13398	4446
Water Companies	13399	4447
Electric Operating Utility Companies	13420	4461
Manufactured and Mixed Gas Companies	13465	4501
Natural Gas Companies	13495	4521
65, Study relative to Rate of Return on Panhandle Eastern Pipe Line Company prepared by Paul B. Coffman, Vice President, Standard and Roors Corporation	13533	4547
Table of Contents	13534	4547
Chart No. 1, Main Transmission System of Panhandle Eastern Pipe Line Co. and Subsidiary	13542	4559
Chart No. 2, Growth of Natural Gas Industry in United States of America from 1906 to 1940	13548	4567
Chart No. 3, Consumption of Natural Gas in United States of America from 1919 to 1940	13550	4571
Chart No. 4, Revenue from Natural Gas Consumed in United States of America from 1919 to 1940	13552	4573

	Original	Print
Chart No. 5, Average Revenue per M. C. F. from 1929 to 1940	13554	4575
Chart No. 6, Panhandle Sales by States, vs. Industry Consumption of Natural Gas from 1934 to 1940	13556	4577
Chart No. 7, Trends of Gross Revenue from 1934 to 1940, Panhandle vs. other Pipe Line Companies and Industry	13558	4579
Chart No. 8, Operating Ratio of Panhandle Compared with other Pipe Line Companies from 1934 to 1940	13560	4581
Chart No. 9, Trend of Revenue and Expenses of Panhandle Eastern Pipe Line Company from 1934 to 1940	13562	4583
Chart No. 10, Percent Earned on Invested Capital of Panhandle Based upon Capital Structure	13564	4585
Chart No. 11, Percent Earned on Invested Capital of Panhandle Based upon Net Property, Intangibles and Working Capital	13566	4587
Chart No. 12, Return to Common Stockholders of Panhandle Eastern Pipe Line Company from 1934 to 1940	13568	4589
Chart No. 13, New Tax Bill will reduce Income sharply Computations based on Operations — Twelve Months ended June 30, 1941	13570	4591
Chart No. 14, Percent Earned on Invested Capital of Panhandle Eastern Pipe Line Company — as of June 30, 1941	13572	4593
Chart No. 15, Percent Earned on Invested Capital of Panhandle Eastern Pipe Line Company — as of June 30, 1941	13574	4595
Chart No. 16, Historical Costs of Debt Capital of Panhandle Eastern Pipe Line Company — from 1930 to 1941	13576	4599
Chart No. 17, Effect of 1941 Refinancing of Panhandle Eastern Pipe Line Company	13578	4603
Chart No. 18, Historical Costs of Preferred Stock Capital of Panhandle Eastern Pipe Line Company from 1937 to 1941	13580	4605
Chart No. 19, Earnings — Price Ratios of Natural Gas Pipe Line Common Stocks from 1937 to 1940	13582	4607
Chart No. 20, Current Earnings — Price Ratios of Natural Gas Pipe Line Common Stocks	13584	4609
Chart No. 21, Cost of Financing Northern Natural Gas Company Common Stock — Offered to Public on September 10, 1941	13586	4613
Chart No. 22, Estimated Current Cost of Financing Common Stock of Panhandle Eastern Pipe Line Company	13588	4615
Chart No. 23, Continuing Growth of Panhandle System Indicates Future Needs for New Capital	13590	4617
Chart No. 24, Panhandle Eastern Pipe Line Company Invested Capital as of June 30, 1941	13592	4621
Chart No. 25, Preferred Stock Unusual in Natural Gas Pipe Line Companies	13594	4623
Chart No. 26, Earnings Necessary to Maintain Credit Position of Panhandle Eastern Pipe Line Company	13596	4625
Chart No. 27, Earnings Necessary to Maintain Credit Position of Panhandle Eastern Pipe Line Company	13598	4627
Chart No. 28, Overall Cost of Capital to Panhandle Eastern Based on Ideal Capital Structure	13600	4629

	Original	Print

XXX III

A. They are all operating expenses.

Q. For the months shown? A. That is correct.

* * * * * * * * *

By Mr. Wheat:

Q. And do show a general trend upward in each individual item? A. That is correct.

Q. As covered by the tables or by the charts on the pages headed "Chart No. 1" and "Chart No. 2"?

A. That is correct.

Before leaving this, however, I would like to amplify my statement made in response to Mr. Littman's question.

It might have been possible that either in the month of July, 1938, or the month of September, 1941, that some of the employees for which both the man-hours and amounts are shown in the table for chart No. 1 performed some incidental construction work, in which event such cost would have been charged to construction.

In preparing these charts no effort was made to segregate such incidental construction costs from costs properly chargeable to operation.

[fol. 1478] The amounts shown here represent the total received by the payroll classification selected.

Mr. Littman: And you are not prepared, of course, at this time to say how many of these dollars found their way into operating expenses, and how many of them found their way into plant account.

The Witness: I am not.

By Mr. Wheat:

Q. I take it from your testimony, Mr. Watkins, that the vast proportion of the dollars represented on the table for charts Nos. 1 and 2 represent operating expenses?

A. Yes. The very nature of the work performed by the employees selected would indicate that.

* * * * * * * * *

Q. Can you say whether you included here all personal services?

* * * * * * * *

[fol. 1479] A. No, I did not.

Q. What limitations were imposed?

A. The employees selected for this comparison represented the payroll classifications for which there had been at intervals over the period of the last four or five years specific general class raises or changes in payroll rates.

The remainder of our employees' bases of pay did not undergo such general classification.

. . . . . .

[fol. 1480] By Mr. Wheat:

Q. Now, will you turn to chart No. 3, Mr. Watkins, and state what is shown on that chart, and also what is shown on the table for chart No. 3 at the back of Exhibit No. 73 for identification.

A. Chart No. 3 is a comparison of the cost of seamless steel pipe for 24-inch pipe represented by the first block in the chart, which shows the cost per ton, in dollars, for purchases made during the year 1940 and for the year 1941.

The respective amounts are $44.59 per ton and $64 per ton for the 24-inch pipe.

Q. The same figures appear for the 20-inch pipe, do they not? A. They do.

Q. There is a slight difference, isn't there, with respect to the 18-inch pipe?

. . . . . .

A. In the case of the 18-inch pipe the cost for purchases, cost per ton of purchases for the year 1939 was $45.08, while the cost per ton for purchases made during the year 1941 remained at $64.

These prices are mill prices.

Q. And where were they obtained?

[fol. 1481] A. They are shown by the table for chart No. 3.

The source of the information for the year 1940 was from the company's gas plant record.

For the year 1941 from the company's Purchasing Department and representing the purchases consummated on October 22nd, 1941.

Q. Just last week? A. That is correct.

Q. I note you use the figure $64 per ton for all three of these sizes. Is it a fact that in making the order last week that you mentioned the company received no separate quotation on individual sizes?

A. That is a fact.

Q. Was the $64, then, a price averaged over these various sizes?

A. That is correct with respect to these particular sizes and other sizes of pipe purchased at the same time.

Q. What sizes did this price cover?

A. It covered sizes ranging from 24 inches down to 12.

Q. That is the price, is it, which this company is now preparing to pay under this pending order for the pipe in question?

A. It is.

. . . . . .

[fol. 1482] By Mr. Littman:

Q. Mr. Watkins, when does the company expect to receive the deliveries of this pipe which you have shown on table 4, chart No. 3, for the year 1941?

A. It is the witness' information that deliveries for this pipe are to begin about the middle of November, this year.

Mr. Wheat: 1941?

The Witness: Yes, and to continue at regular intervals thereafter until the entire purchases have been delivered.

By Mr. Littman:

Q. Does this price include all of the discounts?

A. This is a net price at the mill.

Mr. Littman: Thank you.

Q. That price would not include the cash discount, would it?

A. It was furnished to the witness as the net price at the mill and the question of cash discount was not discussed except in a very general way, as a result of which the witness assumed there would be no cash discount.

Q. But you are not certain about that right at this time, are you? A. I am not.

[fol. 1483] By Mr. Wheat:

Q. Now, will you turn to chart No. 4 and to the table for chart No. 4, and state what is shown on those two pages of Exhibit 73.

A. Chart No. 4 gives a comparison of the cost of pipe couplings and valves for the sizes and periods shown in the two blocks in chart No. 4 and the information from which the charts were prepared is contained in the table for chart No. 4.

The first section of chart No. 4 compares the cost of 24-inch O. D. couplings purchased in 1939 and those purchased during the year 1941.

The respective costs were $8.75 per coupling in 1939 and $10.04 per coupling in 1941.

Both of these prices refer to the 24-inch O. D. couplings, the 24-inch O. D. sizes.

Q. What about the valves 24 by 20?

A. The 24 by 20 valves purchased during the year 1939 cost $600 each while those purchased during the year 1941 cost $690.

Q. As shown on the table for chart No. 4?

A. That is correct.

The information there was taken, in the lower section, from the company's gas plant records, while the data with respect to the 24-inch couplings came both from its [fol. 1484] plant records and from recent purchase records.

. . . . . .

Chart No. 5 is a comparison of the cost of river clamps, stated in cost per ton.

The cost of river clamps purchased in 1940 was $48.55, while those purchased in 1941 cost $55.

. . . . . .

Mr. Littman: May I inquire: Is the $55 price per ton of these river clamps the price actually paid by the company, or is that for material yet on order?

The Witness: As shown by table for chart No. 5, the cost for the clamps purchased in 1940 and in 1941, both

came from the company's gas plant records and therefore it [represent] actual cost paid for clamps actually purchased.

Mr. Littman: And do they reflect all the discounts that were actually obtained by the company?

The Witness: They do.

Mr. Lee: Does the cost per ton vary with the quantity [fol. 1485] taken? I notice there is quite a difference: 400 tons in 1941 and 140 tons in 1940.

The Witness: The witness is not prepared to answer that question.

By Mr. Wheat:

Q. As a matter of fact, Mr. Watkins, in 1941 more river clamps were ordered, to-wit, 400, than were ordered in 1940, to-wit, 140; is that not true?

A. Yes, sir, that is correct.

Q. So that if any shaving of price were customary in connection with larger orders of river clamps you would have expected a lower price for the 1941 orders than for the 1940 orders, would you not?

A. That is correct. And it is the witness' view that whatever weighing is required to make the prices comparable in the two periods is in evidence in the data shown in the table for chart No. 5.

* * * * * * * * *

Chart No. 6 and the table for chart No. 6 contain a comparison of cost of master control valves for gas wells as to 7-inch and 8⅝-inch valves, and are stated in hundreds of dollars per unit.

The data from which chart No. 6 has been prepared is [fol. 1486] shown on the table for chart No. 6.

The comparison of the 7-inch valves purchased during the year 1938 and during 1941 show costs respectively of $145 and $152 per unit, while the comparison for the 8⅝-inch valves purchased during the year 1938 and the year 1941 show comparative costs, respectively, at $230 and $250 per unit.

Q. These are actual purchases made by the company, as shown by its records? A. That is correct.

* * * * * * * * *

Chart No. 7 and the table for chart No. 7 show a comparison of costs of pipeline construction of various sizes, loop lines constructed in several sections of the company's system.

The cost is stated in dollars per foot, and the information from which chart No. 7 was prepared is shown on the table for that chart.

* * * * * * * *

[fol. 1487] This is a comparison of the cost of construction including, as shown, I believe, on the chart, the cost of ditching, stringing, welding, painting and laying of the pipe, and back-filling of the trench in which the pipe is laid on comparable projects, and does not include the cost of materials.

So that we have a comparison of the loop lines constructed in the counties of Ralls and Pike Counties, Missouri and Pike County, Illinois, as shown by the first two bars in chart No. 7, for the years 1940 and 1941 of 85 cents per foot for the year 1940 and $1.29 per foot for 1941, and for the loop lines constructed in Christian, Macon, Moultrie and Douglas Counties, Illinois, for the same periods, $1.13 per foot for the year 1940 and $1.28 per foot for the year 1941.

And for the 24-inch loop lines constructed during the same years in Scott and Morgan Counties, Illinois, a cost per foot of pipe line construction in 1940 of $1.13, which rose to $1.40 in 1941.

And for the 20-inch loop lines in Douglas and Edgar Counties, Illinois, $1.09 and $1.27 per foot for the years 1940 and 1941, respectively.

The data from which chart No. 7 was prepared is taken from actual construction contracts completed during the year 1941 and from actual construction contracts entered [fol. 1488] into during the year 1941 but not yet completed.

Q. But they are actual costs being suffered by this company, are they not? A. They are, indeed.

Q. Now will you turn to chart No. 8 and to the table for chart No. 8, which deals with compressor station en-

gines, and state first what is shown on the charts and the tabulation, and then state whether you have shown anything here for the 1300 horsepower compressor engines?

A. Chart No. 8 and the table for chart No. 8 form the basis of a comparison of the cost of a 1,000 horsepower Cooper-Bessemer compressor station engine in the year 1940, purchased in the year 1940, and in 1941, and are stated in thousands of dollars per unit.

The engine purchased during 1940 cost $43,200; the one purchased during the year 1941 cost $46,500.

Q. You refer to the years 1940 and 1941, Mr. Watkins?

A. That is correct. The 600 horsepower Clark Brothers engine: One was purchased during the year 1939, which cost $22,800, while the one purchased during the year 1941 cost $24,600.

Q. All as shown on table for chart No. 8, taken from the company's gas plant records. A. That is correct.

Now, with respect to the 1,000 horsepower unit shown in [fol. 1489] the first block of this chart, the company has just recently entered an order for an additional unit for which the cost will be $52,200.

The costs with respect to these compressor station engines are the costs at the factory.

Chart No. 8 does not give a comparison of 1300 horsepower units.

Q. Have you the data with you on which such a comparison could be given? A. Yes.

Q. Will you please state it.

A. Yes. On October 7, 1941, Panhandle Eastern Pipe Line Company ordered two 1300 horsepower Cooper-Bessemer compressor station engines, the cost of which will be $64,000 at the factory.

The last recent purchase of a unit of this size occurred in the year 1940, and the cost at the factory of that unit was $52,200.

Q. So had you added a chart for the 1300 horsepower unit it would have shown the same comparative trend upward in price that is shown for the compressor station engines you have included in Exhibit 73 for identification; is that true?

A. That is true.

* * * * * * * * *

[fol. 1490] Mr. Wheat, the witness believes he made an error in stating the cost of a thousand horsepower unit recently purchased.

Q. Please correct it if you did, sir.

A. The witness believes he stated that the unit cost $52,200. The actual cost was $57,000.

Mr. Littman: That is at the factory, isn't it?

The Witness: Yes.

* * * * * * *

Chart No. 9 consists of a comparison of the cost of automobiles.

The comparison covers Ford V-8 "85" coupes and Ford V-8 "85" one-half ton pickups, and Oldsmobile "6" Tudors.

Q. Those are types of automobiles which are in actual use in the plant of this company?

A. That is correct, and we selected these particular types because out of the entire purchases for the fleet as a [fol. 1491] whole these three types were those that seemed to be more representative of equalized freight costs.

The Ford V-8 "85" coupes, purchased during the year 1938, cost $711 per unit, while those purchased during the year 1941 cost $892.

* * * * * * *

Q. What did you find with respect to the Ford V-8 "85" one-half ton pickups?

A. There we found the units purchased during the year 1938 had cost $682 while those purchased in 1941 cost $731.

* * * * * * *

The Oldsmobile "6" Tudors purchased during the year 1938 cost $1014 while those which were purchased during 1941 cost $1173.

Q. Now, Mr. Watkins, considering the data which you have shown in Exhibit No. 73 for identification, would you say that the charts and the tabulations in that exhibit show that there has been a trend upward or downward in

the prices suffered by Panhandle Eastern Pipe Line Com-
[fol. 1492] pany for the items covered?

A. I would state that the data most definitely shows there has been an upward trend.

Mr. Wheat: I think that concludes the direct testimony of this witness.

Mr. Littman: There has been a decided upward trend in the revenues, too, hasn't there, Mr. Watkins, or don't you propose to put in an exhibit on that?

Mr. Culton: You mean from MCF?

Mr. Littman: Well, both ways: MCF and in total.

The Witness: There has already been introduced through this witness Exhibit No. 49, which shows the total operating revenue of the company for the period from April 1, 1932, to December 31, 1941.

Mr. Littman: That is in Exhibit 49, isn't it?

The Witness: That is correct. The witness referred to that exhibit number.

* * * * * * * *

[fol. 1493] Louis Fenn Sperry, recalled as a witness on behalf of the respondent and duly sworn, testified further as follows:

By Mr. Wheat:

* * * * * * * *

Q. Have you since the last hearing prepared at my request, which was made pursuant to a request of the presiding Examiner, certain tabulations of data from your testimony on the subject of materials and supplies?

A. I have.

Q. And have those tables been prepared in a document of four pages, containing four separate tables showing the various figures which were used by you?

A. Yes. They include, however, figures on overall working capital as well as materials and supplies.

Q. Yes. In other words they are tabulations of data already contained in your testimony but put into usable form? A. That is right.

[fol. 1494] Q. May I ask you whether the document which I now show you is the tabulation to which you have just referred (handing)? A. That is it.

* * * * * * * *

Trial Examiner: It will be marked for identification as Exhibit 74.

* * * * * * * *

Q. Mr. Sperry, all of the figures contained on Exhibit 74 for identification are figures already contained in your testimony, are they not?

A. With one exception.

Q. Will you please state what that is?

A. The total on table 1 varies from the figures in the transcript of the testimony by a total of $50.

Q. Yes? A. In the amount of $374,000.

This discrepancy apparently arises out of a typographical error in the transcript.

The figures on this table are the correct ones.

* * * * * * * *

[fol. 1496] RALPH E. DAVIS, a witness called on behalf of the respondent, and, having been first duly sworn, was examined and testified as follows:

Direct Examination.

By Mr. Culton:

Q. Your name is Ralph E. Davis? A. Yes, sir.

Q. And you are the President of Ralph E. Davis, Incorporated? A. Yes, sir.

Q. What is the business of that company, Mr. Davis?

A. Consulting engineers and geologists and particularly in the field of natural gas and petroleum work.

Q. How long have you been engaged in that class of work?

A. I have been engaged in engineering and geological work for 35 years.

For something over 20 years practically all of my professional work has had to do with natural gas and petroleum.

Q. Were you employed about February of 1937 to prepare a valuation of the gas reserves of Panhandle Eastern Pipe Line Company located in the Panhandle and Hugoton Fields?

A. Yes. Some time prior, I believe, to February 1st I was employed.

Q. As of February 1 did you make a report of your [fol. 1497] valuation? A. Yes, sir.

Q. In that report did you give both your judgment of the then value of the reserves and the methods used by you in arriving at that conclusion? A. Yes, sir.

Q. I hand you a document entitled "The Panhandle Eastern Pipe Line Company—Natural Gas Supply—Value of Gas Reserves and Wells—February 1, 1937," is that a copy of the document which you delivered at that time (handing)? A. Yes, sir.

* * * * * * *

Trial Examiner: This document will be marked for identification as Exhibit 75.

* * * * * * *

By Mr. Culton:

Q. Mr. Davis, does the valuation contained in Exhibit 75 for identification represent your best judgment of February 1, 1937, of the then value of the gas reserves in the Hugoton and Panhandle Fields belonging to Panhandle Eastern Pipe Line Company and fully referred to in that exhibit? A. Yes, sir.

Q. And the bases set up in that exhibit for determining [fol. 1498] value are the bases which you used in arriving at your value?

A. That is correct. You referred to reserves a moment ago and now to value.

Q. Yes.

A. My answer is that the bases—

Q. You used the bases set out in here both in determining the amount of reserves you considered and the value of those reserves?

A. In both the determination of reserves, Mr. Culton, and the judgment regarding value, I feel that I have applied my general knowledge and experience as well as the particular detailed arithmetical calculations which are shown.

Mr. Culton: Yes. That's all.

By Mr. Littman:

Q. This estimate is what is commonly known as an estimate of the cost of reproducing the wells and leases of Panhandle Eastern Pipe Line Company, is it not?

A. No, I think not, sir.

Q. Well, what was the basis of your value of the leases, market value?

A. In a broad sense, I think so, yes. Yes, in a broad sense.

Q. And how did you generally place a value upon the wells?

A. I think if you have reviewed that report carefully [fol. 1499] you will find that I did not specifically place a value on the wells then owned.

Q. What I am trying to get at—I think perhaps Mr. Culton will understand.

Mr. Culton: You might just briefly give him—he has not had an opportunity yet to read this—you might just briefly give him the method used for determining value, the methods which were used.

The Witness: In the first place the Panhandle Eastern Pipe Line Company owned on the first of February, 1937, very substantial amounts of gas reserves, primarily leasehold lands in the Amarillo Field and in the Hugoton Field, and in each case the greater portion of the acreage thus controlled was in the area then regarded as a proven area.

I had been familiar with the Amarillo Field since the days of its first development and I had made many studies regarding gas reserves in that field, and the same would apply to Hugoton, and I brought those studies of reserves down to a very recent date as compared to February 1, 1937, and then I studied the character of the leasehold property of the Panhandle Eastern Pipe Line Company in each field to determine if their acreage was to be considered, let's say, average acreage, or would it be considered better than average, or less than average, and I came to a conclusion as to the proven reserves which I believed were [fol. 1500] recoverable and controlled by Panhandle Eastern in each field, in the Amarillo and the Hugoton Fields.

At the time of the study Panhandle Eastern were delivering to market slightly more than 20 billion cubic feet of gas annually.

The rate of delivery has been growing rather rapidly and there was very definite knowledge that in the very near future their deliveries to the markets would very substantially increase, and at that time we anticipated an early—that is, within a year or two or three—delivery of an annual amount of about 30 billion feet, and believed that that would gradually thereafter increase to some 40 billion cubic feet per year.

I had knowledge of the relative position of the company's controlled reserves through leasehold as compared to the reserves controlled through gas purchase contracts, and formed a judgment as to what quantity of gas I believed that the company would take from the Amarillo Field and from the Hugoton Field over a future period of 25 years.

I limited my estimate to 25 years for reasons which I considered good.

I had knowledge gained from a study of the company's operating experience as to the cost to them of producing gas. I knew that the cost of producing gas was greater per M cubic feet in years of low production and that the cost [fol. 1501] was substantially less in years of high production.

I looked forward to an increased delivery, and I estimated the future producing cost at an average overall of eight-tenths of a cent per thousand cubic feet, which figure did not include royalty, nor the cost of carrying undeveloped acreage nor did it include the cost of drilling new wells, nor did it include any cost of depreciation of old wells, nor depletion of gas lands.

It was eight-tenths of a cent per MCF for the so-called out-of-pocket operating cost.

I had fair knowledge gained through the years of what gas was worth in the Amarillo Field to those who were purchasing gas, and also in the Hugoton Field.

I knew the rate at which the company and others were making royalty settlements in each field.

I reached the conclusion that gas in the Amarillo Field would, during the 25-year period that I was anticipating, be worth at the well-head not less than four cents per MCF and in the Hugoton Field not less than four and one-half cents per MCF.

Now, there I had the basic elements for a so-called engineering appraisal in the estimate of the amount of gas which would be produced, the gross value of that gas at the well-head, the cost of bringing it to the well-head, and the time period during which the income would be derived. [fol. 1502] The frequently used method of applying a discount for deferment was applied by me, but instead of doing it on a certain percentage basis, such as eight per cent annual compound discount rate, such as that, I chose the shorter method of applying a 60 per cent discount to the expected net revenue.

In other words, the value on the basic data arrived at by me was 40 per cent of the expected net income and after due allowance for not only operating expense but the royalty payments to be made, payments on unoperated acreage, and the annual rentals, and the expected investment that would be required in additional wells.

Now, that sort of an appraisal—I call it an engineering appraisal—was presented in this report as reflecting fairly what my judgment led me to believe was the fair value of the acreage in each of these two fields which would contribute to the 25-year program.

The company held a substantial amount of acreage in addition to that which I have described, acreage that was so distant from its gathering system in each field, that I doubted it ever would be called upon for the purpose of delivering gas within the 25-years, and if the amount annually amounted to only about 40 billion feet, and so I gave that other acreage an acreage value—if was undeveloped—it was isolated so far as this company's requirements were [fol. 1503] concerned—and I merely applied a value of so many dollars per acre to that.

Mr. Littman: Was that based on what a willing buyer would pay a willing seller, generally?

The Witness: Yes, sir.

Mr. Littman: I did not mean to interrupt you, sir. You may proceed, if you wish.

* * * * * * * *

By Mr. Littman:

Q. It is clear to me from your explanation, and I wish you would correct me if I am wrong, that your estimate of the value of the leases and wells of the Panhandle Eastern Pipe Line Company in the amount of $5,080,000 as of February 1, 1937, was not based upon original cost?

A. No, it was not, sir.

Q. It was not predicated upon any purported book cost?

A. Not at all, no.

Q. But was arrived at by the application of your judgment to the data that you described and in the manner in which you have just described?

A. That, and I think I should say that for a number of years past I was familiar with the requirements of the various pipe line companies for gas, from gas acreage.

I knew that this acreage had very substantial value, and [fol. 1504] I think judgment entered into it, although the figure $5,080,000 is, as you see, an arithmetic answer.

Q. That is multiplying the recoverable reverves in MCF by the amount per MCF, which you arrived at in the manner you have described?

A. That and other certain factors came to me and gave me the answer $5,080,000; and I adopted that as a fair representation of the value because it accorded with my judgment.

Q. In other words, generally speaking, it might be said this method reflects the value of the recoverable gas reserves in the ground as of February 1, 1937; is that generally correct?

A. That was my judgment in 1937, yes, sir.

Mr. Littman: I have no further questions at this time but I would like to have the record show that in the opinion of Commission counsel this exhibit falls in the same category as other exhibits which deal with reproduction costs, and our objection goes to the values or reproduction costs stated in the exhibit, and not to the witness' estimate of reserves.

I will ask you:

By Mr. Littman:

Q. You have in this exhibit 75 for identification an estimate of recoverable gas reserves, have you, Mr. Davis?

A. Yes, sir.

Mr. Littman: I would like to have it understood that [fol. 1505] this Exhibit 75 for identification is subject to our general objection to reproduction costs, but those parts of the exhibit which do not deal with reproduction costs are outside the orbit of the objection.

. . . . . .

[fol. 1506] Q. Mr. Davis, referring to your "Summary and Conclusions" on page 18, in which you estimate the combined reserves of the Amarillo and Hugoton Fields at approximately 30 trillion cubic feet, do you mean by that recoverable reserves?

A. I do, sir.

Q. Now, as to the 30 trillion cubic feet which you have in mind, your figure of eight-tenths of a percent is the out-of-pocket cost of production per thousand cubic feet, which is applicable, I take it?

Mr. Littman: Eight-tenths of a cent and not percent.

The Witness: That is right, eight-tenths of a cent per MCF.

By Mr. Goodman:

Q. Yes.

A. That does not include, you understand, the drilling of wells in the figure for depreciation and depletion. It is the actual cost of operation during the year.

Q. Assuming that adequate wells will be built for the [fol. 1506] extraction?

A. That is right, and exclusive of royalties.

Q. Yes. Merely operating costs and the necessary structures and equipment is provided?

A. That is right.

Q. All right.

A. That figure, by the way, is supported by a table showing historical costs over a period of a few years.

Q. You mean the figure of eight-tenths of a percent?

A. Eight-tenths of a cent.

Q. Eight-tenths of a cent, I mean.

A. I think it is supported by certain data shown in the report on page 32.

Q. 32. Yes, I see.

A. Do you care for me to give you any explanation?

Q. No, I don't think so.

A. On the chart No. 1, I would like to point one thing out, Mr. Goodman, that down about the middle of the page, on the left-hand column, you see a caption "Total Cash Expense" about the middle of the page.

Q. I see that?

A. Do you see that, sir?

Q. Yes.

A. If you follow that to the right, the cash expense per thousand cubic feet of gas produced in 1932 was four [fol. 1507] and six-tenths cents, the next year it was three and three-tenths cents, the next year two and one-half cents, and the next year two and one-tenth cents, and in 1936 was 1.64 of a cent.

Now, the trend downward is due to the increase in the annual delivery.

That figure of the figures that I have just read to you include royalties, and the royalties amount to a sufficiently important amount here so that I think you can come to the figure that I use, eight-tenths of a cent, as a reasonable expectancy for the future, when you have in mind that they were delivering 20 billion a year when I made the estimate, and I was anticipating 30 to 40.

Q. Now, you limit your estimate to a period of 25 years, and will that 25 years, with the production you have in mind, dispose of the 30 trillion cubic feet that you have in mind?

A. No, indeed.

Q. It will not?

A. No, indeed, but there are many factors, Mr. Goodman, that are of uncertain import that might bring about a discontinuance of this business after a period of 20 or 25 or 30 years.

I wouldn't know how to estimate it any more closely, but I have thought that 25 years was a fair and sound period of time, being aware of studies made by people able, in [fol. 1508] my judgment, to carry through such undertakings as I am going to refer to:

I have been engaged in recent years to study the possibility of taking gas from these very fields in pipelines of 28 to 30 inch diameter, high pressure lines, lines that would be expected to deliver gas for industrial uses in the Chicago-Milwaukee district to compete with Illinois Coal, and most any type of service.

In other words, I am talking of gas that would sell there for maybe only 15 cents, possibly less.

If such things come to pass, 25 years might be too long a period. It might be.

I have thought it a reasonable estimate.

If something like that does not come to pass, 25 years may be too short a period.

Q. But you allowed a certain margin of safety here, didn't you?

A. I am describing to you right now why I allowed as much margin as I did allow, was because I had knowledge of what people were thinking about.

Q. Now I am referring again to the difference between the 30 trillion cubic feet of recoverable gas and that which you considered would be taken in 25 years.

A. 30 trillion cubic feet—in 1936 or 1937 they were taking approximately a little more than 600 billion feet per [fol. 1509] year, between 600 and 650, two-thirds of a trillion, so on the matter of just plain arithmetic, if they never took it out any faster, and continued, and were able to take it out that fast, you might have an indicated future of 45 years.

I wouldn't know that the takes would be limited to two-thirds of a trillion a year. That's the reason I couldn't, in my studies and in my advice to investors, and that by the way has been the principal responsibility that I have had in matters of this kind, I couldn't advise them that they could be assured of more than 25 years.

Q. Well, what output did you actually figure upon in terms of billions of cubic feet per year?

A. Are you thinking now of the Amarillo and Hugoton Fields?

. . . . . .

I just stated to you that the withdrawal, which had been about 700, or a little more than 700 billion in one year—

Q. Well, it says 600 billion here.

A. There was a year in which there was about 700. I have the table.

Q. Gas is being produced in those two fields at a rate of approximately 600 billion cubic feet per year?

[fol. 1510] A. In 1935 the total withdrawal was 748 billion but by 1937 it was down to about 600—well, for 12 months ending July 31, 1936, the figure was 617 billion. In other words, it had dropped substantially for reasons we don't need to go into, maybe.

[fol. 1511] Mr. Goodman: Now, what output did you have in mind for the ensuing 25 years for the field as a whole?

The Witness: I had in mind they might produce anywhere from 600 billion to a trillion per year, something like that. I could not be too sure what industry might require. I recognize it might go to more than a trillion.

Mr. Goodman: So, did you have in mind a figure of the quantity of gas still recoverable which probably would be left in the field after 25 years?

The Witness: Well, I do not know how much they would take out in 25 years. I could only form a general idea of it. I saw they were taking something over 600 billion. I thought they might build that up to 800 billion or a trillion or more. I believed it would last 25 years. If I could have known how much they would have taken out in 25 years, I could give some notion of what the remainder would be, assuming that my estimate of 30 trillion cubic feet is a good estimate.

Mr. Goodman: I take it that you take 25 years to be a safe figure within which a quantity of 30 trillion feet recoverable reserves would be adequate?

The Witness: I do not exactly understand your wording there.

Mr. Goodman: I take it that you took the period of 25 years as a period of time in which recoverable reserves of 30 trillion cubic feet would be adequate?

Mr. Culton: Adequate for whom?

[fol. 1512] The Witness: I will say that I thought that 30 trillion feet in the fields, that is my estimate of what is there. I thought that would be adequate for 25 years, yes sir.

Mr. Goodman: Without any precise calculation as to what would be drawn from the fields other than a broad general estimate?

The Witness: That is right.

Mr. Littman: Mr. Davis, when you speak of the life of the reserves, are you referring to the reserves of Panhandle Eastern Pipe Line Company in the acreage owned by that company on February 1, 1937?

The Witness: To the extent that I placed a value on reserves, yes. I showed in this report that Panhandle Eastern controlled acreage reserves were vastly greater than the amount I estimated that they would require in 25 years, but I did not pretend to foresee to what extent increased demand in the field might make inroads into the reserve of the field as a whole, and, consequently, in the reserves of Panhandle.

Mr. Littman: Well, let me read a paragraph on Page 18 of your Exhibit 75, and ask you a question with respect to that.

"After giving consideration to all of the known factors affecting the future supply and probable demand, it is our judgment that Panhandle Eastern Pipe Line Company will be able to obtain, at reasonable costs, supplies of natural gas sufficient for its market requirements for a period of [fol. 1513] not less than 25 years."

Were you refetring, there, to the reserves owned by Panhandle Eastern?

The Witness: Yes.

Mr. Littman: You were not, of course, referring to the reserves not in the possession of Panhandle Eastern, were you?

The Witness: I was referring to the reserves controlled through, first, leasehold ownership, and, second, gas purchase contracts.

Mr. Littman: That is right.

The Witness: None other.

Mr. Littman: That is what I understood it to be. You stated that you are a geologist, did you not, Mr. Davis?

The Witness: I do not know whether I said so or not.

Mr. Littman: I understood that you were.

The Witness: I have played the game.

Mr. Littman: Are you what is known as a petroleum engineer?

The Witness: I do not know. I have played the game.

Mr. Littman: What degree do you have, maybe we can get at it in that way?

The Witness: I have a degree of Bachelor of Science in General Engineering.

Mr. Littman: You would call yourself, certainly, a practical geologist, wouldn't you?

The Witness: I think I get along all right.

[fol. 1514] Mr. Littman: Well, I think you have, too.

The Witness: I do not mean to be funny.

Mr. Littman: Neither do I.

The Witness: I studied geology in school. In fact, I majored in geology. I studied basic sciences, like chemistry, mathematics and physics and, eventually, I got into the petroleum and natural gas engineering work and there is nothing in it that a fellow cannot follow if he has got general knowledge of arithmetic and a little chemistry and a little physics. You do not have to have a degree, so far as I know.

Mr. Littman: You have been working at it for a long time, as you say?

The Witness: That is right.

Mr. Littman: Mr. Davis, you are quite familiar, are you not, with the Hugoton field?

The Witness: I have been familiar with it for a long time, at least.

Mr. Littman: Is it correct to say, or is it not correct to say, that the Hugoton field is today yet undefined?

The Witness: We must know what we mean when we make that statement. The meaning that would occur to my mind is that the limits of the field are not as yet defined.

Mr. Littman: That is what I mean, by dry holes, is that correct, Mr. Davis?

The Witness: Generally, that is correct, yes, sir.

[fol. 1515] Mr. Littman: Is it not only true, generally, but also pretty specifically, that is to say, how many dry holes have been drilled in the Hugoton field?

The Witness: Well, there have been a few.

Mr. Littman: A few?

The Witness: But let me point out to you that the limit of the field, particularly a field of the Hugoton type may be indicated by the size of wells. You know the Hugoton field is located on a very broad, gently dipping monocline and it is not, so far as we know, limited on the west by any structural feature.

We believe it to be limited on the west by a thinning out of the porous formation, just more shale and less sand, the gradual disappearance of the porous bed within which the gas occurs in commercial quantities in the central part of the field, so, as you go to the west and drill wells, instead of getting a 10-million foot well or eight or six or five, you get a one-million foot well.

To me, that indicates an approach to the edge of the field.

Mr. Littman: How about the south? Is it defined in the south?

The Witness: No, I think it is pretty wide open to the south.

Mr. Littman: Have you finished your answer?

The Witness: Yes.

Mr. Littman: In fact, so wide open that today no one [fol. 1516] knows where the Panhandle field ends and the Hugoton field begins, is that generally correct?

The Witness: I might bring to your attention this proposition that in the Hugoton field the production is obtained from the Permian Dolomite. That is one of the three formations that produces at Amarillo. In the Amarillo field, the production is from the Gray Lime of the Upper Pennsylvanian, it is from the Granite Wash lying deeper and it is also from the Permian Dolomite. At the Hugoton field the production is practically entirely and, so far as I know, it is entirely, from the Permian Dolomite.

Now, at the northwestern end of the Amarillo field, the gas is a sour gas, whereas, in the southerly end of the Hugoton field, as we now know the Hugoton field, the gas is a sweet gas and it is not just a certainty that these two things can come together and be a single field.

Here we have a peculiar field, a great body of sour gas in the northwest corner of Amarillo, and that is where the Hugoton field should be expected to connect, if it connects at all, and yet there is one field, one field producing in one formation, and the other producing in three. It is not at all certain.

Mr. Littman: And it is as yet undefined?

The Witness: It is undefined in that area.

Mr. Littman: And what about the east of the Hugoton field?

The Witness: The Hugoton field on the east, the wells [fol. 1517] that have been drilled out in the east are small wells. They are so small that I doubt, really, that they

are commercial wells. Personally, I would not recommend the selection of acreage east of the line which, on my map of, at any rate, on my 1941 map, indicates the easterly edge of the field.

I think beyond that, gas may be found, in commercial amounts, may or may not, but generally the wells in that eastern border are small wells, indicating to me probably edging out of the field, although it is not defined by dry holes.

Mr. Littman: It is your testimony, I take it, that the Hugoton field is generally yet undefined by dry holes?

The Witness: I say the Hugoton field is not as yet definitely defined. It is not as yet definitely defined by dry holes but I think it is approximately defined to the west, northwest, and to the east by these small wells, which I personally do not consider sufficiently large, under present conditions, to be commercial.

To my mind, the field is pretty well defined by the type of edge wells we are getting, although they are not dry holes, except in certain instances they are dry.

Mr. Littman: How about the north? I am speaking of the north of the Hugoton field?

The Witness: Up there, north of what we have been calling the Hugoton field, sometimes, not too long ago some one brought in an oil well. I have not paid much attention to that. I rather think it indicates the north [fol. 1518] limit of the Hugoton field.

Mr. Littman: One oil well?

The Witness: That is all I recall.

Mr. Littman: You do not know anything about that well?

The Witness: I was told that it was a fair well.

Mr. Littman: But you have not examined the well log or the situation up there?

The Witness: That is right.

Mr. Littman: Or made any investigation with respect to that one oil well in the north, have you?

The Witness: No, I have not.

Trial Examiner: We will take a five-minute recess.

(Whereupon, at this point, a short recess was taken, after which the hearing was resumed.)

Mr. Littman: Mr. Davis, in looking through your Exhibit 75 rather hurriedly, I cannot find the abandonment pressure that you used in determining your estimate of reserves in the Texas Panhandle and Hugoton field. Could you tell us what abandonment pressure you used in arriving at this?

The Witness: That report that you have as of February 1, 1937, followed very shortly a report that was made as of November 1, 1936, and I think I gave some explanation and some data in the 1936 report that was not again repeated, and I believe that in that 1936 report, at least, I stated that it was quite impossible to anticipate at what average pressure the field would finally be abandoned as a [fol. 1519] major producer of gas, that I thought that possibly 30 pounds per square inch at the well head would be a reasonable figure to use.

Now, that was my view back in 1937 and I believe I did use that figure, and then I made some adjustment from what would have been a theoretical answer based upon Boyle's Law to take account of the then recognized fact that a substantial amount of the acreage in the Amarillo field was what we term "marginal acreage", acreage that is not as good as the best commercial acreage.

I made adjustment for abandonment at 30 pounds, for marginal acreage, being less than average in quality and for deviation from Boyle's Law and, after making those adjustments, reached the conclusion as stated in the report regarding the over-all gas reserves.

Mr. Littman: Are those adjustments shown in your Exhibit 75?

The Witness: Not in detail.

Mr. Littman: Could you state approximately what was the percent of the reserves ascertained by the application of the rock pressure decline method with the use of a 30-

pound rock pressure abandonment pressure? Did you discount for the other factors that you mentioned?

The Witness: You will note, or I will say to you, that as of July, 1936, the average pressure in the Amarillo field [fol. 1520] was determined to be approximately 355 pounds. That is the nearest date to February 1, 1937, that we had at the date of my study.

The pressures of wells in the Amarillo field are taken by the Railroad Commission of Texas once a year, usually in July and August, and those pressures are plotted on a map. Lines of equal pressure are drawn thereon, and the pressure of the field is determined, weighting the areas of certain pressure according to their size.

In other words, if I have 100 thousand acres with an average pressure of 300 pounds and I have 200 thousand acres with an average pressure of 400 pounds, then the 400-pound figure gets twice the weight that the 300-pound figure gets, because it applies to twice as large an area.

The average pressure, as determined in July, 1936, was 355 pounds. The original pressure in the field had been 430 pounds, so you will note a decline in pressure of 75 pounds down to July, 1936.

Considering the total amount of gas that had been withdrawn from the field, including the best estimate that we have of gas wasted, the figures that are adopted by practically everyone who deals with this problem in the Amarillo field indicated, in 1937, that the production of gas per pound drop in pressure of gas in the field had been at an average rate of about 68½ billion feet for each pound drop.

Now, if I applied that figure to the remaining pounds, I [fol. 1521] would have an estimate, 68½ multiplied by 355, but instead of doing that, I applied 68½ multiplied by the difference between 355 less 30, or 325, and you will see that 30 pounds is a little less than 10 percent of 355 pounds, so there was a nine-percent, we will say, reduction in the estimate to take account of the assumed abandonment pressure.

Now, to allow for the deviation from Boyle's Law I recall that the allowance for that was approximately 5 per-

cent and, in the same direction, a reduction. The allowance for marginal acreage was also about 5 percent and in the same direction, so I had a total reduction of about 19 percent to account for the three things I have mentioned.

Mr. Littman: Was that also true of Hugoton field, as well as the Texas Panhandle field?

The Witness: No, sir.

Mr. Littman: Can you give us the method used in that field?

The Witness: The Hugoton field was developed so much more recently than the Panhandle field, so little gas had been withdrawn from Hugoton by February, 1937, it seems to me that not more than 100 billion feet had been taken from field, and that was such a modest amount, as compared to the totals we are dealing with, you could not use it as a basis for making a reserve estimate.

Mr. Littman: You could not use [what] as a basis, you mean Boyle's Law, the application of Boyle's law?

[fol. 1522] The Witness: You could not use what we call the pressure decline and related production method. The decline in pressure in the Hugoton field had affected only a limited part of the area, 5 percent of the Hugoton field, 5 percent I would say offhand, and, certainly, not more than 10 percent, most of the field had shown no decline in pressure, a limited part, something like 5 or 10 percent, showed a very modest decline in pressure and with only 100 billion feet of gas withdrawn and with only something like 10 or 15 or, on the outside, 20 pounds of decline and in a very small part of the area, it was too small a base—it would be like trying to determine the distance from here to that building (indicating), using as a base line here something like a quarter of an inch.

If we had three feet to use as a base line and surveying instruments, we could get the distance over there within an inch or so. With a quarter-inch, we would be pretty good if we got within a rod, or two or three rods.

Mr. Littman: So you did not use any abandonment pressures in the Hugoton field for that reason?

The Witness: I would not say I used no abandonment pressure in that field, but what I did in the Hugoton field was this:

We had certain studies that had been made of materials taken from the wells, samples of the producing formation had been sent to laboratories for the determination of porosity. We knew something about the thickness of the producing zone. We knew that it was the Permian dolo- [fol. 1523-4] mite which is also productive down at Amarillo.

We had some line on what that formation should produce from one acre, based upon the thickness of the porous zone and the approximate porosity of it, the pressure.

In other words, a volumetric calculation was made.

Mr. Littman: Isn't that called the porosity method?

The Witness: That is frequently called the porosity method and the very first studies that I made of that, my figures were too high. I thought the gas per acre would be more than I now believe, and the reason for that error was this, that the sample sent to the laboratory, the laboratory man just tested the best part of the sample and I did not know that.

I thought he tested at random, but as I say, he selected the parts he wanted to test, and I got my figure too high, but I happened to do that back in a year when it did not make any difference because the acreage I was dealing with was the only acreage that was producing at the time, and it has already produced more gas than I gave it per acre because it has had the surrounding field from which to draw, but coming right down to what you want, I think that the Hugoton field is now practically proven throughout an area of more than two million acres.

I think that it will produce over all an average of not less than 7½ million cubic feet per acre. That indicates a future ultimate production of at least 15 trillion feet.

[fol. 1525] Mr. Littman: If you were making an estimate of the gas reserves in the Hugoton field today, would you use the rock pressure decline method in preference to the porosity method?

The Witness: We do not have enough data yet. It is still, in my judgment, a very dangerous thing to use because the gas production has come first from a limited part of the field.

It is very difficult to determine how much replenishment there has been into that area from the outside during the ten years of gas withdrawal.

I would do this: I would prepare a pressure contour map of the field. I would make a study, using the pressure decline method, and then I would also make a study based on the volumetric method, and I would take into account, particularly, the indicated better than average gas conditions in the south end of the field as compared to the central part where gas had been produced.

I would study these several different things and bring them together. That is what I really do. I call it 7½ million per acre today, and that is not any pure volumetric method nor pressure decline method.

It is partly a judgment method. It is partly based on what I know the Permian will do in Amarillo, where it has been productive a long time.

Mr. Littman: Is that 7½ million per acre the recoverable reserves, that is, after discounting for abandonment pres- [fol. 1526] sures and the other discount items that you mentioned a few moments ago?

Mr. Culton: I would suggest, when you said 7½ million, that is M. c. f.

Mr. Littman: Yes, 7½ million cubic feet.

The Witness: Yes, that is right. That is what I mean, recoverable.

Mr. Littman: Your answer to my question as to the discount factor was yes?

The Witness: Yes.

Mr. Littman: In making estimates of reserves in the Panhandle field, which method would your prefer, the rock pressure decline method or the porosity method?

The Witness: There are objections to each method. There are difficulties in the application of each of the two methods. The difficulty in applying the porosity method is that no man in the world knows much of anything about what the porosity is.

Mr. Littman: You cannot tell what it is, in the Panhandle field, can you?

The Witness: Nobody has ever taken a core of even a single well so far as I know, and had the porosity determined throughout the pay zone from top to bottom, but even if he had done that and had done it for 25 wells, he still would have only 25 samples in a field 125 miles long, so he would not have anything, anyway.

He would have another one of these little things one-[fol. 1527] quarter inch long to measure the Washington Monument with. We know pretty well how thick the producing zone is in the Amarillo field from data from more than a thousand wells. I think the figure is 71½ feet average thickness, but nobody knows whether the porosity is 20, 30 or 35 percent.

The boys who use 20, think 20 is a good figure to use. I think 30 would be a better figure, myself. The reason I think 30 would be better is because it must be 30 if the answer we have by the other method is right.

Mr. Littman: By "the other method", you mean the rock pressure decline method?

The Witness: That is right.

Now, the rock pressure decline method has this uncertainty about it, that the pressure in this great field of almost 4½ million acres has not gone down uniformly throughout the whole field. The pressure has gone down more in the area of greater than average production and less in the marginal area, so when I find the average pressure in 1940 to be 320 pounds, and if I made my study without any correction for the marginal acreage.

I would be getting too high an answer. I am satisfied that I would be too high if I did that and, therefore, I must make some correction.

Well, the best that we know about the field is that there is about 450 thousand acres, in round figures, of marginal acreage out of 1,467,000, which leaves a little more than a [fol. 1528] million acres of what we call the best commercial acreage.

That acreage has produced most of the gas that has come from the field.

I have made many attempts to solve that problem. Without going into detail with you, I believe that the correction factor that I apply takes care of the fact that the marginal acreage will be less productive.

Mr. Littman: And that is the correction factor which you mentioned a few moments ago, namely, of 30 pounds abandonment pressure—

The Witness: (Interposing) Not the 30 pounds, that has nothing to do with it.

Mr. Littman: Plus the two 5 percent factors?

The Witness: Just one of those 5-percent factors.

Mr. Littman: Which one is that?

The Witness: Not the one that has anything to do with the deviation from Boyle's Law, but the one that has to do with marginal acreage.

Let me point out this: If I had [being] doing this problem back in 1930, when the decline in pressure had been very, very little, one percent correction for marginal acreage would have been sufficient.

But, by the time you get down to January or February of 1937, I tell you 5 percent at that date was a sufficient correction. Now, in 1941, it would require a higher correction.

[fol. 1529] Finally, at the late 1955, 1960, when you get down there, we are going to be making still greater corrections. You can see that the first year there would not be any correction and, in the last year, it would be a maximum.

Mr. Littman: What would you say would be the proper correction factor to apply as of, say, June, 1941?

The Witness: June, 1941, for the west field, I think around 7 or 8 percent, 7 percent probably, for the west

field; and for the east field, pretty close to 20 percent; for the combined field about 10 percent.

Mr. Littman: Which field does Panhandle Eastern have its acreage in?

The Witness: In the west field.

Mr. Littman: And what figure would you give as the estimated original recoverable reserves per acre for the Texas Panhandle field, that is, the west field, which would be comparable to the 7½ million cubic feet per acre that you gave a few moments ago for the Hugoton field?

The Witness: Well, it would be 18 or 19 million feet per acre.

Mr. Littman: That figure represents the recoverable reserves?

The Witness: Yes. I always mean that unless I specify otherwise.

Mr. Littman: I believe there is one question that you [fol. 1530] have not answered for me, and that is what abandonment pressure would you use today in the Hugoton field?

The Witness: Today?

Mr. Littman: Yes, in estimating reserves—well, let's say as of June 30, 1941.

The Witness: Well, I think I would not go below 50 pounds. I do not know that I would go that low.

You see, in Amarillo, the formation is so much more permeable. You get so much more gas from a well.

Mr. Littman: I believe I asked you about the Hugoton field, sir.

The Witness: Yes. I am saying, though, that at Amarillo you get so much more gas from the wells when the pressure is 340 pounds than you get at Hugoton. I believe, when you get down to, say, 50 pounds in each case, I think we will be getting several times as much gas per well in Amarillo than in Hugoton; so, if the pressure is properly estimated at somewhere between 30 and 50 pounds

at Amarillo, and that is my present judgment, then the abandonment pressure at Hugoton will be somewhere between 50 and 100 pounds.

Mr. Littman: Can you estimate it any closer than that?

The Witness: If I could, Joe Crevelling would probably be willing to pay me $50 more for the job.

Mr. Littman: There have not been any wells abandoned in the Hugoton field on which to predicate an actual figure?

[fol. 1531] The Witness: Even if there had been, that would not mean anything. These wells that are abandoned early in the history of a field, they are usually abandoned for a specific cause.

Mr. Littman: I take it, it is pretty much of a guess what the proper abandonment pressure should be?

The Witness: It is going to depend, in a large manner, on the economics of the thing, 20, 30 or 25 years from now, the economics, what is gas worth. That is going to be a big factor.

Mr. Littman: I take it the specific answer to my question is yes, it is pretty much of a guess?

The Witness: That is right.

* * * * * * * *

[fol. 1535] Mr. Goodman: Can you tell us the applica-
[fol. 1536] tion of your testimony concerning reserves and your exhibit relating to conditions of 1937 to the present time?

The Witness: Well, there has been a great deal of water gone over the dam since 1937. There is a very, very different business picture in front of Panhandle Eastern today as compared to 1937.

Their present deliveries of gas are of the order of 60 billion feet per year. Back in 1937, I was talking about 30 to 40 and, in forming a judgment of the value of their gas lands, gas reserves in 1937, I was relating that to the amount of gas that they could market from their acreage

over the 25 years I had in mind, and a study of my report will show that I used up, in that 25 years, only a very modest part of their total reserve.

I come to 1941, I see a company delivering 60, with the prospect that they will build that up to 80. I do not know what they will build it to, but I know from this recent study of mine that they have in the two fields reserves that justify this greatly increased delivery and, based upon the conditions of 1941, the reserves of gas lands are worth at least twice what they were in 1937.

Mr. Goodman: How about quantity of reserves in 1941?

The Witness: They have plenty of reserves in 1941.

Mr. Goodman: Could you give me a more definite figure?

The Witness: I will see what I have right here. Here [fol. 1537] is a study as of September 30, 1940, and the total proven acreage under leasehold control in the two fields combined was 235,594 acres, and the gas reserves controlled through gas purchase contracts in the two fields covered 56,868 acres.

* * * * * * * *

[fol. 1588] J. D. Creveling, a witness called on behalf of Panhandle Eastern Pipe Line Company, being first duly sworn, was examined and testified as follows:

Direct Examination.

By Mr. Culton:

Q. Your name is J. D. Creveling, and you are President of the Panhandle Eastern Pipe Line Company.

A. That is correct.

Q. How many years' experience have you had in the gas business?

[fol. 1589] A. I did my first work in connection with the natural gas industry in 1904 and have worked, at least a part of every year, from that year to date in such industry.

Q. Detail the types of experience you have had.

A. Well, in 1904, strange as it may seem, I started to work for a natural gas company as a carpenter. In those days, we used much wood in the construction of structures,

especially compressor stations, and the first work I did was on a compressor station which was one of the first large gas-engine driven compressor stations built in the United States, near my home town of Mount Vernon, Ohio.

Thereafter, I worked for gas companies continuously in the summer time in positions of responsibility, at all times having charge of construction or operations and, in the early days, I was going to school in the winter.

In 1913, I went to Oklahoma in charge of the construction of what is now known as the Tallant Compressor station in Osage County. I came back to the Ohio territory after that work was concluded and have, since about 1915, worked continuously for natural gas companies, principally in the States of Ohio, West Virginia, Pennsylvania and some in Kentucky until 1918, at which time I returned to Oklahoma in charge of all construction work for the Cities Service Company in the mid-continent having to do with natural gas and natural gasoline activities.

I remained in Oklahoma—

. . . . . .

[fol. 1590] The middle of 1919, July 1, I think is the exact date, I was moved to the New York office of Cities Service Company as head of natural gas activities of that company for all of its properties operating in at least fifteen different States and in the Province of Ontario.

I remained with that company in that capacity until the middle of 1936 and during that time, I did some consulting work, principally for the La Habra Gasoline Company of Los Angeles, California, the Monongahela-West Penn. Power Company at Fairmont, West Virginia, and the J. G. White Engineering Company of New York City, at which time, that is, the middle of 1936, I resigned to accept the Presidency of the Panhandle Eastern Pipe Line Company, which position I have held to date.

Q. Have you, for some years, been connected with any trade association?

A. Yes. In 1923—you know, these dates go back a long ways—I was President of the Natural Gas Association of America, at which time I introduced a famous geologist, Mr. Ralph E. Davis, to the industry.

I have been a member of various important committees having to do with industry matters for many years and, [fol. 1591] for many years, I represented the industry on the Advisory Council of the Bureau of Mines at $1.00 per year and I have not received any compensation yet. I have been, for many years, and am now, natural gas representative on the Board of Directors of the American Petroleum Institute.

Q. I believe you stated you came with the Panhandle Eastern Pipe Line Company as President in 1936. Do you recall what time of the year it was, about?

A. It was in June, 1936.

Q. At the time you came with the company, did you have a general knowledge of the company and its markets?

A. It was part of my duties, in the position occupied immediately previously, to be well acquainted with activities of the industry throughout the entire country. I did, therefore, have what I consider was a fair general knowledge of the Panhandle Eastern Pipe Line Company and its then existing and potential markets.

Q. After you became President, did you take steps to further familiarize yourself with the company?

A. I did, naturally, the first one of which was a careful investigation and appraisal of the personnel. This, under any circumstances, would be an important first step. It was an especially important first step in this particular case because of the fact that I was taking the place of a man who had built up this personnel and who, because of [fol. 1592] certain legal conditions, could no longer be a principal officer of the company and he was still a member of the organization.

It was only natural, therefore, that I assure myself, not only of the quality of the personnel, but also that the personnel was one whose loyalty was first with the company, rather than with an individual. I made such a check and found what I considered the nucleus of a very fine organization, and found the spirit universally all that could be expected.

. . . . . .

[fol. 1593] Q. Mr. Creveling, I assume that one matter to which you probably gave some attention was gas reserves.

Before discussing those, I would like for yor to give me a definition of what you consider to be an integrated gas company.

[fol. 1594] A. Of course, an integrated gas company, which we are not, would be one having an adequate reserve, transmission facilities of sufficient capacity, and markets all in balance. We do not have any retail markets.

Q. In other words, you own no distribution facilities?

A. That is right.

Q. What is the type of company represented by Panhandle Eastern Pipe Line Company?

A. Production and transmission, its business being largely wholesale.

Q. Irrespective of the meaning which might be given the same word under other circumstances, I would like to have you give us your definition of operative acreage, from the standpoint of the owner of a pipe line company?

A. Our conception of operative acreage is that acreage essential to the successful conduct of its business over a period of years commensurate with its ability or with its financial requirements and the requirements of the markets which it serves.

Q. What is the necessity for a company of this kind to have acreage of this character?

A. This acreage, of course, might be compared, if you please, to a coal pile. We cannot expect to sell our commodity to prospective customers on a day to day basis. We must be able to approach them on a basis that will warrant them changing from whatever fuel they are then using and incurring the cost incident for a long enough [fol. 1595] time to, in their judgment, enable them to economically justify the change.

A company such as this also, and by "such as this", I mean one that has been and still is rapidly growing, must attract new capital. The size of our reserves must be adequate, from that standpoint, to satisfy any prospective capital, especially that which is taken into the company in the form of debt, must be of an adequacy beyond the maturity of that debt.

Q. Did you, when you first went with the company, check into its reserves for the purpose of determining the adequacy?

A. Amongst other things that I am not, I am not a geologist. I appreciated the fact, however, that the question of reserves was an important item. I was of the general opinion that the reserves up to that time, in view of the markets that had been attached, were adequate.

I was not certain of the amount of those reserves, however, or their adequacy looking into a reasonably expected future. To that end, I employed Mr. Ralph E. Davis to make an estimate of the reserves and a valuation thereof, both in the Hugoton field and the Amarillo areas, and the results of that investigation are a part of the records of this company. That was done late in 1936 and early in 1937.

. . . . . .

Q. Since that time, has the company made any additions [fol. 1596] to, or changes in, its reserves and, if so, why and what changes?

A. We have. In the Amarillo field, we have acquired very little additional acreage under lease. We have, however, acquired considerable acreage under purchase contracts for the life of commercial production on those leases.

We acquired that reserve largely under purchase contract for various reasons, one of the important one being that the location of these reserves was such, in reference to our own reserves, that it better blocked those reserves and made for a more economic production of these reserves over their life.

In the Hugoton field, a slightly different condition existed. There were parts of that field that were not, at that time, proven. As a matter of fact, they were considered pretty much wildcat in nature.

Mr. Littman: You are speaking of the year 1936, Mr. Creveling?

The Witness: That is correct, and immediately thereafter.

We were able to encourage, through purchase contracts, at prices delivered into our main gas transmission system in the field, potential reserves, and by that I mean reserves if development disclosed the fact that they existed under

the particular acreage, of gas under purchase contracts that we considered very favorable and which, in addition to that, would prove our own acreage in the general vicinity covered under these purchase contracts.

[fol. 1597] By Mr. Culton:

Q. In other words, the drilling on those gas contract acres would help to prove the existence of gas under your own leases in the area?

A. That is exactly the case, and I refer principally now to the north end of the Hugoton field, principally Grant County, in which county under three contracts, we had the call on any gas reserves discovered under a minimum of 30 sections of land and a maximum of 90.

Q. Did you adopt any policy with respect to the closeness of wells, the spaces between wells or the acreage surrounding wells?

A. Very definitely, yes.

Q. What was that policy?

A. We were very definitely of the opinion that economic development and production of gas in fields such as the Amarillo and Hugoton areas could not be carried out with more than one well per section of land.

We therefore, adopted that as a company policy, that we would not enter into a purchase contract where one well did not hold at least 640 acres. Neither would we drill a well where we had not been able to unitize a block into one of at least 640 acres.

Q. Why didn't you drill all of these tracts immediately upon acquiring them?

[fol. 1598] A. Because of the economics involved, which economics, of course, in its last analysis, goes finally to the public. To carry a section of land under lease would probably cost at an average, $320 per year.

Q. As delay rental?

A. As delay rental, which, of course, would be an expense item. To drill one well on that section and connect it to our main transmission lines would cost an average of possibly $25,000. It is our belief that it is more uneconomic to pay a delay rental of—

Q. (Interposing) More economic or uneconomic?

A. (Continuing)—$320 a year, rather than have $25,000 additional investment substantially in advance of

when the production or the reserve rather, developed through that investment would be necessary to adequately serve our markets.

Q. You used the words, "more uneconomic." You meant, "more economic", did you not?

A. That is correct.

Q. You just misspoke the words.

Why not wait until you need that gas before acquiring the lease?

A. That would be a very fine situation, if it could be done, but competitive situations have been, and are now, such that, in that field, you could not acquire on as favorable a basis, currently, leases for development as you could [fol. 1599] at the time these leases were acquired.

Q. In other words, other companies are buying leases and producing from the same reservoir?

A. That is correct, and other lines are being talked about and projected out of the area, none of which, I hope, are built.

Q. Is there any way by which you can prevent their construction?

A. By no way that I know of, unless we come to the Federal Power Commission and represent they are about to compete with our markets and have them agree with us.

Q. Mr. Creveling, has the company adopted any, I suppose we should call it "new order" in the business of producing wells?

A. We have possibly developed something that could easily be so classified. By that, I refer to the acidization of wells.

About the time I came with the company, while acidization had been in practice in connection with oil fields in certain areas, it had not been developed in connection with gas fields.

In these two fields, the porous space in a producing horizon is partially filled with lime which, of course, cuts down the number of openings through which gas may come into the well bore, restricting the rate of flow from the wells.

As I said, acidization was in a very embryonic state, so [fol. 1600] far as natural gas wells were concerned. A

few wells had been acidized with approximately 1,000 gallons with some improvement but probably not enough to justify it unless there was something more that could be done.

We have developed this process further—I say "we", we developed it in cooperation with two companies who had had considerable experience in acidization of oil wells—to the point where we have now acidized some 54 of our wells and have increased the original open flow from slightly over 200 million to over 750 million.

Now, I want to be understood on that. We have not increased the reserve under that acreage by that process, but we have developed a more economic method of removing that reserve from its underground home.

Q. Why is it more economic?

A. Because of the fact that the original cost of a well in those areas might reasonably be taken at $20,000. It costs from $1,200 to $1,500, possibly an average of $1,400, to completely acidize a well with possibly a thousand gallons of diluted hydrochloric acid.

Q. A thousand or ten thousand gallons?

A. Ten thousand gallons. Did I say a thousand?

Q. Yes.

A. Ten thousand gallons of hydrochloric acid.

Q. The old method was a thousand?

[fol. 1601] A. The old method was about a thousand.

You can readily see, if it is profitable to spend $20,000 on the original well cost, obtaining a certain open flow thereby, it most certainly is within the limits of good economy to spend another $1,400 to increase that open flow by more than 200 percent.

This also goes beyond the original open flow of the wells in that it materially reduces the cost of taking care of those wells. There is practically no cleaning out work to be done on a well that is acidized as soon as it is drilled and it is our policy now to acidize the wells as we drill them.

Q. Since you have been with the company, has it adopted any policy with respect to consolidations and exchanges of leases?

A. We have. As I indicated to you, we do not drill a well on a tract that does not, in consolidation with other tracts, total at least 640 acres. Many of the leases in those areas, of course, are not 640 acres in size. We have, therefore, through trades with other companies, consolidations of various sorts and, through the acquisition of other tracts, consolidated before starting the drilling of a well, and do not start it until the consolidation is completed.

Q. Mr. Creveling, in your judgment, is your present reserve adequate for the markets which the company now anticipates?

[fol. 1602] A. If that question had been asked me a year ago, I would have been inclined to say yes. In view of the demands, however, being presently put upon us, the growth of those demands being much more rapid than we had previously estimated them, it is my judgment that we could well add to our acreage in favorable locations from time to time and our land and lease department, in cooperation with our geological department, is carrying out such a program on a modest scale at this time.

Q. Passing now to consideration of the transmission facilities of the company, what was the extent of the line which existed when you came with the company in 1936?

A. It had two main gathering lines, into the Liberal Compressor Station.

Q. One from the Panhandle field and one from the Hugoton field?

A. One from the Panhandle field and one from the Hugoton area and, from that point, had a transmission line of 24, 22 and 20 inch pipe diameter, running in a generally northeasterly direction, as has already been described in detail in this case, to a point on the Indiana-Illinois State line near Dana. It had installed, at that time, three compressor stations having a total installed horsepower of 14,000.

Q. What was the sales capacity of the line at that time?

A. The sales capacity of the line at that time was approximately 80 million cubic feet per day.

[fol. 1603] Q. Did you know anything definite as to the condition of the line?

A. I had some general thoughts about the line that caused me to feel that certain checks should be made to determine the exact quality of our transmission facilities

before our load built up to a point where they would be worked substantially to their capacity.

Q. What steps did you take to ascertain the condition of the line?

A. In acquainting myself with the affairs of the corporation, from time to time I went over the construction contracts and specifications for the original line. I found also that there had been used in the construction of this line, many different makes of pipe, all the way from lap weld to electric weld and seamless.

I knew that this pipe was acquired at a time when the demands on the pipe mills of the country were at a peak and that the line had been procured from various mills in any amounts that those mills could furnish above their other sales.

I was not certain as to the quality of this line and, in order to satisfy myself, I employed Mr. P. McDonald Biddison, whom I had known for many years, and with whom I had been associated for a part of that time and who had a reputation as one of the best natural gas engineers in the country, to make a valuation and appraisal of this [fol. 1604] entire system for me. This was done late in 1937 and completed in 1938.

* * * * * * * * *

Q. He was not a regular employee of the company, was he?

A. No, he was an outside consulting engineer.

Q. Did Mr. Biddison make a report to you, a copy of which has been offered in evidence? A. He did.

Q. Did you ascertain, when you came with the company, that there was a restriction in some portion of the line?

A. When I came with the company, one of the first things the operating men told me was the fact that the apparent capacity of the west end of the system was below that which it should be by the application of the then usually accepted flow formula.

This had not been previously an important item because of the fact that there was adequate capacity for the then existing markets in spite of these restrictions.

However, I put two engineers on the job of finding out what this was, because we were in the process of connecting other large markets, and we were approaching the point when we would need the maximum reasonable capacity of the line, with the result that the type of restriction was discovered and removed, thereby increasing the flow efficiency of those sections of the line from the low seventies to the low nineties (in percentage).

[fol. 1605] Mr. Littman: When did that occur, Mr. Creveling?

The Witness: That occurred in 1938.

By Mr. Culton:

Q. What was found to be the restriction?

A. There was a very thin scum formed on the inside walls of the line that I could describe, in lay language, as resembling, in general appearance, the roughness of sandpaper. The binder holding this sand in position apparently had come from a mineral seal oil from our gasoline plant and, possibly, some lubricating oil that had come through the compressors.

Q. How was that substance removed?

A. It was removed by running through the line, a section at a time, and by that I mean between gate valves—we have a gate valve on our main line about every eight miles—a device developed by our engineers on which a patent has been obtained.

Q. Was that the "go-devil" that has been referred to?

A. Yes, commonly called the "go-devil."

. . . . . .

Q. (Interposing) In a practical manner, what happened?

A. This go-devil is designed so that, by the pressure of the gas back of it, it is moved through the line in a rotary motion. It has on it wire brushes which, if you please, loosen up the material on the inside walls of the line, and it is so designed that the coneentric ring between [fol. 1606] the back part of the go-devil and the inside wall of the pipe can be varied to such an extent that enough gas will pass ahead of the go-devil to carry with it the loosened particles.

Q. During the period about which you have been talking, was there any pressure test made of the line?

A. There was. As I indicated, upon reading the contracts covering the original construction of the line and the specifications for material, I found that although the generally accepted maximum working pressure of the line was 450 pounds, these contracts and specifications indicated the fact that we probably had a line that could be safely worked at 500 pounds maximum working pressure.

To establish the reasonableness or unreasonableness of that position, during the year 1938, when our demands were not building up so rapidly, we tested our entire line, section by section.

* * * * * * *

To a pressure of 550 pounds, which pressure we figured would be sufficiently high to permit of a working pressure of 500 pounds maximum, provided those tests were, in our judgment, satisfactory.

Q. What was the result of the test?

A. Out of over 150,000 joints of pipe, we had 7 leaky joints, of which only three were complete failures, and out of some 85,000 couplers used on this line, we had only 3 failures, a performance that I, in my judgment, think [fol. 1607] would not be excelled by a line built today giving full consideration to any advances in the art of manufacture or construction from the date this line was laid to the present time.

Q. I assume that these bad joints and bad couplers were replaced?

A. They were removed, replaced with other material of the same size, and the line was again tested to 550 pounds.

Q. Has it been operated at a 500-pound pressure at numerous times since then? A. It has.

Q. During this same period, did you make any discovery with reference to anything else relating to the flow capacity of the line?

A. Yes, in cleaning out the line and making the tests of flow capacity before and after, we found a performance that we had felt certain existed, that is, that the flow capacity of large pipe lines under normal conditions was somewhat in excess of that indicated by the use of the

then generally used flow formula known as the Weymouth Formula.

We found, by actual experience and tests, that lines of this size, especially this line, perform more nearly in accordance with the flow formula in which Nikaradse's friction factor was used.

[fol. 1608] Q. From the standpoint of efficiency, what was the result of your discovery that the line would stand 500 pounds operating pressure and that this new formula was applicable?

A. Of course, we did not buy any additional capacity by developing the fact that the formula we had previously used in figuring capacity was too low or gave us too low a capacity.

However, it did give us some assurance of our ability to deliver an additional amount of gas than that we had previously considered possible.

With the raising of the pressure from 450 to 500 pounds, the tests and repairs resulting from which cost us approximately $50,000, we did buy a material increase in capacity. The total of those two items was approximately 30 million cubic feet, of which some 9 or 10 million was due to the formula and at least 20 million to the raising of the maximum pressure from 450 to 500 pounds.

In other words, we furnished, for the use of our customers, 20 million of additional capacity for $50,000 when, up to that day, capacity per million had cost possibly $250,000 or, saying it another way, for $50,000 we established a capacity that to have laid additional pipe lines working at 450 pounds, would have cost us between 4 and 5 million dollars.

[fol. 1609] Q. Has there been much of a turn-over in the employees of the company?

A. There has been practically no turn-over. As a matter of fact, possibly it has been even too small.

Q. In other words, practically all of the employees have been with the company a number of years?

A. That is correct.

Q. What construction was in progress when you came with the company in 1936?

A. The Detroit City Gas Company contract had been negotiated and executed prior to the time I came with the company. Construction work—

Q. (Interposing) Right there, did that contract require greater capacity than the 80 million cubic feet daily which the line at that time had?

A. The Detroit contract is a requirement contract by one of the terms of which our maximum obligation, as the [fol. 1610] original contract existed, was 90 million cubic feet per day.

As I was about to say, this Detroit contract was about to become operative and construction work, looking toward the delivery of gas to the Detroit area, was in progress. So far as the Panhandle Eastern Pipe Line Company is concerned, it was adding to its transmission facilities 8 additional compressor stations which stations had an installed horsepower of 29,300.

* * * * * * *

Q. All right. Was there any pipe line construction going on at that time?

A. At that time, as I recall it, Panhandle Eastern Pipe Line Company was not making any addition to its main pipe line system.

Q. What increase in the capacity of the line was effected by the construction of these compressor stations to which you have referred?

A. I would like to call your attention to the fact that in quoting capacities now, I am quoting prior to 1938, when work was done to increase the pressure and also when we, in estimating our capacities, gave proper credit to the flow formula.

Q. In other words, you are talking about the construction in 1936 and 1937?

A. That is correct. This work in 1936 increased the sales capacity of our system from 80 million to approx- [fol. 1611] imately 125 million cubic feet per day.

Q. This increase resulted solely from the addition of compressor stations? A. That is correct.

Q. What work, if any, was done in 1938? Was any construction of pipe line done in 1937? A. Yes.

The first delivery of natural gas under the Detroit contract was made July 7, 1936. The change-over from manufactured to natural gas was completed in December of the same year. The effective date, therefore, of the contract by one of its terms was January 1, 1937.

We had, in 1936, built capacity that we felt would be sufficient to carry all of our market requirements, including that of the Detroit area, for the winter of 1936.

We had not, however, built sufficient capacity to place us in a position to fulfill our maximum obligations under the Detroit contract, if we should be called upon to do so.

Therefore, in 1937, we did additional construction work along two lines. We further increased the installed horsepower in our various compressor stations by 29,400, and also started the looping of our main line; by looping I mean started the paralleling of the original line with another line, during that year laying approximately 270 miles [fol. 1612] of main line loops.

Q. What resulting capacity did you have after that work was completed?

A. This gave us an estimated resulting capacity of approximately 170 million cubic feet. Now, it was immediately after this, or in 1938, during which year we made these tests, because we could see, near the end of 1937, that we were going into a general industrial recession, if you please, and that increases in market requirements would not be as rapid as they had been, that we did the work, which work resulted in increasing our estimated capacity of our pipe line by 30 million or raising it from 170 to 200 million.

Q. As a result of that discovery, did you need to do any additional construction work in 1938?

A. We not only were not required to do any additional construction work in 1938 but, at the beginning of 1939, it did not appear that any would be necessary.

I would like to call your attention to the fact, however, that only about a third of this additional capacity could be classified under what you called "discovery." The other

was the result of actually improving the condition of the facilities as they then existed.

Q. What changes were found necessary, what increases were found necessary in 1939?

A. As we progressed into 1939, the Detroit City Gas [fol. 1613] Company indicated a probable maximum day the coming winter of 100 million, where the maximum under our contract as it then existed, was 90 million.

We immediately instituted a construction program to take care of this, as well as other apparent increases in demands due to the general improvement of business in the year 1939, which improvements probably were the forerunners of what we call our defense program.

Before that construction work was completed, it was apparent that the Detroit City Gas Company would probably require more capacity than the 100 million, indicating and requesting us to be able to serve that varying requirement up to 125 million.

We, therefore, if you please, superimposed another construction program on the one then in progress, which would place us in a position to deliver to the Detroit area 125 million cubic feet per day.

Q. And how much pipe line construction was carried on during that year as a result of those two programs?

A. As I recall it, there was approximately 250 more miles of main line looping done; and certain additions to compressor stations.

Q. Do you recall what those additions were?

A. We put in two small units, one at Tuscola and one unit at Greensburg, 1200 horsepower is my remembrance.

* * * * * * * *

[fol. 1614] Q. Mr. Creveling, before recess, I believe we were discussing the construction program by the company carried on in the year 1939.

A. 1939, and the early part of 1940, it ran over.

Q. Upon the conclusion of that program, what was the sales capacity of the line?

A. The sales capacity was increased from 200 to 250 million cubic feet per day.

Q. In our references to capacity at various times, you have been referring to sales capacity at all times?

A. I only talk about that capacity which we can convert into dollars, which is sales capacity.

Q. Yes. You have referred to the circumstance that the Detroit market was increasing from time to time. Have you had similar increases in other markets than Detroit?

A. I believe I indicated that in the statement to the effect that in 1939, not only were we requested for an increase in capacity dedicated to Detroit markets, but also our markets in general were increasing and at possibly as rapid a rate.

Q. Has the company carried on any construction since this work which was completed in the early part of 1940 up [fol. 1615] to recently, or is the sales capacity now the same as it was at that time?

A. 250 million cubic feet sales capacity as of the completion of the work of 1940 is the present sales capacity of our system.

Q. If the load during the winter of 1941 and 1942 is to be that which you are now estimating, will you be able to carry the peaks without additional construction?

A. We hope and expect to be able to carry all peaks created by our firm customers, but shall not be able to carry the total requirements of all customers attached to our lines at the present time.

Q. Do you recall what your cushion was on the peak day last year?

A. Our peak day's sales during the past winter were approximately 242 million cubic feet with a sales capacity of 250 million cubic feet.

Q. Has there been anything which prevented you from being ready to carry the peaks this winter? A. Yes.

Q. What is that?

A. We had under contemplation and had designed and put into operation, a construction budget, or a construction project which would have enabled us to, in our opinion, meet the coming winter's peaks substantially in their entirety, had we been able to obtain material soon enough

[fol. 1616] so that the construction work could have been completed before the time of those peak requirements.

However, although we applied for priority rating in May in order to obtain this material, primarily steel for pipe lines and in an amount of about 57,000 tons, we only, within the past ten days, have obtained a priority rating that, in our judgment, and the judgment of the steel mills, will give us this pipe.

We expect to obtain deliveries starting in November, possibly the middle or, shortly thereafter, and running at the rate of from 18 to possibly as high as 30 or 35 miles a week thereafter, until all of the material has been made and delivered, and we expect to carry out the construction program as rapidly as material is received and weather conditions will permit.

Q. Mr. Creveling, is it your judgment that any excessive load being put on the line now or in the future or, rather, any of the increases in the demand are the result of the defense situation?

A. That was very definitely demonstrated in our discussion of that very problem with distributors to whom we sell gas wholesale and through them, with industries served by them with our gas.

Q. Where are those industries located?

A. They are located in Missouri, Illinois, Indiana and [fol. 1617] Michigan.

Q. Do you think that there is any substantial portion of the increase which results from that? A. Yes.

Q. You have stated that you have a planned program which you hope to have completed sometime during the winter. Will that construction program take care of the necessities of the company's markets as you anticipate them to be during the winter of 1942 and 1943, taking into effect additional demands arising under the defense program?

A. It is our studied judgment that the construction program now in progress will fall short of taking care of the requirements of the winter of 1942 and 1943 and we are already discussing, in preliminary form, the amount of additional construction work that will be necessary in 1942 in order to meet those requirements.

Q. The additional demands put upon the line by reason of the defense program, will those demands be permanent demands or temporary?

. . . . . .

[fol. 1618] The Witness: Undoubtedly and indisputably, any temporary demands built up by industry which, by its very nature, is temporary, will not be lasting.

Q. Do you expect to attempt to build to take care of those requirements even though they be temporary?

A. We expect to build to take care of all of our implied obligations to the public to the extent that they appear to be within the realm of economic feasibility.

Q. What additional markets does the company now have in mind supplying over and above which it already now supplies?

A. Our present construction program will provide the immediate facilities of sufficient capacity to serve Flint, Pontiac, Kalamazoo, Battle Creek, Jackson, and some 80 other smaller communities in what is called the southern peninsula of Michigan and will be of such design that additions can be made as the market requirements increase and as the local supply of gas in the State of Michigan decreases to eventually supply substantially all of the market requirements of the southern peninsula of Michigan.

Trial Examiner: Just a moment at that point. Do the plans for new construction which you have just described exceed the estimate of outlay for 1943 as shown in Exhibit 47?

. . . . . .

[fol. 1619] The Witness: They do not.

Mr. Culton: The plans which you have referred to are those which Mr. Burnham has explained in his exhibit?

Trial Examiner: Involving a prospective outlay of approximately $6,000,000?

The Witness: That is substantially correct, yes, sir.

By Mr. Culton:

Q. That is for the transmission lines without including the field lines?

A. That is substantially correct for our main transmission system.

* * * * * * * *

Q. Do you plan to have your increases in main line sales capacity so as to take care of the additional demands from the new areas to be served in Michigan?

A. It is our plan to increase our main line sales capacity at a rate which will enable us to meet the increasing market requirements of all of our present and potential customers.

Q. There was a question asked by the Examiner and the record may not be clear on it. He inquired particularly with respect to the 1942 expenditures. There will [fol. 1620] be some 1941 expenditures carried over into 1942 now?

A. That is right.

Q. Because of your delay in getting your priority orders?

A. That is correct. My answer was intended to indicate that this indicated 1942 expenditure would be superimposed upon that now in progress.

Q. Yes, even though this now in progress, as originally planned; will not be completed until 1942?

A. That is right.

Q. Have you examined, and are you familiar with, the estimates made by Mr. Morton of the demands which this company will be called upon to meet for the years 1941 to 1946? I believe it was Exhibit 40.

A. I have examined and, as a matter of fact, gone over those very critically with Mr. Morton when they were in the process of preparation.

Q. Do you adopt them as your own? A. I do.

Q. Why?

A. Because of the fact that Mr. Morton has been doing this type of work as a part of his regular duties for the corporation ever since I have been with the company. I have made it a practice to discuss with Mr. Morton all of his major estimates that appear in our annual budgets from year to year, and to check performance against prediction and have found that performance to be such that [fol. 1621] I have the utmost confidence in Mr. Morton's ability to make such estimates.

I have also, in my past connections, had eighteen years of experience along just such lines of work, and believe I am qualified to pass reasonably accurate judgment on such items.

Q. Are you familiar with Mr. Hinton's estimate of the estimated capital expenditures in the field, both on the basic load and on the anticipated load? I believe that is Exhibit 43, Schedules 1 and 2.

A. I am familiar in some detail with Mr. Hinton's estimate on the field end, having discussed those in considerable detail with him at the time of their preparation.

Q. Are you also familiar with his estimates of future operating and maintenance expense, both on the basic load and on the anticipated load and I believe that is in Schedules 3 and 4 of Exhibits 43.

A. I am also familiar with those.

Q. Are you familiar with Mr. Burnham's exhibit as to the future capital expenditures on the main line? I believe that is Exhibit 47.

A. I am familiar with that, also.

Q. Do you approve the estimates of Mr. Hinton and Mr. Burnham in these exhibits?

A. I most certainly do.

Q. There has been introduced here an exhibit by Mr. [fol. 1622] Watkins showing certain increasing costs of Panhandle Eastern Pipe Line Company. Are you familiar with that exhibit?

A. I am.

Q. In your judgment, does it reflect the increasing costs which this company is now having to pay for similar labor and material over the prices heretofore existing?

A. It most certainly reflects the proper trend in such costs.

Trial Examiner: Are you referring to proposed Exhibit No. 73?

Mr. Culton: Yes, sir.

By Mr. Culton:

Q. What do you mean by "the proper trend"?

A. By proper trend, I mean it reflects an upward trend. I am not at all certain that the rate of that upward trend, as indicated by this chart, is as rapid as it will be in the immediate future.

Q. When you came with Panhandle Eastern Pipe Line Company in 1936, what was the character of its financial structure?

A. Briefly, it had outstanding in private hands approximately 18 million par value 6 percent first mortgage and first lien bonds; 100,000 shares of $100 par value 6 percent cumulative and participating preferred stock class A callable at 100 to 110, changing from one to the other at a certain date; and 10,000 shares $100 par value 6 percent class B preferred stock, non-callable, and carrying [fol. 1623] the right as a class to elect two directors to the corporation; and some 728,000 shares of common stock having an estimated value of $25 per share.

Q. Had any dividends been paid on the stock at that time? A. No dividends had been paid up to that date.

Q. Did you have occasion shortly after you came with the company to make any change in that capital structure?

A. It was quite apparent to me, as I got my feet on the ground and looked around for something that I might contribute that had not already been done, that in view of the change in money rates, there was a possibility of refunding the outstanding 6 percent bonds.

With that thought in mind, we started to work with the result that, early in 1937, those bonds were called with a part of the proceeds of a new issue of 4 percent first-mortgage and first lien 15-year bonds.

The amount of that issue was, as I recall it, [was] $24,000,000. The difference in the net proceeds between the total issue and what was required to call the outstanding issue of 6-percent bonds, in an amount, as I recall it, of some four or five million dollars, was applied to the construction work of 1937.

Q. Since you have been with the company, has there been any change in the amount of common stock outstanding?

[fol. 1624] A. Yes. In 1939, 80,000 shares of common stock was offered through rights to the stock holders of Missouri-Kansas Pipe Line Company, and substantially the entire amount was taken.

Q. At what price? A. At $25 per share.

Q. Since that time, has there been any other change in the capital structure? A. Yes.

Q. What was it?

A. Money markets plus the fact that we, at this time, had behind us some earnings record, some indication as to the stability of our business and had established certain credits in the general financial markets by our performance, enabled us to believe that the then outstanding 4 percent first mortgage and first lien bonds could be refunded on a basis more favorable than the existing one.

Q. Were you able to do that?

A. We consummated such a refunding deal early this year, as of November, 1940.

Q. What was the basis of that?

A. This deal consisted of $5,000,000 unsecured serial notes maturing at the rate of $1,250,000 per year from the second to the sixth year; $6,250,000 par value of mortgage notes maturing serially at the rate of $1,250,000 a year from the sixth through the tenth year and twelve million par value of 3 percent first mortgage and first lien [fol. 1625] 20-year bonds on which the sinking fund, beginning in the 11th year, in an amount of $1,200,000 per year, was sufficient to retire the entire issue at its maturity twenty years after the issue date.

Q. What was the necessity for the payment annually of certain sums and the provision of a sinking fund maturing the entire obligation in twenty years?

A. This corporation is engaged in the production, transmission and sale of a wasting asset. The management itself considers it good business to pay its debts before the commodity on which it must earn moneys with which to meet those debts has been exhausted.

Also, it is a requirement of that part of the public to whom we go for capital of this type to require that type of security.

Q. In other words, it is necessary to maintain the credit of the company? A. Yes, sir.

Q. The obligations must be paid before the gas is gone? A. I believe I so stated.

It might be interesting, in passing, to say that the average over-all cost of money during this last refunding proposition resulted in an average rate slightly below 2¾ percent.

Q. Mr. Creveling, is all of the money which the company has invested in additional facilities since 1936 rep-
[fol. 1626] resented in the increase in the outstanding bonds and stocks?

A. It is not. When I came with the company, we had outstanding approximately $18,000,000 par value of first mortgage and first lien bonds. We now have outstanding comparable debt of approximately $23,000,000. We have outstanding, let us say, substantially 160,000 shares of common stock at $25 per share or substantially $4,000,000 as the proceeds from that.

In that time, we have increased our plant account by substantially $22,000,000, as I recall it.

Q. These amounts you have given for debt and common stock are in excess of that formerly existing?

A. That is correct. In other words, I am trying to answer your question as I understood it.

Q. Yes, and what has been the increase in construction? A. I would say in excess of $22,000,000.

Q. Where has the rest of the money come from?

A. It has come out of the till.

Q. Is it going to be necessary for Panhandle Eastern Pipe Line Company, in the future, to go to the public for additional financing?

A. I anticipate that undoubtedly it will be.

Q. For what purpose?

A. For the purpose of further developing our properties to the economic limits largely determined by the requirements of our present and prospective markets.

[fol. 1627] Q. Are there any risks of a natural gas pipe line company and, particularly, of Panhandle Eastern Pipe Line Company, not shared by other types of businesses?

A. Of course, all types of business involve certain risks. There are certain risks peculiar to companies such as the Panhandle Eastern Pipe Line Company of varying degrees for different companies.

Those risks might be roughly classified under those incident to exploration or mining hazards which, I think, are generally understood, the production risks after the raw material has been discovered, if you please, such

risks as are involved in taking care of wells in different fields; no two wells require the same treatment and, as a matter of fact, quite frequently different wells in the same field require different treatment in order to produce the ultimate economic limit from those wells. We have salting conditions. That is now appearing in certain areas in the Amarillo field. We have water hazards and freeze-ups. The change in the quality of the gas which might become of some importance, especially in the Amarillo field, due to the fact that in the same general horizon in different parts of the field there are both sweet and sour gas or commercial and uncommercial gas.

By sweet gas, I mean gas that does not contain sulphur content in any appreciable amount and, conversely, by sour gas, I mean gas that does contain sulphur content [fol. 1628] in some appreciable amount. There might be some other risks named in the production—

Q. (Interposing) Is there any competitive risk?

A. Yes, from the standpoint of drainage, that is probably the largest single risk in the field from which we obtain our supply of natural gas.

Q. How does that risk come about?

A. It was partly in order to minimize this risk that we have adopted and pursued our policy either through purchase contracts or through acquisition and reallocation of acreage to so block our acreage that that drainage, if any, will be reduced to a minimum.

Q. How does that drainage come about?

A. It comes about by someone drilling a well offsetting a lease that you have, and taking from that well gas at such a rate that the underground movement of the gas will be from your lease to his lease.

Q. What risk does the company face from the standpoint of its transmission facilities?

A. In the field end of this company's transmission system, and by that I mean with its gathering lines, there is some considerable risk because of the character of the terrain. Certain parts of it are badly eroded, it cuts and washes very easily during heavy rains, and there are many of them, so that we are constantly faced with the proposition of having field lines uncovered and some of [fol. 1629] them go out, have to be replaced, and it

might be sufficient in size to materially lower the current amount of gas available for our markets, if it were not for the fact that we have three main field lines, two of which come out of the Hugoton area and one out of the Amarillo area and the risk of this type of field line failure is not nearly so great in the Hugoton field as it is in the Amarillo field, plus the fact that we have in storage, from fields to our markets, several hundred millions of cubic feet of gas sufficient in quantity to enable us to make any reasonable repairs or replacements without any hazard to continuity of service.

Now, on the main lines in general—

Q. (Interposing) Right there, that is merely a hazard of the company having to spend an unusual amount for repairs, rather than a real hazard from loss of service?

A. I would say the hazard of loss of service is very, very small.

Q. Where is the line pack with respect to the field?

A. The line pack is all between the field and the market.

Q. Therefore, a washout could not affect the line pack?

A. That is correct in the field lines. Now, on our main transmission facilities, while there is some risk there, the character of the country through which our main transmission lines run is such that we have very little chance of a line going out due to high waters or for any other [fol. 1630] reason that normally we might expect to occur.

We have taken care of our main line river crossings by having multiple crossings. The Mississippi River, for instance, has both an overhead crossing and a crossing under the bed of the stream. We also have, at the present time, 70 percent of our main line looped and, with the construction work now in progress, that will be increased to 85 percent and if we carry out our presently anticipated additional program for 1942, our entire main line will be completely looped, being, so far as I know, the first completely looped long natural gas transmission system in the country.

Q. When that is done, what have you to say as to the practical probability of any interruption of service, whether there is a hazard in that respect?

A. It is entirely a matter of degree of hazard. It would be foolish for me to say that there is no possibility of an interruption of service.

However, it is my very definite judgment that the practical hazard of such an interruption of service is reduced to a point where it is negligible.

Q. Can you give an illustration of that?

A. Yes, I think I can give an illustration of that by stating what happened within the past month and about which our customers knew nothing unless they read an account of the happening in some of the papers.

[fol. 1631] Some workmen were digging a hole to bury a dead man as an anchor for an electric pole line at a point about a mile and a half west of Mexico, Missouri. In digging this hole, the workmen struck a dark-colored hard material which did not respond easily, and most workmen digging holes for pole lines expect the terrain to respond easily to the ordinary working tools, so they placed a charge of dynamite on this dark material and set it off, with the result that one of our pipe line systems was blown up; destroying about 300 feet of a newly constructed main highway nearby; completely interrupting Western Union service, about an 80-wire system, putting out of commission the main lines of two railroads, and seriously burning three men but, in passing, I am glad to say all of those men are recovering.

This happened at four-thirty in the afternoon. At twelve o'clock that night, in spite of this very severe fire, the line was ready to go back in service and, due to the fact that we had a two-line system, I do not believe that any of our markets were aware of the happening unless they read news items copied from the Mexico, Missouri, paper.

Q. In other words, you had a double line at that point and the other line was able to give service until the repair was made? A. That is correct.

Q. And where is that point located with respect to the line as a whole? Is it near the center or on one side, or how

[fol. 1632] does the distance from the point to the east end and the west end of the line compare?

. . . . . .

A. It took place just west of Mexico, Missouri, and it is in the area really where our market requirements start to be substantial and I should say substantially halfway on our main line system.

Q. Do you consider that use of the loop line system as being a substantial protection to the public against interruptions of service?

A. Most definitely, yes.

. . . . . .

[fol. 1633] Q. You have been discussing the transmission facility risks. I believe you stated there are some commercial risks?

A. Yes, there are some commercial risks that, to me, are much more likely of realization than these previous risks which we probably should classify as physical risks.

On the commercial risks, I have in mind, briefly, these and I am not endeavoring to mention all of them and possibly not in the order of their importance but in the order they come to me.

One is the risk of confiscatory taxes. By confiscatory taxes, I do not mean those taxes that are levied in the guise of excess profit taxes or normal taxes of that kind at all. Those are taxes that industry must bear and we do not cry about those taxes except to the extent that those taxes may be discriminatory, but I refer to taxes of this type: To the best of my knowledge and belief, there has not been a session of the Illinois State Legislature since I have been associated with this company at which there has not been introduced one or more bills, the purport of which is to tax every thousand cubic feet of natural gas sold within that State.

Those bills have proposed taxes ranging from five to as high as ten cents per thousand cubic feet and, of course, such a tax, if finally it were administered, would be com-
[fol. 1634] pletely confiscatory so far as our business in the State of Illinois is concerned.

Mr. Lee: Mr. Examiner, if you will pardon me—those in effect are not taxes are they?

Mr. Culton: He is talking about risks.

The Witness: This is a risk, Mr. Lee, that we face continually.

Mr. Lee: Such as strike bills that are introduced some time?

The Witness: I do not know whether they would be called that or not and I do not wish to indicate definitely who may be behind these taxes, but an implication might be gained from my next risk.

* * * * * * *

The Witness: (Interposing) There are in existence today no such confiscatory taxes, but there has not been a session of the legislature in Illinois in which an effort to pass such a bill has not been made.

By Mr. Culton:

Q. Your next commercial risk?

A. The next commercial risk would probably be that of competing fuels. Competing fuels is a real risk, probably from two main standpoints; one, that competing fuels are not subject to the same regulation that natural gas is sub- [fol. 1635] ject to. It is true that under the Natural Gas Act, as it now exists, direct sales to the industry are excluded.

However, a large part of our business is, in its last analysis, competitive and ceases to be competitive only to the extent that, for certain uses, it gets into the luxury class and our wholesale customers or distributors sell much gas to industries within the distribution centers.

It is not possible to vary the prices to such industries sufficiently rapidly to meet changing competitive prices.

For this particular company, competing fuels offer an additional risk because of the existence of such large quantities of competing fuels in the same general territory as that traversed and served by Panhandle Eastern Pipe Line Company.

By that, I refer to the coal situation in Missouri and Illinois and to the fuel-oil situation in the Chicago area and close enough to the Detroit area that we have found fuel-oil being sold in that area during the past two years for as low as two cents per gallon.

Another risk that we must give consideration to is that of other supplies of natural gas, economically closer to our principal markets than our present supply is, which sources of supply did not exist at the inception of this project.

* * * * * * *

They were not known to exist at that time, and which have developed or may develop at any time. As an example [fol. 1636] of the seriousness of this, there are held under commercial oil and gas leases at the present time in the State of Michigan approximately two million acres, in the State of Indiana approximately 1,300,000 acres, and in the State of Illinois, approximately 3,700,000 acres, or, in total, something like seven million acres that are presently, at the present time, being explored in the search of oil and gas.

Mr. Littman: Are those near your pipe lines, Mr. Creveling?

The Witness: They are near our pipe lines. As a matter of fact, the most recent activity in the acquisition of oil and gas leases in the State of Indiana is in the northwest part of the State.

Within the past probably two weeks in this exploratory work, there has been drilled in the State of Illinois at a point some 50 or 60 miles east of St. Louis and 70 to 75 miles from our pipe line, a gas well having an open flow of 17 million cubic feet, so that this is a real risk.

By Mr. Culton:

Q. How is that a risk, Mr. Creveling?

A. It is a risk because of what seems to me the very apparent fact that whenever natural gas is discovered in commercial quantities that can be offered to the public economically on a more favorable basis than we are delivering the same commodity to the same public, the public will be given the benefit of it in some way, either we will

[fol. 1637] lose all or a part of our market or we will be compelled to reduce our prices to a point that is competitive with this new supply.

. . . . . .

The Witness: Another risk that has recently arisen and one that no one had experienced previously is that risk indicated by Docket G-210.

By Mr. Culton:

Q. That is of this Commission?

A. Before this Commission, hearings on which were had last week. If the contentions made in this case—

Q. (Interposing) You mean in G-210?

A. —In G-210 are finally sustained, the immediate effect on the gross earnings of this company and by "immediate effect" I mean immediately upon putting into operation what is proposed, would be a reduction of the company's gross income in excess of $1,000,000.

. . . . . .

[fol. 1638] Q. Mr. Creveling, are you familiar with the study which was presented in connection with the testimony of Mr. Coffman in which he expressed, from the sources he had examined, his judgment as to the number of dollars this company would be required to receive if it properly served the public?

A. I am familiar with that. I went over that study in considerable detail with Mr. Coffman and with a great deal of interest.

. . . . . .

[fol. 1639] Q. What specific items can you refer to which, in your judgment, were not sufficiently covered by the testimony of Mr. Coffman?

A. Without appearing to criticize Mr. Coffman's findings, which I do not, in which he stated, so far as the item about which you are questioning me is concerned, that the figure given by him was an irreducible minimum, there are these items that Mr. Coffman was not in a position to know about and which would materially increase the number of dollars arrived at by Mr. Coffman as essential to the satisfactory economic conduct of this company's business.

Because of our increasing demands, we are going to be required, in the immediate future, to make larger expenditures in the field end of our business than had previously been our practice. During the next short time, that item will be at least $4,000,000—.

. . . . . .

[fol. 1640] By Mr. Culton:

Q. What additions do you think should be made to the [fol. 1641] estimates of Mr. Coffman in order to reflect matters for which the company needs additional money, over and above those referred to by Mr. Coffman?

. . . . . .

The Witness: One, an expenditure in the immediate future for additional development and field lines and other items connected therewith of approximately $4,000,000; the fact that while the over-all rate of amortization may be on a 25-year basis, a material part of our field investment, namely that in the Amarillo end, should, in my judgment, be amortized over a period of not to exceed 15 years, thereby requiring a larger sum for amortization the next few years.

. . . . . .

The Witness: Also, actual experience during the past year indicates that an estimated addition of an item of 10 percent on material and pay rolls is not sufficient. It is my judgment, from experience for 1941, and as borne out by our records, there should be at least $150,000 more per year added for this item. Those are the ones I think of, at this time.

By Mr. Culton:

[fol. 1642] Q. That is because of increased costs?

A. Certainly.

Q. Are there any other matters that he failed to take into consideration?

A. I do not recall any other in arriving at this figure, but there is one other matter that I think should be given consideration in a fair consideration of the problem before us, and that is this:

Because of the peculiar period through which we are now passing, we are experiencing an abnormally large increase in our gross business. That increase, in our judgment, is caused largely by the demand for fuel caused by the defense program and is one that we are being called on, to the best of our ability, to meet promptly when it arises. It is one that will not continue indefinitely and, therefore, should be given proper weight in arriving at a fair return for this company.

* * * * * * *

[fol. 1664] GEORGE S. YOUNG a witness called on behalf of Michigan Gas Transmission Corporation, being first duly sworn, was examined and testified as follows:

Direct Examination.

By Mr. Porritt:

* * * * * * *

[fol. 1665] Q. Where do you reside?

A. Detroit, Michigan.

* * * * * * *

I am Vice-President and also a Director of the Michigan Gas Transmission Corporation.

Q. Mr. Young, please state your education and experience.

A. I graduated from the United States Naval Academy in 1920. From then until 1925 I engaged in the performance of various duties, mostly of a technical nature, aboard various type of naval vessels.

In 1925, I entered Columbia University for postgraduate work in engineering, which work was completed in 1927, at which time I received a degree of Master of Science.

From 1927 to 1930, when I left the Navy, I performed engineering duties on a battleship.

In 1930, I entered the employment of the Columbia Engineering and Management Corporation, a subsidiary of the Columbia Gas & Electric Corporation. I continued in its employ until 1933.

In that year the Columbia Engineering Corporation, [fol. 1666] which was also a subsidiary of the Columbia Gas & Electric Corporation, was organized and replaced the Columbia Engineering & Management Corporation.

I continued in the employment of the Columbia Engineering Corporation until 1934. While in the employment of these corporations, I engaged chiefly in making engineering studies of natural gas projects and in the design, construction and operation of natural gas transmission facilities.

The Columbia Engineering Corporation was liquidated in 1934 and I was transferred to the United Fuel Gas Company at Charleston, West Virginia.

This company is also a subsidiary of the Columbia Gas & Electric Corporation, and while in its employ I was also engaged in making engineering studies of natural gas projects and in the design, construction and operation of natural gas transmission facilities.

I left the employment of the United Fuel Gas Company in 1936, when I was temporarily employed by the Panhandle Eastern Pipe Line Company at Kansas City, Missouri, to assist in the design and construction of compression stations which were built in that year between the Texas Panhandle Gas Field and the Illinois-Indiana State Line.

These stations were built to increase the capacity of Panhandle's transmission system to deliver gas to the Detroit market which had been acquired by the Panhandle Eastern Pipe Line Company.

[fol. 1667] Upon completion of my temporary employment by the Panhandle Eastern Pipe Line Company I was employed as General Manager of the Michigan Gas Transmission Corporation, a subsidiary of Columbia Gas & Electric Corporation. I established offices in Detroit on June 1, 1936, and except for a brief tour of duty in the Navy in 1941, I have been employed by Michigan Gas Transmission Corporation since that date.

I had some responsibility in connection with the construction of approximately 231 miles of 22-inch O. D. pipe

line and river crossings between Zionsville, Indiana, and Melvindale, Michigan. I have been responsible for the construction of all other additions to the Corporation's property, and for its operation. I have also personally conducted sales negotiations.

In 1938 and 1939, I was Chairman of the Transmission Committee of the Natural Gas Section of the American Gas Association.

Q. Mr. Young, have you been requested to prepare, or to have prepared, a general description of the physical properties of the Michigan Gas Transmission Corporation's transmission system?

A. Yes, a general description of the physical properties and also the source of supply and a brief description of the markets served with gas delivered from the system, all as of June 30, 1941.

[fol. 1668] Q. Has this description been reduced to writing? A. It has.

Q. Did you also prepare or have prepared schedules amplifying, in some detail, the general description of the Corporation's property?

A. Yes.

Q. Are these documents, a copy of which I have in my hand, the material to which you have just referred?

A. Yes, they are.

Q. Were these documents prepared under your direction and supervision? A. They were.

* * * * * * * * *

(The Document Referred To Was Marked Exhibit No. 77 For Identification.)

* * * * * * * * *

[fol. 1671] Mr. Lee: Mr. Witness, does your exhibit contain any statement with reference to the number of breakages of the pipe lines and the failure to supply at any time since the date of construction?

The Witness: Yes, on Page 15 of the exhibit, it refers to two pipe-line breaks, one of which occurred January 8, 1937, and one of which occurred on January 14, 1937.

Mr. Lee: Thank you for that information, and just one more question.

Does that comprehend all of the breakages or failures of the pipe line since its creation?

The Witness: Yes, since June 1, 1936, the time when I [fol. 1672] joined the company, it does.

By Mr. Porritt:

Q. Mr. Young, have you prepared or had prepared under your direction a map showing the pipe line system of the Michigan Gas Transmission Corporation?

A. Yes.

Mr. Montgomery: May I ask one question, Mr. Examiner?

. . . . . .

Mr. Montgomery: It is in relation to the question just asked by Mr. Lee.

Your answer to Mr. Lee's question refers only to the section of the pipe line owned by Michigan Gas Transmission Corporation, does it?

The Witness: That is correct, sir.

Mr. Montgomery: Do you know whether or not there have been breaks in other sections of the pipe line since you have been with the company?

The Witness: There have been no other breaks in the pipe line belonging to the Michigan Gas Transmission Corporation.

. . . . . .

[fol. 1673] Mr. Montgomery: I will ask you this and withdraw that question for a moment.

In your position with the Michigan Gas Transmission Corporation, if there were any other breaks in the line between the source of supply and Dana, Indiana, you would know about it, wouldn't you, necessarily?

The Witness: Yes. On one occasion I was advised there was such a break, and on only one.

Mr. Montgomery: And about what date was that?

The Witness: That happened to occur at the same time that the break occurred on January 8, 1937.

Mr. Lee: Has a break of any kind resulted in a failure of supply of gas to the Detroit market by your company, at any time?

The Witness: It resulted in a curtailment, but not a discontinuance.

* * * * * * * * *

By Mr. Porritt:

Q. Mr. Young, I show you a copy of a map of the Corporation's main line transmission system which is en- [fol. 1674] titled "Transmission Lines of Michigan Gas Transmission Corporation", and ask you if this is the map to which you have just referred?

A. It is.

* * * * * * * * *

Q. Mr. Young, was this map prepared under your direction and supervision?

A. It was.

Q. Is it your opinion that it correctly shows what it purports to show? A. It does.

* * * * * * * * *

(The Document Referred To Was Marked Exhibit No. 78 For Identification.)

* * * * * * * * *

Q. Mr. Young, have you prepared, or had prepared, a statement comparing the capacity provided by Michigan [fol. 1675] Gas Transmission Corporation for the delivery of firm gas with the maximum daily deliveries of firm gas from the system? A. I have.

Q. Is this document which I now show you entitled, "Comparison of Daily Provided Capacity to Deliver Firm Gas with Maximum Daily Delivery of Firm Gas from System of Michigan Gas Transmission Corporation", the statement to which you have just referred? A. It is.

* * * * * * * * *

(The Document Referred To Was Marked Exhibit No. 79 For Identification.)

By Mr. Porritt:

Q. Will you briefly outline the information set forth in this statement?

A. Under Column "A" are listed the distributing companies to whom Michigan Gas Transmission Corporation sells firm gas or to whom it delivers firm gas for the account of Panhandle Eastern Pipe Line Company.

Under Column "B" are shown the location of the points of delivery to the respective distributing companies.

Under Columns "C" to "L", inclusive, are shown the capacities provided for each customer beginning with the [fol. 1676] winter period of 1940-1941 as compared with the actual maximum delivery of firm gas to each distributing company. The dates on which the maximum deliveries occurred in each winter period are shown on Line 37 of the tabulation.

Deliveries to certain of the distributing companies are not metered daily and the maximum deliveries in each of these cases was estimated from the total deliveries for the week or month during which the date of maximum deliveries occurred.

. . . . . .

Q. Mr. Young, what have you to say concerning materials and supplies on hand as of June 30, 1941?

A. I consider that the quantities of materials and supplies on hand as of June 30, 1941, are the minima required for the operation and maintenance of the transmission facilities.

. . . . . .

[fol. 1677] Mr. Littman: Just one minute, Mr. Young.

Referring to Column "J" of Exhibit 79, is all of the gas shown in that column firm gas?

The Witness: Yes, sir.

Mr. Littman: Will you elaborate for us with respect to the figure of 9,035 in Line 42 with the footnote "B" and explain what that footnote means?

The Witness: The measurement to the Central Indiana Gas Company at the Muncie measurement includes the delivery of interruptible gas.

Normally, we do not get a report of the daily deliveries to interruptible customers which we can subtract from the total deliveries to determine the firm deliveries.

In this case, there was one delivery to one customer which we could not obtain and, as stated in the footnote, we estimated the daily delivery to that particular customer on January 18, 1941, the date on which the maximum delivery occurred.

Mr. Littman: Did you deduct the amount for that industrial?

The Witness: Yes.

Mr. Littman: So that none of the columns, "C" to "L", inclusive, contain any interruptible gas?

The Witness: That is correct, except I might mention in connection with this note "B" again, that, if our estimate of the amount delivered to that one customer on that [fol. 1678] one day was in error, then interruptible gas to the extent of our error might have been included.

* * * * * * * * *

Henry C. Lehn, a witness, called on behalf of Michigan Gas Transmission Corporation, being first duly sworn, was examined and testified as follows:

Direct Examination.

By Mr. Porritt:

Q. Mr. Lehn, will you please state your name, address, and present connection?

A. Henry C. Lehn, Buffalo, New York, Worthington Pump and Machinery Corporation.

Q. What is your present position with that company?

A. Consulting Engineer.

Q. State briefly your business experience, with particular reference to your experience with gas compressors.

A. Following several shop and drafting room engagements, in 1906 I entered the employ of the Snow Steam Pump Works, which is now the Buffalo Works of the [fol. 1679] Worthington Pump and Machinery Corporation, as draftsman.

From 1906 to 1911 I was engaged in detail gas engine drafting and later gas engine design. In 1911 I entered the Sales Engineering office of the plant where my work consisted of gas compressor and pipe line calculations and related general sales work, and also field work at gas compressor stations.

In 1918 I was made assistant chief engineer, and in 1923 Chief Engineer in charge of gas and Diesel engine design and field tests. I became Consulting Engineer in 1933, my present position, and devote special attention to pipe line compressors.

Since 1925 I have been in close contact with gas-pipe line and compressor activities, retaining direct supervision of pipe line and compressor design at the Buffalo plant.

Since 1925, the Worthington Pump and Machinery Corporation has installed the main compressor equipment in more than thirty compressor stations on the major pipe lines.

Some of these installations are on the following lines:

Interstate Natural Gas Company; Memphis Natural Gas Company; Mississippi River Fuel Corporation; Colorado Interstate; Natural Gas Pipe Line Company; Northern Natural Gas Company; Panhandle Eastern; Michigan Gas; Southern Natural Gas Company; and others.

In line of my duties on behalf of Worthington Pump in connection with these installations, I took part in general engineering discussions with the pipe line organizers and [fol. 1680] particularly for estimates of their power requirements from which I calculated the size of engines and compressors, and made recommendations to them.

I have inspected many of these stations during erection and after they were in service, noting their construction, operation and manner of maintenance. I am also familiar with this type of equipment and with its history almost from the beginning, and have had an opportunity to observe its behavior over long periods of service.

Q. Have you inspected the three compressor stations of Michigan Gas Transmission Corporation located near Montezuma, Zionsville and Edgerton, all in Indiana?

A. I have.

Q. I show you a document entitled "Report of Inspection by H. C. Lehn" of equipment in the compressor stations of the Michigan Gas Transmission Corporation, and ask you if this was prepared by you in the light of that inspection. A. It was.

* * * * * * *

(The document referred to was marked Exhibit No. 80 for identification.)

Q. Can you summarize briefly, Mr. Lehn, the nature of [fol. 1681] the inspection you made of these compressor stations?

A. While the nature of my inspection is set forth in more detail in my report which has been marked Exhibit 80 and identified, the general nature was this:

My company, Worthington Pump and Machinery Corporation, was asked to furnish an engineer for the inspection of these compressor stations to determine how much they had depreciated since their installation.

Because of my familiarity with this type of equipment, I was selected by my company to undertake this work. I did visit the stations and examined first, the external parts of the engines to determine whether there was any evidence of deterioration visible there, and then I carefully observed the operation of the engines. Then I examined the station records covering hours of operation, measurements of wear and maintenance work.

Q. Did you determine the amount of wear on cylinder liner and piston rod parts?

A. Yes, by observation of the station records.

Q. Was your examination sufficiently complete and detailed to enable you to form definite opinions of the present condition of these units? A. It was.

Q. What was your conclusion as to the percentage condition which you were able to determine as to each of these units?

A. On the main Edgerton Station—99 percent; Zionsville [fol. 1682] Station—97 per cent, and Montezuma Station—96 percent. On the remainder of the auxiliary equipment, which is of a different type, Edgerton Station—99

percent; Zionsville Station—96 percent, and Montezuma Station—95 percent.

. . . . . .

HOWARD S. RIDDLE, a witness, called on behalf of Michigan Gas Transmission Corporation, being first duly sworn, [fol. 1683] was examined and testified as follows:

. . . . . .

By Mr. Porritt:

. . . . . .

Q. Where do you reside? A. Columbus, Ohio.

. . . . . .

I am employed by the Columbia Engineering Corporation, a subsidiary of Columbia Gas & Electric Corporation.

. . . . . .

My present position is Electrolysis and Corrosion Engineer for the Columbia Engineering Corporation.

. . . . . .

My technical education was received at Ohio State University and the University of Florida where I graduated in 1924 with the degree of Bachelor of Mechanical Engineering.

From 1924 to 1925 I was employed by the Jeffrey Manufacturing Company of Columbus, Ohio, as Assistant Chemist in the Metallurgical Department under the direction of Dr. C. C. Clevenger. This work consisted of metallurgical analysis of cast iron, steel, metal alloys, as well as calorimeter determinations on oils.

In 1925 I left the Jeffrey Manufacturing Company, or- [fol. 1684] ganizing my own engineering and surveying company in the City of Clearwater, Florida, conducting general engineering and property surveys. This business was conducted for approximately one year which terminated in selling out to Mr. R. B. Moore of Indianapolis, Indiana.

In 1926, I was re-employed by the Jeffrey Manufacturing Company of Columbus, Ohio, in the Engineering Department, Crusher and Pulverizer Division, on design and layout work.

In the fall of 1927, I was employed by the Columbia Engineering and Management Corporation as Assistant Electrolysis and Corrosion Engineer. I continued in its employ until 1933. In that year Columbia Engineering Corporation, which was also a subsidiary of the Columbia Gas & Electric Corporation, was organized and replaced the Columbia Engineering and Management Corporation. I continued in the employment of the Columbia Engineering Corporation until 1934.

In 1934, Columbia Engineering Corporation was liquidated and I was transferred to the Ohio Fuel Gas Company at Columbus, Ohio, which company is also a subsidiary of Columbia Gas & Electric Corporation. In February, 1938, Columbia Engineering Corporation was reorganized and I was again transferred to this organization, where I am employed at the present time.

My work has consisted chiefly in conducting electrolysis surveys on both main pipe lines and distribution plants of the Columbia system, in talling subsequent mitigation [fol. 1685] measures for their future protection against electrolysis, conducting soil surveys prior to construction along the right-of-way of proposed underground pipe lines and also along the right-of-way of operating systems for the purpose of determining the necessity of installing or applying protection against corrosion. Supervision as to the proper application of coating materials where protection was to be applied, and the design of various coating and piping wrapping devices.

In this connection, corrosion research was conducted on a various assortment of coating materials in an effort to select a salient few most suited for economical pipe line application.

* * * * * * *

Q. You mention the conducting of soil surveys on various properties of the Columbia system. Was this ever done on the property of Michigan Gas Transmission Corporation? A. Yes.

Q. Please specify where these surveys were conducted.

A. A soil survey was conducted on 20" Line A from the [fol. 1686] Illinois-Indiana State line east to Zionsville and on 18" Line B from Zionsville, Indiana, east to King Measuring Station near Muncie, Indiana. A soil survey was also conducted on the 22" Line C from Zionsville, Indiana, to Detroit, Michigan.

Q. What method was used in making these soil surveys or, in general, what was the procedure?

A. The Columbia Soil Rod was used, an instrument devised and patented by the Columbia system for determining the relative corrosivity of soil in place and at pipe depth.

* * * * * * * *

[fol. 1687] Q. Did you find these soils where the surveys were conducted to be of a corrosive nature?

A. Yes, practically all soils are corrosive and, in this case, most of the soils are, in my judgment, sufficiently corrosive to justify the use of protective coating.

Q. Mr. Riddle, have you been requested to make a physical examination of the underground transmission pipe lines of the Michigan Gas Transmission Corporation?

A. I have.

Q. Have you prepared a written report on your examination of such pipe lines? A. I have.

Q. Is this your report, and does it contain the results of your physical examination and study conducted either by you, under your supervision, or in your presence and with your knowledge? A. It does.

Q. Does this report, in your opinion, correctly show what it purports to show? A. It does.

* * * * * * *

[fol. 1688] (The document referred to was marked Exhibit No. 81 for identification.)

Q. At how many locations during this survey was the pipe exposed for examination?

A. Thirty-seven excavations were made spaced approximately every ten miles, covering in all approximately 362 miles of transmission pipe line.

Q. Did you select the location for these pipe excavations or exposures?

A. I did not. It is my understanding that these locations were selected by a representative of the Central Service Corporation.

Q. In making the pipe observations, the results of which are herewith set forth, you personally observed the exposed pipe at each location and in each case rendered a judgment figure as to the percent condition? A. I did.

Q. Please explain the method used in arriving at the percent condition in the pipe line at each location where the pipe was exposed for examination.

A. Prior to the inspection at each location, the pipe was meticulously cleaned, removing all dirt, rust and scale so that a clean metallic surface was presented for observation. At each inspection location, approximately a five-[fol. 1689]-foot section was so treated. The soil was removed below the bottom of the pipe for a distance of from eight inches to one foot, thus making possible a complete inspection of the bottom surfaces as well.

The pipe was carefully scrutinized over its total surface and any irregularities other than mechanical or mill blemishes, which were ascertained to be due to corrosion, were measured for depth with an Ames Dial Gauge registering in mils. The deepest of these was recorded at each location on the field inspection sheet.

The outside diameter of the pipe was calipered in a horizontal and vertical plane and notations made as to depth of cover and the soil type at each location.

. . . . . .

[fol. 1691] Q. Were any of these inspections made on the new 24" loop lines which were laid in 1939 and 1940?

A. No inspections were made on these 24" loop lines, as they had been laid so recently and coated in their entirety so that they were considered as being in a 100 percent condition.

. . . . . .

[fol. 1696] Mr. Littman: Yes.

Will you please turn to Page 7, Mr. Riddle, and state whether or not the figures in the column, headed "Maximum Pit" are expressed in hundreds of an inch?

The Witness: You mean, how the maximum pit is expressed in one-hundredths of an inch?

Mr. Littman: What does ".04" mean, for instance?

The Witness: That is four-hundredths of an inch. That is the depth of the pit we measured.

Mr. Littman: Now, Mr. Riddle, I wish you would turn to Page 17, and tell us whether you were present at these two inspections shown on Page 17?

The Witness: Yes, sir, I was.

Mr. Littman: Now, in order that we may understand the method you used, will you please take the inspection No. 9 on Page 17 of your Exhibit 81, and explain the various numbers and terms on that inspection report and then tell us precisely how you arrive at the pipe condition of 85 plus percent.

[fol. 1697] Just give us the detailed method that you used.

The Witness: Well, starting on, of course, we have the location of the particular inspection No. 9, by township, county and property ownership.

Mr. Littman: What does the next figure mean?

The Witness: That means, 100 feet west of the center line of the road and at a plus marking of 137 plus 86. That is a surveyor's plus mark for length of the pipe line.

Pipe Lines are measured in that manner from stile to stile. Immediately below that, you will notice there is "L. P." and "M. P.", meaning low pressure and medium pressure; field or service referring to service lines and transmission lines and you will note that I have ringed transmission.

Immediately under that is "depth of cover—36", indicating 36 inches of over-burden on the pipe line.

Mr. Littman: At that point?

The Witness: At that particular point.

"Kind of soil", you will notice that I have indicated clay and loam. There are also other types of soil shown

here, but I have indicated clay and loam at that particular location.

"Material determination", nothing was done with that in this particular case.

Mr. Littman: What does that mean, what would be done?

The Witness: In case we were trying to determine in [fol. 1698] the field whether it was wrought iron or steel, we have a method of making a field determination by microscope.

The pipe is etched in the field and we examine it in the field so we can determine whether the pipe is steel or wrought iron.

Of course, we knew what it was in this case and we did not have to do that.

Mr. Littman: You did not have to do that at this time?

The Witness: Not at any time in this case, no, sir.

Mr. Goodman: Let me ask one question at this point, if I may.

What condition would you characterize as zero percent and what condition would you characterize as ten percent?

The Witness: That would be very hard for me to do unless I were able to see the pipe.

Mr. Goodman: Can you state your standards upon which you based your calculations of percent condition?

The Witness: My standards are simply, you might say, a judgment figure based on a large number of inspections that I have made from time to time, and comparing, perhaps in my mind's eye, a piece of new pipe right alongside of it with due consideration to wall thickness of the pipe.

It is merely a judgment figure. That is all I can say.

Mr. Goodman: What are the factors which enter into the judgment?

[fol. 1699] The Witness: Well, perhaps the type of soil, the environment, the depth of pitting on the pipe, how general that pitting is, whether it is continuous around the pipe, whether it is confined to the bottom surface only, the top or top shoulders, or the sides.

They would be factors that entered into it.

Mr. Goodman: I would like to ask you this question:

Did you compare the serviceability of a particular piece of pipe with the serviceability of pipe in 100 percent condition? Is that the basis of your judgment?

The Witness: I did, in what you might say my mind's eye.

Mr. Goodman: Well, then, a piece of pipe that you would rate at ten percent would have a serviceability, say, of one-ninth of that which you would rate at 90 percent, would that be correct?

The Witness: No, I would not say it was.

Mr. Goodman: I see. Therefore, you are not able to furnish me with any standard of comparison objectively for a 10 percent condition or a 90 percent condition, is that right?

The Witness: I can compare for you a 90 percent condition pipe line with a 100 percent condition pipe line if I have them immediately before me.

I have to see the pipe because there are so many things that enter into particular condition, you cannot say, of your own accord, that a certain piece of pipe, even from a picture, is 90 percent, 100 percent, or 50 percent.

[fol. 1700] Mr. Goodman: Have you ever seen a pipe which you would rate at 50 percent?

The Witness: I have.

Mr. Goodman: Is it in this plant?

The Witness: No.

Mr. Goodman: What would be the characteristics of the 50 percent pipe?

The Witness: Fifty percent pipe would be pipe that is fairly-well corroded, probably in its entirety. Maybe at a particular location, there would be several leak clamps on the line, but the line was still in service transmitting gas, and there was no leakage whatever.

Mr. Goodman: What would that 50 percent condition mean with respect to serviceability?

The Witness: I do not believe that that would enter into the serviceability, as far as transporting gas is concerned.

Mr. Goodman: Well, would one have a right to assume from it, for example, that 50 percent of its service life had departed?

. . . . . .

[fol. 1702] The Witness: Absolutely not. That line could undoubtedly go on carrying gas for a number of years. You might say that 50 percent of its value had departed.

Mr. Goodman: I will stop here.

Trial Examiner: Are there any other questions?

Mr. Littman: Yes.

Mr. Riddle, you were explaining Inspection Report No. 9 on page 17—

The Witness: That is right.

Mr. Littman: When Mr. Goodman asked you some questions. Now, will you proceed with your explanation of Inspection Report No. 9?

The Witness: I believe I left off at material determination, just after that.

Mr. Goodman: Yes.

The Witness: The next statement is "Pipe coated paint yes or no." You will note there that I have indicated that the pipe was not coated or painted.

Mr. Littman: Well now, what does the term "Yes" mean there?

The Witness: That in case it had been coated I would [fol. 1703] mark "pipe coated" and mark "Yes" or if it had been painted I would have marked it "Painted" and "Yes."

The next statement is "Kind of joint." Where no joint either weld or coupling appeared in the excavation, nothing was indicated in that space.

Trial Examiner: That is, Mr. Riddle, you are using a printed form and where the alternative is shown you have encircled the condition which you wish to designate as applicable to the particular inspection?

The Witness: That is right, sir.

The next is "Inventory Data." That is from inventory sheets, the nominal size of the pipe, 18-inch with the nominal wall thickness.

Immediately under that is the material, whether it was steel, wrought iron, cast iron. You will note that I have indicated steel.

Mr. Littman: Just a minute, what do you mean by this nominal size and "nominal wall thickness"?

The Witness: The nominal size would be the calipered size of the pipe as stated on the inventory sheet. The size of the pipe.

Mr. Littman: Pipe new?

The Witness: Pipe new, yes.

Mr. Littman: That is the ordinary or usual wall thickness at which this pipe is purchased new?

[fol. 1704] The Witness. That is right.

Mr. Littman: There is some tolerance from that, I take it, is there not?

The Witness: There is.

Mr. Littman: It is not all exactly .281, is it?

The Witness: No.

Mr. Littman: Will you proceed with your explanation?

The Witness: Immediately under that is material, steel, which I have indicated. We knew, of course, the pipe was steel and the type, whether screw, plain-end or weld or bell and spigot. Of course, in the case of cast iron it would have been marked "Bell and spigot" if it were.

Then the job numbers, the job on which I worked is indicated by C-1350.

Mr. Littman: I don't recall whether you told us what kind of joint was on this pipe.

The Witness: No, as I said before if the joint did not show in the excavation, the point of excavation, that was left blank, as it wasn't observed. If the weld happened to be at that location, where by happenstance the excavation was made, I would mark it "weld."

Mr. Littman: Do you happen to know what kind of joint was actually on this pipe?

The Witness: Yes, it was both weld and dresser coupling.

[fol. 1705] Mr. Littman: But you didn't make a notation unless—

The Witness: Unless I actually hit one of those locations.

Mr. Littman: I see. All right. Will you proceed with your explanation?

The Witness: Now, at the top of the page, the line B, that designates which one of the three lines it was on the system. Then the nominal size, 18-inch, wall thickness. Now, the next—

Mr. Littman: Pardon me, before you go to the next one will you tell us why you repeat the same data as to nominal size and wall thickness?

The Witness: Well, one was from inventory sheets and the other is just a repetition. If we would not fill out on this one side for our own use we would repeat it up there at the top of the page. In this case we filled out everything we had except for material determination.

Mr. Littman: The nominal size and wall thickness figures which appear for the second time do not represent actual measurements, do they?

The Witness: No, not right there. Immediately below that it does, as far as the outside diameter is concerned.

Mr. Littman: Yes, I see. I thought there might be some distinction by reason of the fact that you have the term "Inventory Data" below.

[fol. 1706] The Witness: Those are selected from the inventory sheets, it is designated on the inventory sheets, themselves.

Mr. Littman: In both instances?

The Witness: No, well, I presume that that nominal size 18-inch is from inventory sheet and inventory data, also.

Mr. Littman: I see, that is just a pure repetition?

The Witness: That is pure repetition.

Mr. Littman: And those sizes come directly from the inventory data.

The Witness: Now shall I proceed?

Mr. Littman: Yes, if you please.

The Witness: Immediately below that is the calipered outside diameter, you will notice H. and V. which designates the horizontal and vertical plane at which this pipe was calipered.

Mr. Littman: This represents the actual measurement in the field?

The Witness: Yes.

Mr. Littman: After the pipe has been cleaned?

The Witness: After the pipe has been cleaned.

Mr. Littman: You may proceed.

The Witness: Immediately below that is the description of the pitting which was noted at this particular location. We have rather numerous descriptions there, but those

[fol. 1707] certain pitting descriptions were indicated which served to represent the condition of the pipe at the particular location where it was observed. In this case the pitting was very small and though sharp scattered over the entire surface of the pipe, but they were very few.

. . . . . .

Mr. Littman: All right, will you proceed with your explanation? I believe you got as far as maximum pit depth and average estimated depth. Will you explain those for us?

The Witness: Yes, the maximum pit depth, as I said in my previous testimony, was measured with an Ames dial gauge after the pipe was cleaned. The Ames dial [fol. 1708] gauge was set immediately over the pit and the reading was taken on on the dial which read in mills and in this case the maximum pit depth was .06.

Mr. Littman: How many pits did you measure at this particular point before you hit the deepest pit?

The Witness: Well, when we went into the excavation we would start at the top surface. We would scrutinize the top surface very carefully and measure pits as we went along, every pit we could see that looked like it might be deeper than the previous one until we struck with a series of measurements the deepest pit and that was recorded.

Now, from observation the average estimated depth was .01 at this particular location. None of these pits were recorded except the deepest pit.

There is no computation put down on paper, but that .01 is purely an estimate after we had obtained the maximum pit depth.

Mr. Littman: Well, that is the average depth of how many pits at this point?

The Witness: That is a judgment figure on the estimated depth of the pits.

Mr. Littman: Well, I think I understand that .05 inches is the maximum.

The Witness: .05, I beg your pardon, I was looking at the maximum figure. They are both on the same page.

[fol. 1709] Mr. Littman: Referring to Inspection Sheet No. 9, I understand that .05 represents the deepest pit that was found.

The Witness: That is right.

Mr. Littman: Over the four feet of exposed section of pipe.

The Witness: That is right.

Mr. Littman: Now then, you have averaged estimated depth .01 inches. Isn't that the average of all the pits that was measured?

The Witness: That is an estimated average of all the pits that were measured.

Mr. Littman: What do you mean by estimated average, Mr. Riddle?

The Witness: Merely a judgment, as you go along you record in your mind the depth of the pits as you go. Now this was not put down on paper, but you can easily estimate in the field the average depth of those pits.

Mr. Littman: You could very easily calculate the exact average, couldn't you?

The Witness: Well, there are so many small irregularities on the pipe, perhaps due to corrosion, that are immeasurable. They are visual but you can't put an Ames dial gauge on them and get any depth that is readable.

Mr. Littman: Then, the fact, as I understand it, is [fol. 1710] that you didn't record the measurements of all the pits?

The Witness: No.

Mr. Littman: And then you added them up and divided by the number of pits to secure the average estimated depth, did you?

The Witness: No, I did not.

Mr. Littman: That is just a judgment figure, is it?

The Witness: That is the estimated judgment figure.

Mr. Littman: And it might be higher or lower than the average figured mathematically, might it not?

The Witness: I believe it would be very close to the average in this particular case.

Mr. Littman: Well, you don't know if you didn't average it up mathematically, do you?

The Witness: It wouldn't be off very far.

Mr. Littman: All right, now the next item I think is "Field Estimate of Pipe Conditions, 85 Plus." Will you tell us how you arrived at that?

The Witness: That, also, is a judgment figure.

Mr. Littman: Well, judgment arrived at from the data which appears on Inspection Sheet No. 9?

The Witness: Which appears on Inspection Sheet No. 9, that is correct.

Mr. Littman: Was any other data considered?

The Witness: No other data except visual inspection.

[fol. 1711] Mr. Littman: Which is recorded on this inspection sheet?

The Witness: Which is recorded on this inspection sheet.

Mr. Littman: Well now, we have all the data, then, before us up to this point.

Now, tell us how you got to 85. I am trying to bridge the gap there. Give us the mental process that you went through to get the 85.

The Witness: When you are in an excavation and you have a piece of pipe immediately before you—

Mr. Littman: (Interposing) Let's take this excavation, if you will pardon me.

The Witness: Yes, sir, this excavation. You have a piece of pipe before you and you have gone over it, measured pit depth, examined the bottom very carefully and meticulously. Then you compare, after seeing a great

number, perhaps, of other excavations with pipe, maybe worse or better, you compare that with new pipe, taking into consideration wall thickness, the depth of penetration in this particular case and you render then a judgment figure. That is, my judgment figure, the percent condition of that pipe. It is just slightly better than 85 percent.

Mr. Littman: Did you calculate what the percent condition would be when calculated mathematically by relating the maximum pit depth to the original wall thickness?

[fol. 1712] The Witness: No.

Mr. Littman: You didn't make any such calculation?

The Witness: No such calculation.

Mr. Littman: And you didn't make any such calculation with respect to the so-called average estimated depth?

The Witness: No, as I say, this is entirely my judgment figure.

Mr. Littman: In other words, you didn't go through any mathematical calculation before you arrived at 85?

The Witness: No, I did not.

Mr. Littman: And you have told us all that you can tell us, have you, about how you got your 85?

The Witness: It is just simply by a judgment figure, that is all I can say.

. . . . . .

[fol. 1718] Francis S. Haberly was called as a witness on behalf of Michigan Gas Transmission Corporation and being first duly sworn, was examined and testified as follows:

. . . . . .

By Mr. Porritt:

. . . . . .

My name is Francis S. Haberly and I live in Chicago, Illinois, and I am a consulting engineer with offices at 122 South Michigan Avenue, also in Chicago.

. . . . . .

I was educated in grade and high schools at Fort Wayne, Indiana, completing the latter in 1914. This schooling was supplemented by intensive engineering study on my own part, together with extension courses in engineering [fol. 1719] and business administration.

I was futher benefited by practical experience as an apprentice in the student course of the General Electric Company at Fort Wayne, Indiana.

In 1916, following my student training, I entered the engineering department of the Fort Wayne & Northern Indiana Traction Company.

After a summer spent as a laborer on construction and maintenance work, I became a draftsman and general assistant to the engineer of ways and structures and to the superintendent of overhead construction.

Later I became an assistant engineer and my duties consisted of design, surveys and engineering for construction and maintenance of track, structures and overhead. In 1917, under the personal direction of the president of the company, the late Robert M. Feustel, I made an appraisal of a large part of the company's street and interurban railway property.

Following two years in the Army as an officer of artillery, I joined the consulting engineering staff of Mr. Feustel and was employed by him until he disbanded his organization in 1924, my duties being principally in connection with valuation and appraisal work. Such work included the following: The Indiana Service Corporation at Fort Wayne, Indiana, in 1919. This was a repricing and bringing down to date of the appraisal which I had [fol. 1720] made in 1917 prior to my entry into the Army. This work was done largely by the use of indexes.

The Nashville Railway & Light Company in Nashville, Tennessee, in 1920. This was an inventory and unit cost appraisal of railway and light and power property. The original cost was also determined partly upon the basis of book analysis and partly by the use of indexes.

The Great Northern Paper Company in Millinocket, Maine, in 1920. This was an inventory and unit price appraisal for tax purposes.

The Philadelphia Rapid Transit Company, Philadelphia, Pennsylvania, in 1921 and '22. This was an inventory and unit price reproduction cost appraisal with original cost being determined by detailed indexes. Mr. Feustel in this case represented the City of Philadelphia.

The Frankford Elevated Company, Philadelphia, Pennsylvania, in 1922. This work consisted of setting up property records of a city-owned elevated.

The Tennessee Electric Power Company, Chattanooga, Tennessee, in 1923 and 1924. This was an inventory and unit price appraisal of street railway, light and power and hydro-electric property. Reproduction costs at various other price levels were obtained by indexes.

In April, 1924, I took a temporary assignment as special assistant to the general manager of the Tennessee Elec- [fol. 1721] tric Power Company in matters connected with rate analysis, valuation and preparation of technical exhibits for court cases involving rates and valuation.

In December, 1924, I was employed by Mr. William F. Sloan of Chicago on valuations of the New England Telephone and Telegraph Company with property in five of the six New England States. Also the Cincinnati & Suburban Bell Telephone Company and the Ohio Bell Telephone Company.

In May, 1926, following my work with Mr. Sloan, I was employed by the late Albert S. Richey and remained with him, first, as an employee and later as an associate until his death in June of 1936. Mr. Richey was Professor of Electrical Engineering at Worcester Polytechnic Institute at Worcester, Massachusetts, as well as being a nationally known engineering consultant.

During my association with Mr. Richey I was actively connected with or in responsible charge of the following appraisals:

United Traction Company, Albany, New York, in 1926. This work consisted of checking an appraisal made by the company and determining costs at various price levels by indexes. Mr. Richey in this case represented the City of Albany.

The Nashville Railway & Light Company, Nashville, Tennessee, in 1926 and '27. This was an inventory and unit price appraisal of the street railway and light and [fol. 1722] power property on which I had worked in 1920 under Mr. Feustel. In this case Mr. Richey represented the State Commission.

The Tennessee Electric Power Company in 1927 and '28. This was an inventory and unit price appraisal of property on part of which I worked in 1923 under Mr. Feustel. The property included one street railway system, considerable hydro-electric property, electric generating, transmission and distribution systems covering more than one-half of the state as well as several water companies. It is this property which was sold to the Tennessee Valley Authority and is now operated by that Authority. Indexes were used on minor parts of this work. Mr. Richey, again, in this case represented the State Commission.

Southern Public Utilities in North and South Carolina in 1929. This was an inventory and unit price appraisal of street railway, light and power and gas property. For this work I took leave of absence from Mr. Richey and was employed by Jackson & Moreland of Boston, Massachusetts.

In 1930 I returned to Mr. Richey's employ and made an inventory and unit price appraisal of that part of the Third Avenue Railway System located in Westchester County, New York.

In 1931 this appraisal was repriced and brought down to date by means of indexes. Other jobs of lesser importance during the period 1931 to '35, included the following: [fol. 1723] Toledo, Bowling Green & Southern Traction Company, Conestoga Traction Company, Conestoga, Pennsylvania, Omaha & Council Bluffs Street Railway Company, Chicago, North Shore & Milwaukee Railroad Company, the Ottawa Electric Railway Company, the Sioux City Gas & Electric Company. My work in this latter case consisted of the development of indexes for the gas property.

In 1933 an appraisal of the Louisville Gas & Electric Company in Louisville, Kentucky, was made by the use

of indexes. This work covered electric light and power, natural gas fields and gas transmission lines, artificial gas plants and the attendant distribution system.

Public Service Company of Northern Illinois in 1933. This was a valuation of light, power and gas property made by the use of indexes.

An appraisal made by the application of unit prices to the same property as of the same date by independent engineers produced results differing by 5 percent.

The Commonwealth Edison Company, the Chicago District Electric Generating Corporation and the Super Power Company of Illinois in Chicago in 1934 to '36. This was an appraisal of the electric light and power property in the City of Chicago in which reproduction cost was obtained by the application of detailed indexes to the original cost.

An appraisal made by the application of unit prices to [fol. 1724] the Commonwealth Edison portion of the property as of the same date by other engineers produced results differing by 1.7 percent.

Chicago Rapid Transit Company, Chicago, Illinois, in 1936. This was an appraisal made by us of indexes for tax purposes.

The People's Gas, Light & Coke Company in 1935 to '38. This was an appraisal of the gas property in Chicago in which reproduction cost was obtained by the application of detailed indexes to the original cost. Here, again, an appraisal made by the application of unit prices to the same property as of the same date by independent engineers produced results differing by 1.6 percent.

In June, 1936, Mr. Richey died suddenly and I have since carried on the business under my own name. I continued such work of Mr. Richey's as was then in progress which consisted of presenting the testimony in the People's Gas, Light & Coke Company case and in making a revaluation as of a later date.

The valuation work done by me since that time has included a tax valuation of a part of the Third Avenue Railway System in New York in 1938, an inventory includ-

ing the setting up of property records for the Montreal Light, Heat & Power Consolidated in Montreal, Quebec, in 1939 and '40 and in the same two years an inventory and unit price appraisal of the properties of the Pittsburgh Railways Company for purposes of reorganization.

[fol. 1725] At the present time I am engaged in making appraisals of the property of the Chicago Rapid Transit Company, the Chicago Surface Lines and the Chicago Motor Coach Company, all in Chicago. These last three named valuations are being prepared by the application of indexes to previous appraisals or to original cost.

There are currently prepared in my office construction cost indexes of electric light and power, artificial gas and electric railway properties which reflect the variation in construction costs of typical properties, exclusive of land, on a nationwide basis.

I am a member of the American Institute of Electrical Engineers as well as a member of the American Transit Association.

Q. Mr. Halverly, were you asked to make a determination of the existing accrued depreciation on the various structures on the property as well as on the equipment in the measuring and regulating structures and also on the general equipment?

A. I was.

Q. Did you make such a determination? A. I did.

Q. I show you an exhibit marked "Michigan Gas Transmission Corporation, Accrued Depreciation on Com-[fol. 1726] pressor Station Structures, Measuring and Regulating Station Structures and Equipment, Other Transmission System Structures and General Equipment as of June 30, 1941" and ask you if this was prepared by you or under your direction?

A. It was.

. . . . . .

(Document referred to was marked Exhibit No. 82 for identification.)

Q. Did you inspect the property on which you determined the existing accrued depreciation?

A. I did. The property was inspected by myself and my principal assistant on August 13 and 14 and I made a further inspection on September 26, all in this year. On both occasions I was accompanied by Mr. C. D. Alstadt, superintendent of transmission of the Michigan Gas Transmission Corporation.

I inspected the buildings and structures at the three compressor stations in considerable detail. Structures at these locations comprise all of the compressor station structures as well as all of the miscellaneous transmission system structures on the property.

In addition, I inspected the measuring and regulating [fol. 1727] structures at Detroit as well as many of the smaller measuring and regulating structures, including their equipment, which are scattered over the property.

In the course of this inspection of the structures and as a result of considerable time spent in the company offices, both in Detroit, Michigan, and in Fort Wayne, Indiana, an opportunity was offered to see practically all of the general equipment such as the furniture and other miscellaneous equipment.

Q. As a result of the inspection which you have just described, will you please state the condition in which you found the structures and the other items of property upon which you were asked to determine accrued depreciation.

A. The condition of the structures and of the measuring and regulating station equipment was extremely good. Practically all of the structures had been built since 1936 and, therefore, are comparatively new and modern in type of construction. There were practically no signs of age, wear, weathering or deterioration and the entire property was extremely clean and orderly, in excellent repair, very well maintained, well painted and gave every evidence of exceptionally fine housekeeping.

I have inspected many properties in the course of my valuation work, including properties of street railway companies, electric light and power companies and arti- [fol. 1728] ficial and natural gas companies and have never seen an entire property in an equally high state of

maintenance. In fact, little could be found indicating depreciation due to physical deterioration alone.

In arriving at condition percent for the structures and for the equipment in the measuring and regulating station structures, consideration was given to the effect of wear and tear, action of the elements, the degree of serviceability, the state of maintenance, obsolescence as well as the age and probable future life use.

Q. In arriving at your condition percent for these parts of the property, did you use a straight-line method of depreciation?

A. No, I did not. I have just explained the various things which were given consideration and I would like to state the condition in which I found this property offers strong evidence that well maintained property does not depreciate on a straight-line, but depreciates less rapidly during its early life than it does in later years.

I did give consideration to age and life in arriving at my final conclusions as to the condition percent of the property, but I did not use the so-called straight-line method. I was not determining the amount which might be set up annually in order to amortize the property over a specific number of years, but I was determining in my [fol. 1729] best judgment the actual existing conditions of the property at the present time.

Q. In the discussion you have just given as to your determination of accrued depreciation, you have limited yourself to the structures and to the measuring and regulating station equipment. Were you not also asked to determine the percent condition of the general equipment?

A. I was.

The property included under the heading of "General Equipment" consists of the office furniture and fixtures, the transportation equipment such as automobiles, trucks and tractors, the stores equipment which is composed largely of pipe racks and the tools and work equipment which is made up of concrete mixers, portable pumps, surveying instruments and all other small tools. Property of this kind has relatively a short life as compared to the structures and equipment. It was found to be in very

good physical condition, well maintained and repaired and for the most part of quite recent purchase.

In determining the percent condition of this character of property, the same considerations were given to the effect of wear and tear, action of the elements, degree of serviceability, state of maintenance as well as age and probable future life.

This property was depreciated at a faster rate because [fol. 1730] of its comparatively shorter life and consideration was given to the salvage or trade-in value which probably would be realized upon replacement or retirement.

Q. Would you indicate in a general way the conditions which you found?

A. The conditions are expressed numerically in Exhibit 82. For the compressor station structures, the largest of which are the main compressor buildings and the auxiliary buildings, I found a condition percent of 94.8 for the property constructed in 1936, 96 for the property constructed in 1937 and 97.7 to 98.1 for the property constructed in 1940.

For the other transmission system structures consisting largely of residences and garages, I found conditions ranging from 89 for the 1936 construction to 98 for the 1940 construction.

In account 354.1, Compressor Station Equipment, I included certain items which were considered to be structures and upon which I placed the condition percents. These comprise the cooling towers and their foundations and the elevated water tanks and their foundations. Condition percent for the cooling towers ranged from 91 percent for those constructed in 1936 to 97 percent for those constructed in 1940. For the water tanks, including their foundations, the conditions ranged from 96 percent for the 1936 construction to 99 percent for the 1940 construction.

[fol. 1731] For the smaller structures included in Account 354.2, Measuring and Regulating Station Structures,

as well as to the equipment therein, conditions ranged from 77 percent for property built in 1931 to 99 percent for property built in 1940.

Q. Mr. Haberly, the last statement that you made, you said for the smaller structures included in Account 354.2. Isn't that 352.2?

A. I probably mis-spoke it; 352.2.

With regard to the general equipment, condition percents as determined by me are as follows:

For the office furniture and equipment, 78 percent; for the transportation equipment, 71 percent; for the stores equipment, 90 percent; and for the tools and work equipment, 79 percent.

. . . . . .

Mr. Goodman: I have some difficulty in understanding just what you mean by the use of the word "condition." [fol. 1732] Do you mean something different from or something in addition to its state of physical integrity?

The Witness: Conditions which I have applied here indicate something somewhat below its state of physical integrity because I have given consideration to age and probable future life and serviceability.

Mr. Goodman: So that you have used these factors in accumulated fashion with the result that you have made a deduction for deterioration and then you have added to that deduction something for other factors. Is that right?

The Witness: Not necessarily added something for the other factors, but in arriving at my final conclusion I have taken them into consideration.

Mr. Goodman: Well now, you say that you have considered the probable future life in use. In what way would the probable future life affect the present condition?

The Witness: It would affect it if I am giving consideration to age, in that I have to take into consideration the probable life in order to give effect to age.

Mr. Goodman: Now, did you in every instance give effect to age?

The Witness: In practically every instance, as I recall, the condition which I placed upon the structures is lower in my opinion than its physical condition.

Mr. Goodman: Well, will you state how you gave effect to age?

[fol. 1733] The Witness: By lowering the condition percent that I had formed in my judgment as representing its strictly physical condition.

Mr. Goodman: I had in mind you would give me the processes of giving effect to the matter of age.

The Witness: There are no processes, it is simply a matter of judgment. No mathematical calculations are performed in weighting the various elements I considered.

Mr. Goodman: Did you consider the number of years in service which the article under examination had?

The Witness: I did.

Mr. Goodman: And let us assume, for example, that it was five years. Now, did you consider its probable future life?

The Witness: I had that in mind, yes, sir.

Mr. Goodman: What figure did you use for its probable future life, if any?

The Witness: I would have to know what particular piece of property we are discussing.

Mr. Goodman: Well, you used different figures for different pieces of property, then?

The Witness: Naturally, I would.

Mr. Goodman: And did you not consider that its probable future life might be limited by the exhaustion of the wells?

[fol. 1734] The Witness: I did not use that as the probable future life.

Mr. Goodman: I take it that you took into consideration, then, its probable future life as dependent upon factors of deterioration and obsolescence?

The Witness: Right.

. . . . . .

Mr. Goodman: Well, what reason could you advance for marking down the property on the ground or score of obsolescence?

The Witness: There was no obsolescence.

Mr. Goodman: In other words, you considered obsolescence and rejected it as an effective cause of depreciation. Is that right?

The Witness: No, if I had found obsolescence in the property I would have given it consideration. I found none whatever.

Mr. Goodman: So that we can strike obsolescence out of this picture, completely?

The Witness: As being reflected in the condition percent. It is, however, one of the elements which I gave consideration to.

Mr. Goodman: Now, you then obtained a percent depreciation indicative of a state of physical integrity by con- [fol. 1735] sidering the physical evidences of deterioration and the age of the property in service as compared with its probable physical life. Isn't that right?

The Witness: Yes, in a measure, however, the condition which I place on practically every structure is, in my judgment, lower than the condition I would have placed there on purely considering physical integrity.

Mr. Goodman: Why did you place it lower?

The Witness: Because age, I believe, is an element which should be taken into consideration in determining depreciation because there are occasionally points of deterioration which cannot be seen and because in all of my determinations of condition percent my effort has been to reflect the effect of age independent of the physical condition as seen.

Mr. Goodman: Well now, the first part of your answer agrees with what I thought you did as represented in my question to which you said "Yes, in a measure." That is

to say that you used age as a guide to your judgment in revealing to you the presence of invisible deterioration or its life probability.

The Witness: It is used for that purpose and also for the others which I mentioned.

Mr. Goodman: Well now, can you state the extent to which you depreciated any item of property here by reason of its age in comparison with its physical service life and, [fol. 1736] also, the extent to which you considered that age as indicative of invisible deterioration on the one hand, and as indicating some additional reason for further depreciation? Can you give an example of that?

The Witness: No, I don't believe I can do that. Age and the other elements which I considered were all taken into consideration, but I do not think I can give you an example breaking it down into the various elements and weights which were assigned thereto.

Mr. Lee: Well then, what you did all through, what you really did was to exercise your judgment upon your observation of the property?

The Witness: Exactly.

. . . . . .

Mr. Lee: And there is no way to apply any test to your statements, is there? For example, if you said that the [fol. 1737] present condition was 96 percent and some other witness said it was 94 percent, it is just a question of judgment on your part and a question of judgment on his part, if he arrived at it the same way you did.

The Witness: I think that is correct. I do not think that depreciation can be determined with precise mathematical accuracy.

Mr. Lee: No, but when you say that you comprehend certain factors, obsolescence and things of that kind, you don't break them down into percentages, you don't add them up, you don't use them, really, at all, it is simply just your independent judgment.

The Witness: They are the guides to my judgment and the things which I am looking for as I formulate my opinion as to the condition of the property.

Mr. Lee: Yes, but when you say they are the guides to your judgment you are not able to tell us on cross-examination how much credence you gave to each of the guides, are you?

The Witness: It would depend upon the individual case.

Mr. Lee: Did you have any work sheets?

The Witness: Yes, I did have.

Mr. Lee: And did your work sheets break it down?

The Witness: They did not.

Mr. Lee: And you want us to understand now that we [fol. 1738] should accept your version of the physical condition of this extensive property without any breakdown as to how you arrived at it?

The Witness: Well, I have explained the elements which I gave consideration to and the conclusion I arrived at.

Mr. Lee: No, but you give us no means whereby we can test your consideration, there is no breakdown.

The Witness: I do not think I am able to.

Mr. Lee: Well, there isn't any breakdown, we can agree on that, can't we?

The Witness: That is correct.

Mr. Lee: Now, did you limit your depreciation to obvious depreciation which could be rectified by repair, for example, or repainting?

The Witness: Oh, no.

Mr. Lee: You didn't consider that?

The Witness: I considered it, but I went beyond that.

Mr. Lee: Well then, you want us to understand that outside of any depreciation that was obvious to the eye, that you fixed a certain amount for that and then you added in additional to cover any depreciation due to obsolescence, to age, to use or to depreciation that was unable to be determined by observation?

The Witness: In effect, that is what was done.

Mr. Lee: And what was that percentage?

[fol. 1739] The Witness: For what particular item?

Mr. Lee: For any item. Give us any example.

The Witness: All I can do is pick one of the items to which I applied condition. What item would you like me to pick?

Mr. Lee: Well, I am particularly interested in the service of the Detroit area. Let's take some measuring equipment in the service to the Detroit area. Let's take the regulating station on page 4. Now, you have got on page 4, Detroit regulating station, 1937-40, condition of structure, 97.7 percent; equipment, 96 percent. Is that right?

The Witness: That is right.

Mr. Lee: Now, tell us. There is 2.3 percent off from the hundred, isn't there? That is the average that was taken off the structures at that location?

The Witness: That is right.

Mr. Lee: Now that comprehends quite a considerable structure, doesn't it?

The Witness: There are a number of structures.

Mr. Lee: And this percentage comprehends them, doesn't it?

The Witness: It does.

Mr. Lee: So you want us to take your word for it that upon those structures, the present condition as against 100 percent is off 2.3 percent. You don't give us any break-[fol. 1740] down as to how you arrived at the 2.3 percent.

The Witness: I explained the things which I gave consideration to and the 97.7 is that result.

Mr. Lee: No, but what you gave consideration to is all in the back of your mind. You don't tell us what percentages or how you arrived at it. This is just your "ipse dixit", you arrived at it and that is so?

The Witness: It is a result of my considered judgment.

Mr. Lee: I know, but I have a right to explore how you arrived at it.

The Witness: And I have explained it.

Mr. Lee: No, but you still don't tell us how you can break it down, do you?

The Witness: I don't think you can break it down because there are no mathematical conclusions involved.

. . . . . .

[fol. 1741] Mr. Goodman: I do have another question. I want to know if salvage is a factor in your present condition, or if that is excluded?

The Witness: I took salvage into consideration in arriving at my percent condition, yes.

Mr. Goodman: That does not answer my question. What I want to know is, whether you excluded it as a factor in your percentage, or if it is somehow included in the percentage?

The Witness: The effect of it is included in the percentage.

Mr. Goodman: By what manner or method? In other words, what is the percent condition of an article ripe for salvage?

The Witness: May I hear that question?

Mr. Goodman: What is the percent condition of an article ripe for salvage?

The Witness: Its percent condition is the salvage value.

[fol. 1742] Mr. Goodman: So that to the extent your percentage speaks of value, it contains the residual salvage value, is that right?

The Witness: Yes, it does.

Mr. Goodman: Now, I have some difficulty, and maybe you can help me in reconciling a concept of value with a concept of percent condition.

The Witness: My percent condition does express the value percentage-wise, in my opinion.

. . . . . .

Mr. Littman: Mr. Haberly, when you find a compressor station structure or a measuring and regulating station structure or any equipment that is referred to in Exhibit 82 in 90 percent condition, does that mean that 10 percent of the life of the property has expired and that 90 percent of its life remains?

The Witness: No, sir.

Mr. Littman: Does it mean that 10 percent of its value has depreciated and 90 percent of its value remains?

The Witness: That is the result I am trying to express in my percent condition.

. . . . . .

[fol. 1743] By Mr. Porritt:

Q. Mr. Haberly, have you been asked by the company to prepare an estimate of the cost of reproduction new of the plant and property of the Michigan Gas Transmission Corporation as of June 30, 1941, exclusive of working capital, materials and supplies, cost of developing business or going value?

A. I was.

Q. Did you prepare such an estimate?

A. I did.

Q. I hand you herewith an exhibit entitled "Michigan Gas Transmission Corporation, Reproduction Cost New of Plant and Property as of June 30, 1941, exclusive of Working Capital, Materials and Supplies, Cost of Developing Business or Going Value," and ask you if this was prepared by you, or under your supervision?

A. It was.

. . . . . .

(The Document Referred To Was Marked Exhibit No. 83 [fol. 1744] For Identification.)

Q. Will you explain, generally, the method by which this exhibit was prepared?

Mr. Littman: Just a minute, I want at this time to object to any testimony with respect to this exhibit for the reason that it states, on its face, that it is an estimate of reproduction cost new of plant and property.

The reasons for my objection have been stated from time to time on this record, if your Honor please. I want the record at this time to show an objection to this testimony, as well as to this exhibit.

Mr. Lee: Your Honor, on behalf of the Petitioner, City of Detroit, in these proceedings, I should like to make the same objection as made by counsel for the Commission, Mr. Littman.

Trial Examiner: I will ask you, Mr. Porritt, to confine the questions you will be permitted to ask to the content of the exhibit by way of general description and a statement of what the witness has done in the preparation of this proposed exhibit, irrespective of what the title page may show as to its substance, but do not, please, ask questions which involve testimony from the exhibit itself.

. . . . . .

[fol. 1746] Q. Mr. Haberly, will you explain, generally, the method by which this exhibit was prepared?

A. The method used in determining the reproduction cost new of the plant and property of the Michigan Gas Transmission Corporation as of June 30, 1941, has been by the application of specific indexes of equipment, materials, labor, and other costs to the original costs of the company's property as obtained from an analysis of the company's records.

The cost of reproduction new, as shown in this exhibit, is the amount in dollars necessary to be expended in order to reproduce the existing plant under the original conditions of construction and predicated upon the same contingencies as were actually encountered in its construction.

Trending by means of index numbers, developed especially with reference to the particular property, involves little or no estimate of labor performance other than a reflection in the index numbers of improvements in methods of construction. Trending does not involve percentage

allowances for warehousing, loss and breakage, supervision, use of tools and equipment, or contingencies.

[fol. 1747] These items are a part of the original cost which constitutes the inventory of dollars to which the indexes are applied.

Q. Will your please state the original cost to which you applied indexes in the manner just described and, likewise, the resulting reproduction cost as of June 30, 1941?

A. Those figures are shown on page 11 of Exhibit 82.

* * * * * * *

[fol. 1752] By Mr. Porritt:

Q. Mr. Haberly, I see by examination of Page 11, that you have included amounts for organization, which is Account Number 301, in the sum of $10,333; also an amount for Miscellaneous Intangible Plant, Account Number 303, in the amount of $73,667; for Land, which is Account No. 351.1, in the amount of $26,146; and for Land Rights, which is Account Number 351.2, in the amount of $241,467.

These amounts, as shown on Page 11, are identical with the original costs of the same items except that they have been rounded off to even dollars. Were these figures sub-[fol. 1753] ject to the application of indexes?

A. No. The items of Organization, Miscellaneous Intangible Plant, Land, and Land Rights are as furnished to me by the company and are included in this exhibit at their original cost and no trending was applied to them.

Q. You stated that the indexes which you developed with especial reference to this property were applied to an analysis of the company's records. Will you describe what this analysis consisted of?

A. Yes. In order to properly apply the indexes to the various elements of the property, it was necessary to analyze company records, including property records, construction ledgers, vouchers, bills, contractors' final estimates, and payrolls.

The character of the analysis was designed to obtain original costs in such form as to permit the application of the indexes to the individual items of property installed in the various years.

In other words, in order to trend a main compressor, it was necessary to obtain its original cost, and the date of its installation. The analysis which was made also covered the determination of unit costs of pipe per ton, labor per hour or per foot of pipe, and such other unit costs as were necessary for our trending purposes.

Q. Will you explain briefly the sources from which you obtained the data necessary for the development of the indexes?

[fol. 1754] A. The data for the development of the indexes were obtained from manufacturers of the equipment and machinery used on this property, from current price quotations as shown in trade publications, from catalogs and price lists and from contractors, and were checked, wherever possible, with the trend of actual costs as incurred during the construction of the property.

The index data covering building materials and labor were weighted in proper proportion to reflect the trend of construction costs in place. By that I mean that the basic indexes of cement, sand, stone, lumber, reinforcing steel and labor were so combined as to result in a trend of reinforced concrete in place.

With regard to the indexes of equipment, those for the principal items of equipment, namely, the main compressor units and auxiliary engines, were computed from the actual prices which have been paid for such equipment by the Michigan Gas Transmission Corporation.

The trends of other items of equipment were based on information from manufacturers, secured especially for this work or from data which we carry currently in our files.

The indexes for steel pipe were developed after analyzing vouchers showing the prices which have actually been paid by this company and from a consideration of information relative to the price at which pipe could have been [fol. 1755] purchased as of June 30, 1941.

Indexes for the installation of mains and laterals were based upon the relation of actual costs of construction to recent construction costs, as well as a consideration of current bids for the installation of comparable sizes of pipe in

comparable territory. Some of the mains were laid in 1930 and 1931.

Present-day methods of installation of mains and present-day construction equipment represent considerable improvement over those used in 1930 and 1931 and, in developing the indexes for application to installation costs of those years, recognition was given to this fact.

In other words, the reproduction cost of mains, as included in this exhibit, covering the construction done during 1930 and 1931 represents a present installation cost using modern methods and modern construction equipment.

Q. Now will you outline very briefly the contents of Exhibit 83, which is your reproduction cost new of plant and property of the Michigan Gas Transmission Corporation as of June 30, 1941, exclusive of working capital, materials and supplies, cost of developing business or going value?

Trial Examiner: Please omit from your answer, Mr. Haberly, any statement of your conclusions.

The Witness: Yes.

The exhibit consists of 64 numbered pages and several [fol. 1756] unnumbered pages and contains, first, a letter of transmittal; next, a table of contents; and then, starting with Page 1 and continuing through Page 7, sets forth my education and experience in much the same manner as I have given it verbally in my testimony.

Page 8 through Page 10, inclusive, states the purpose of the exhibit and the methods used in its preparation.

Page 11, which I have previously referred to in my testimony, shows a summary by accounts of the reproduction cost at June 30, 1941, with the corresponding original costs shown opposite each account.

Page 12 is a reconciliation of the original cost and the reproduction cost, both as of June 30, 1941, reflecting changes due to reclassification as well as setting forth the amounts of transfers, adjustments and other items which were not analyzed by me in my development of the necessary original cost figures for trending purposes.

It can be seen at the foot of column 2 that the items not analyzed total $46,779 as compared to $12,356,105 which was analyzed. The amount not analyzed represents somewhat less than one-half of one percent of the total original cost.

Then, starting on Page 13, there is shown a summary of the reproduction cost of Account 352.1, Compressor Station Structures and Improvements, which is followed on Pages 14 to 25, inclusive, with the details by locations by years:

[fol. 1757] On Page 26 is shown the reproduction cost of Account 352.2, Measuring and Regulating Station Structures and Improvements.

On Page 27 is shown a summary of the reproduction cost of Account 352.3, Other Transmission System Structures and Improvements, which is followed on Pages 28 to 30, inclusive, with the details by locations by years.

On Page 31 is shown the summary of reproduction cost of Account 353, Mains, and on Pages 32 to 37, inclusive, the details by years are shown.

On Page 38 is shown the summary of reproduction cost of Account 354.1, Compressor Station Equipment, which is followed by details by location by years running through to Page 58.

Page 59 shows the reproduction cost of Account 354.2, Measuring and Regulating Station Equipment, and Pages 60 to 64, inclusive, show the reproduction cost of general equipment such as office furniture and fixtures, transportation equipment, stores equipment, and tools and work equipment, some parts of which were not subjected to trending because of the smallness of the amount involved and also because of the multitude of items included in the various groups.

Trial Examiner: You have made reference at several points in both Exhibits 82 and 83 for identification, to certain account numbers. To what system of accounts are you referring?

The Witness: As I understand it, those account numbers are the Federal Power Classification.

[fol. 1758] Q. Mr. Haberly, have you prepared an exhibit applying to the reproduction cost new as set forth in Exhibit No. 83 condition percents as determined by you in Exhibit 82, by Mr. Lehn in Exhibit 80 and by Mr. Riddle in Exhibit 81? A. I have.

Q. I show you an exhibit marked "Michigan Gas Transmission Corporation—Reproduction Cost New Less Depreciation as of June 30, 1941 (Exclusive of working capital; materials and supplies, cost of developing business, or going value)", and ask you if this was prepared by you or under your direction? A. It was.

* * * * * * *

(The document referred to was marked Exhibit No. 84 for identification.)

[fol. 1759] Mr. Littman: Mr. Examiner, in order to keep the record straight, we at this time note an objection to the exhibit in so far as it relates to reproduction cost new and reproduction cost new less depreciation and object to any and all testimony with respect to reproduction cost and with respect to this exhibit.

Mr. Lee: In behalf of the Petitioner, your Honor, I desire to make the same objection as stated by the Commission counsel, Mr. Littman.

* * * * * * * *

[fol. 1760] Mr. Baldridge: Might I ask, Mr. Examiner, whether these objections made to this proposed Exhibit 84 go to the matter of condition percent; in other words, the percentage of depreciation?

Mr. Littman: You already have those condition percent in your Exhibit No. 82, in part, and I think, in Exhibit 81.

Mr. Baldridge: Yes, that is true, Mr. Littman.

Mr. Littman: So that your column in Exhibit 84 labeled "Percent Condition" is purely a duplication of what is already included in three previous exhibits, is it not?

Mr. Baldridge: This may be a situation in which it might help to clarify the record, if I may state the position I think you are taking, that you are not objecting to the

testimony on condition percents but only to any figures which tend to show the reproduction value new.

Am I correct in stating your position correctly for you?

Mr. Littmann: I will state at this time we are not making any objection to the testimony respecting condition percent or percent condition, but our objection goes to reproduction cost new and goes to reproduction cost new less depreciation.

[fol. 1761] Mr. Baldridge: Yes. Is that your position, too, Mr. Lee?

Mr. Lee: Yes, sir.

Mr. Baldridge: Thank you.

Trial Examiner: I think it was made clear in the consideration of objections to other pending exhibits that the Petitioner and Commission counsel, I believe both, recognized that the defendant company is entitled to introduce the evidence of depreciation but is objecting to the depreciation estimated on a basis of reproduction new.

Mr. Lee: That is right.

[fol. 1762] By Mr. Porritt:

Q. Mr. Haberly, will you briefly describe this exhibit?

A. Page 1 of the exhibit is a summary showing, in two adjacent columns, the reproduction cost new as of June 30, 1941, and the reproduction cost new less depreciation as of the same date.

The reproduction cost new is the same as that shown in Exhibit 83 for the total gas plant property exclusive of working capital, material and supplies, cost of developing business or going value.

On Pages 2 through 8, the condition percents as determined in my Exhibit 82, have been applied to the structures, measuring and regulating station equipment and general equipment. Condition percents as determined by Mr. Riddle and as set forth in Exhibit 81 have been applied to the mains and the condition percents as determined by Mr. Lehr set forth in Exhibit 80 have been applied to compressor station equipment exclusive of the cooling towers

and the elevated water tanks. Condition percents for these last two items were determined by me as shown in my Exhibit 82.

This exhibit, that is, Exhibit 84, is nothing more than a bringing together of the condition percents as determined by Mr. Riddle, Mr. Lehi and myself and applying them to [fol. 1763] the reproduction cost new as set forth in Exhibit 83.

Mr. Lee: Would those condition percents have the same application, as far as the percentage is concerned, to original cost as they do to reproduction cost?

. . . . . .

The Witness: They would, for all practical purposes.

However, if conditions for individual items were applied to the original cost figures in the same manner as they have been in Exhibit 84, the over-all resulting condition percent would be slightly higher, due to the fact that the property having the lower conditions has the lower original cost and thus these low conditions would receive somewhat less weight.

Such change would, however, be negligible.

Mr. Littman: Mr. Examiner, in view of that statement, I would like to state that we have no objection to the percent condition figures shown in the column in this exhibit labeled, "Condition Percent."

By Mr. Porritt:

Q. What are the percent conditions by accounts?

A. For organization, Miscellaneous Intangible Plant, Land and Land Rights—100 percent;

For Pumping Station Structures—96.38 percent;

For Measuring and Regulating Station Structures—[fol. 1764] 94.72 percent;

For Other Transmission System Structures—93.22 percent;

For Mains—97.79 percent;

For Pumping Station Equipment—96.72 percent;

For Measuring and Regulating Station Equipment—92.77 percent;

For Other Transmission System Equipment—98 even;

For Office, Furniture and Equipment—78 percent even;

For Transportation Equipment—71 percent even;

For Stores Equipment—90 percent even;

For Tools and Work Equipment—79 percent; and

For Construction Work in Progress—100 percent, the weighted average of which is—97.47 percent.

Mr. Culton: May I ask a question there.

These percentage items which you have given for the different account numbers, are these weighted figures?

The Witness: They are, sir.

Mr. Culton: In other words, in your Exhibit 84, you have separated the various percentages which together weight into the percentages which you have just read?

The Witness: That is correct.

By Mr. Porritt:

Q. Mr. Haberly, have you seen a proposed exhibit by Mr. Spitznagle using these percent conditions and are they [fol. 1765] correctly stated therein? A. They are.

. . . . . .

Q. Mr. Haberly, were you asked to prepare an exhibit setting forth the average age, probable remaining life and estimated salvage value of the short lived property, such as the furniture and fixtures, transportation equipment, stores equipment and the tools and work equipment?

A. I was.

Q. I show you an exhibit labeled "Michigan Gas Transmission Corporation, Average Age at June 30, 1941, Estimated Remaining Life and Estimated Salvage Value of Short Lived Property", and ask if this was prepared by you or under your direction? A. It was.

. . . . . .

(The document referred to was marked Exhibit No. 85 for identification.)

* * * * * * * *

[fol. 1766] A. The exhibit shows, opposite the various classes of short-lived property, first, the original cost of such short-lived property; second, the condition percent; third, the average age at June 30, 1941; fourth, the estimated remaining life as of the same date; and fifth, the estimated salvage in dollars. With the exception of the original cost and the average age, all of the figures are judgment figures.

Q. Are the percent conditions as shown in this exhibit, the same as you determined in Exhibit 82, labeled "Accrued Depreciation"?

A. They are. However, as can be seen from the exhibit, a separate condition percent is shown for the computing and adding machines under the general heading of "Furniture and Fixtures" and four separate condition percents are shown for the four classifications of Transportation Equipment.

These percent conditions are from the details by which the condition percents as shown in Exhibit 82 were built up and are, therefore, a further breakdown of the conditions as shown in Exhibit 82.

Only such property has been included in the calculations in this exhibit as will, in my opinion, have average lives of less than 25 years.

* * * * * * * *

[fol. 1767] Mr. Littman: Mr. Haberly, I would like to ask whether the amounts that you have included under the caption, "Salvage Value" are the amounts that might be expected to be recovered by way of salvage today?

The Witness: Yes, I believe that that would be the salvage which could be obtained today.

* * * * * * * *

The Witness: I may have answered the previous question incorrectly. The salvage value shown in the last column is the salvage value which I estimate could be received at the end of the remaining life.

That is, in connection with the computing and adding machines, four years hence.

. . . . . .

[fol. 1791] Trial Examiner: Consideration will be given at the proper time.

May I call your attention, gentlemen, at this time to page 1251 of the transcript in which you may recall the motion to strike the testimony with reference to reproduction cost and to exclude the proposed exhibits offered by Panhandle Eastern relating to reproduction cost and collateral subjects. The objection was pending and the Trial Examiner invited a statement from the attorneys for the Panhandle Eastern.

We have gone far enough in the record now with reference to the Michigan Gas Transmission Corporation so that I desire now to request counsel for the Michigan Gas Transmission Corporation at the proper time to make some statement in the record and I am quoting from the statement I made when the matter was before you at that time, shown in the transcript at page 1251.

I would like to have you point out on the record what peculiar facts are present in this particular proceeding as it affects your company which would take this proceeding,—as it affects the Michigan Gas Transmission Corporation,—out of that category. Now, the Commission in the case of the Chicago District Electric Generating Company and the opinion of the Commission, after the hearing concerning that company, referred to it in its opinion as a normal proceeding, a normal rate case.

[fol. 1792] You gentlemen representing the Michigan Gas Transmission Corporation were silent when Mr. Wheat was making his statements on this objection and if Commission's counsel have anything to add to what they have said on this question, they will have an opportunity, also, but their statement was quite complete, whereas you gentlemen have not had the opportunity to present such statement as you might wish considered bearing on this matter of the exclusion of reproduction cost, so we will give you an opportunity sometime after today, tomorrow before you rest your case, to make such state-

ment as you wish before there is any ruling. That is merely in order that you may have the fullest opportunity to present your views and make such statement as would differentiate this case.

The references to the pages in the record which you have will refresh your recollection as to the considerations which were then stated by counsel and remarked upon by the Trial Examiner.

* * * * * * * *

[fol. 1799] By Mr. Porritt:

Q. Mr. Haberly, have you been asked to prepare an exhibit showing the major items of materials and supplies restated at prices as of June 30, 1941?

A. I have.

Q. Did you make such a calculation? A. Yes, I did.

Q. I show you an exhibit labeled "Michigan Gas Transmission Corporation, Materials and Supplies, Restatement of Cost of Major Items at Prices as of June 30, 1941" and ask you if this was prepared by you or under your direction?

A. It was.

* * * * * * * *

(Document referred to was marked Exhibit No. 87 for identification.)

* * * * * * * *

[fol. 1801] Mr. Littman: We object to Exhibit 87 for the reasons already stated, that this is a reproduction estimate of the materials and supplies on hand rather than the actual cost of the materials and supplies on hand.

* * * * * * * *

Mr. Lee: Well, but, Mr. Porritt, the point I would like to get clear, I don't want to hold you up, but I think this is of great importance. You have simply repriced the materials and supplies that you had on hand, as I understand it, June 30, 1941, and you have given the original book costs and you have given the repricing cost which, in effect, is the reproduction cost.

Mr. Porritt: But in the working capital structure, Mr. [fol. 1802] Lee, is the amount of money that is necessary,

working capital as applied to the materials and supplies. There is a constant turnover and the amount of money that is required in working capital to keep constantly replacing those articles is the amount that is set forth in the last column.

Mr. Lee: Yes, but nevertheless it is predicated upon the original costs thereof as of the same date that you reprice them and I contend that in effect it is subject to the same objections which have been made by counsel for the Commission in which we have joined and we again join in this present objection.

Trial Examiner: Of course, we must all recognize the distinction that the working capital account is not a part of fixed capital.

* * * * * * * *

[fol. 1803] By Mr. Porritt:

Q. Mr. Haberly, will you explain this exhibit?

A. I was furnished a list of the major items of materials and supplies indicating the date of purchase of the various items and the original cost of such purchases. These original costs are shown in the first column of figures as set forth on pages 2 to 8, inclusive, of the exhibit, in each case opposite the description of the material.

I applied indexes to the original costs of the various items in order to restate such original cost in terms of [fol. 1804] cost of June 30, 1941. In several instances no indexes were available reflecting the change in price of individual items, and these items were carried over at their original cost.

Page 1 of the exhibit shows a summary of the materials and supplies which have been restated in terms of present cost. The first column of figures in the summary shows the total cost of materials and supplies per books as of June 30, 1941. The second column of figures shows the book cost of those materials and supplies to which present costs were applied. The third column shows the percentage of the cost of materials and supplies so handled. The last column shows the result of applying indexes to the book costs as shown in the second column.

The exhibit indicates that if $54,211 worth of materials and supplies, as shown in column 2 on page 1, had been purchased at prices current June 30, 1941, they would have cost $61,522 or an increase of $7,311 over their original cost.

* * * * * * * *

[fol. 1805] Mr. Lee: But under that supposition, what you have done is that you have valued that simultaneously as of June 30, 1941, valued it for the original cost simultaneously with the advance cost.

The Witness: I have applied an index to the original cost so as to restate that original cost at present cost, yes, sir.

Mr. Lee: So, in effect, the characterization of your second column is original cost which, in effect, amounts to carrying out the same theory of reproductive cost in your other exhibits.

The Witness: It does state the cost of replacing the item as of June 30, 1941.

* * * * * * * *

[fol. 1807] Mr. Culton: I think probably I can clarify one or two things. These items and the totals of which are shown on the first column on page 1 are all items which are not in the plant account, are they not?

The Witness: That is correct.

Mr. Culton: They are all excluded from the ordinary plant account?

The Witness: They are carried as materials and supplies.

Mr. Culton: And none of it has gone into the physical construction of the line? None of these items?

The Witness: It had not gone in as of June 30, 1941.

Mr. Culton: Now, you did not attempt to determine the present cost of all material of that type, did you?

The Witness: No, only 58 percent of it, larger items.

Mr. Culton: Then, to get what the present value would be of all of the materials and supplies, you would have to

add the difference in the cost of that 58 percent to the total shown in the first column, would you not?

The Witness: Yes, that is correct.

. . . . . .

[fol. 1809] Trial Examiner: Are there any questions by way of cross-examination at this time?

Mr. Littman: Yes, I have one or two.

Mr. Haberly, what is the amount that you are claiming here for materials and supplies? Which one of these figures are you relying on?. I would like to have the amount.

[fol. 1810] The Witness: I think that the use that is going to be made of this figure is to take the $93,413 shown on page 1 of Exhibit 87 and add there to the difference between column 4 and column 2, which is $7,311, which will result in total materials and supplies of approximately $100,000.

Mr. Littman: I see. Well now, one question about this broken valve that you and Mr. Lee discussed a moment ago. When that broken valve is replaced, at what amount is it replaced or at what cost is it replaced insofar as the plant accounts are concerned?

The Witness: It would probably go into the plant account at the cost at which it stands in materials and supplies if any change is made in the property account by virtue of the replacement.

Mr. Littman: You mean at the original cost?

The Witness: Yes.

. . . . . .

[fol. 1811] Mr. Littman: May I ask one question?

You used the term "original cost" in a number of your exhibits, Mr. Haberly. Are you referring there to book cost?

The Witness: Yes.

Mr. Littman: That is, there are no changes from the costs as they appear on the company's books?

The Witness: As I have obtained the figure from the books of the company myself or as it has been furnished to me from the books.

* * * * * * * * *

FRED A. SPITZNAGLE was called as a witness on behalf of Michigan Gas Transmission Corporation and being first duly sworn, was examined and testified as follows:

* * * * * * * * *

By Mr. Porritt:

* * * * * * * * *

My name is Fred A. Spitznagle. My business address is 327 South LaSalle Street, Chicago, Illinois.

[fol. 1812] Q. By whom are you employed and in what capacity?

A. Central Service Corporation, in the capacity of an accountant.

Q. Has Central Service Corporation been employed to advise and assist in the preparation of the data and evidence submitted by Michigan Gas Transmission Corporation in this case? A. They have.

* * * * * * * * *

Since attending high school for a period of about three and a half years, I have been continuously employed, except for a period of about two years, for 28 years in the public utility industry.

During this entire period I have been a student of all phases of accounting and taxation relating to the public utility industry.

During the period 1911 to 1918, I was employed by the Springfield Gas & Electric Company, Springfield, Illinois. When leaving this company I was chief clerk of the customers' accounting and complaint departments.

During the period 1918 and 1919, I attended the United States School of Military Aeronautics at the University of Illinois. I was commissioned a Second Lieutenant in the United States Air Service in August 1918. I resigned my [fol. 1813] commission in July 1919 after service in France.

During a period in 1919 I was employed by the Rockford Interurban & Street Railway Company in the capacity of assistant cashier.

During the period 1919 to 1924, I was employed in the capacity of auditor by the Indiana Power Company, Consumers Power Company and Knox and Sullivan County Light & Power Company, associated companies all operating in the same general territory in the State of Indiana.

During the period 1924 to 1937 I was employed as an accountant in the system of Utilities Power & Light Corporation, performing under the direction of a senior accountant or financial officer a large number of the duties hereafter detailed by me except the giving of testimony at hearings before the Federal Power Commission or State Public Utility Commissions.

During the period 1938 to date, I have been employed by Central Service Corporation to advise with and assist the management of client utility companies, counsel for the said companies and the management and other specialized departments of Central Service Corporation on the following matters, including the giving of testimony regarding financial and other fact statements prepared by me or under my supervision at hearings before the Federal Power Commission, Securities and Exchange Commission and other Government authorities:

[fol. 1814] General and commercial accounting practices; accounting procedures and methods; applications to the Federal Power Commission for sale of electric utility property; original cost studies required pursuant to order of the Federal Power Commission; Federal Power Commission annual reports; registration statements filed with the Securities and Exchange Commission for the sale of securities; annual periodical reports, applications and declarations prescribed by the Securities and Exchange Commission pursuant to the Securities Act of 1933 and 1934, and the Holding Company Act of 1935; applications to State authorities under State Blue Sky laws and to qualify securities as investments for savings banks and other State institutions; Federal and State tax returns, deficiency and other tax assessments and prosecution of protests to said deficiencies and other tax assessments;

financial statements and studies of the past, current and future operating results, fixed capital expenditures, working and other capital requirements.

* * * * * * * * *

Q. Have you prepared or had prepared under your supervision for introduction in this proceeding a number of exhibits? A. Yes; I have.

Q. Were such exhibits prepared from the books of [fol. 1815] account and records of the Michigan Gas Transmission Corporation?

A. They were so prepared and were based on explanations furnished by officers of the company, but no detail audit was made by me or anyone employed under my supervision of the books of accounts and records of the subject company.

Q. In your subsequent testimony regarding the exhibits your answers to the two preceding questions will relate to each such exhibit insofar as such exhibits contain information taken from the books and records of the subject company unless otherwise stated by you?

A. That is correct.

Q. Mr. Spitznagle, I hand you an exhibit entitled "Comparative Balance Sheet Per Books." Does this exhibit correctly show what it purports to show?

A. It does.

* * * * * * * * *

(Document Referred To Was Marked Exhibit No. 88 For Identification.)

* * * * * * * * *

[fol. 1816] A. Exhibit No. 88 shows as at December 31, 1936 to 1940, inclusive, and as at June 30, 1941 condensed balance sheets containing classified assets and liabilities of the Michigan Gas Transmission Corporation.

The assets are shown on page 1 and the liabilities on page 2.

Q. Referring to the item on page 1, classified as "Contractual Loans in Aid of Construction Made to Customers," what does this item represent?

A. Such item represents repayable loans which were made by Michigan Gas Transmission Corporation to distribution customers to extend the customers' natural gas service, thereby increasing gas sales of the Michigan Gas Transmission Corporation.

Q. You meant distributing customers, did you not?

A. That is correct, distributing customers.

Q. Referring to the item on page 1, classified as "Accounts Receivable, Customers' Service, etc.," what, besides receivables due from customers of Michigan Gas Transmission Corporation is contained in this item?

A. Michigan Gas Transmission Corporation under its transportation contracts with Panhandle Eastern bills and collects for gas delivered to customers of Panhandle Eastern, therefore, the amount due from such customers [fol. 1817] of Panhandle Eastern and payable to the latter is included for convenience in this item with an offsetting amount classified on page 2 as "Accounts Payable, Panhandle Eastern Pipe Line Company."

In addition, the amounts shown include minor other receivables, small amounts of expense advances and small loans and receivables due from employees.

Q. Referring to the item on page 1 classified as "Preliminary Survey and Investigation Charges," what does this item represent?

A. This item represents expenses incurred when investigating the feasibility of construction projects. When the project is approved and started, the amounts so classified are eventually classified in "Utility Gas Plant."

Q. Referring to the item on page 1 classified as "Deferred Sales Promotion Expense," what does this item represent?

A. The amount of $56,167 in the column headed "1937" represents grants made to distributing customers of Michigan Gas to assist such customers in meeting the expense of changing over from artificial to natural gas.

The amount of $3,374.07 appearing in the column headed "1939" represents Michigan Gas Transmission Corporation's portion of a like grant made to a Panhandle Eastern customer.

These items were charged to expense in the respective years 1938 and 1940.

[fol. 1818] Q. Referring to the item on page 1 classified as "Contingent Sales Promotion Expense." What does this item represent?

A. This item as set up on the books of the company is offset by the item on page 2 classified as "Contingent Liability for Conversion Costs—Contra." It is so treated as a convenience in keeping a record of items of this character which may become actual liabilities in the future. This item alludes to certain contractual discounts provided to assist distributors of natural gas.

Q. Referring to the item on page 1 classified as "Other Deferred Debits," what does this item represent?

A. The amount of $9,902.47 in the column headed "1937" represents legal expense in connection with contracts for delivery of natural gas to Ann Arbor, Michigan of $8,849.09 of which a portion was charged to expense in a subsequent period and a portion billed to Panhandle Eastern. The balance of $1,053.38 represents the cost of installing drips on transmission mains and was subsequently transferred to "Gas Utility Plant."

The amount of $18,042.29 in the column headed "1938" represents legal expense of $12,875.58, including the aforesaid $8,849.09 in connection with the contract for delivery of gas to Ann Arbor. The entire amount was subsequently treated as previously explained.

[fol. 1819] The balance of $5,166.71 represents expenditures incurred for measuring equipment and grading and so forth at compressor station site which was subsequently charged to "Utility Gas Plant."

Q. Now, referring to the item on page 2 classified as "Contingency Reserves", for what purpose was this reserve provided?

A. This reserve was provided to take care of possible additional assessments for Federal income tax for the years 1934 to 1939, inclusive, and interest thereon, based on deficiencies proposed by the Bureau of Internal Revenue with respect to some past years.

Q. Referring to the item on page 2, classified as "Other Deferred Credits," what does this item represent?

A. The amount appearing in the column headed "1936, 1939 and June 30, 1941" represents credit balances in auto-

mobile and miscellaneous clearing accounts. In subsequent periods these amounts were credited to like expenses which were cleared to various operating and construction accounts.

In the amounts appearing in the columns headed "1937" and "1938" there was $553.09 and $1,711.58, respectively, representing credit balances in the aforesaid clearing accounts and were subsequently treated as explained. The balance of the respective 1937 and 1938 amounts represents an estimated credit that was due Michigan Consolidated [fol. 1820] Gas Company of $30,006.72 in connection with gas billings for the contract year ended March 31, 1938 and a payment of $13,013.76 made by Panhandle Eastern for its share of sales promotion expenses subsequently paid out by Michigan Gas Transmission Corporation under contracts to distributing customers.

. . . . . .

[fol. 1821] (Exhibit No. 88 Marked For Identification, Was Received in Evidence.)

By Mr. Porritt:

Q. I hand you herewith an exhibit titled, "Earned Surplus Per Books", and ask that that be marked Exhibit No. 89 for the purposes of identification.

. . . . . .

(The Document Referred To Was Marked Exhibit No. 89 For Identification.)

. . . . . .

A. Exhibit 89 details, by years, for the period March 1, 1936, to June 30, 1941, and for the twelve months ended June 30, 1941, all transactions recorded in the earned surplus account of the company.

The items, as detailed in this statement, I believe, are self explanatory.

. . . . . .

[fol. 1822] (Exhibit No. 89 For Identification Was Received in Evidence.)

Q. Mr. Spitznagle, I hand you an exhibit titled, "Capital Surplus", and ask that this be marked Exhibit No. 90 for purposes of identification.

(The Document Referred To Was Marked Exhibit No. 90 For Identification.)

A. Exhibit 90 shows, for the period March 1, 1936, to June 30, 1941, by calendar years, and the twelve months ended June 30, 1941, all transactions recorded by the company in its capital surplus account.

Q. Under the column headed, "1939", is an amount of $139,500. What does this item represent?

A. In the year 1939, I understand that the Columbia Gas & Electric Corporation restated on its books its investments in and loans to various companies, and that in [fol. 1823] connection with such restatement waived $139,500 due from Michigan Gas Transmission Corporation, thereby effecting a contribution to capital of Michigan Gas.

(Exhibit No. 90 For Identification Was Received In Evidence.)

Q. Mr. Spitznagle, I hand you an exhibit titled, "Preliminary Report on Original Cost Studies by Central Service Corporation" consisting of 27 pages, and at this time I would like to have this exhibit marked Exhibit No. 91 for purposes of identification.

(The Document Referred To Was Marked Exhibit No. 91 For Identification.)

Q. What information does your preliminary report on the original cost studies offered as Exhibit 91 show, and is the information submitted sufficient to advise the Federal Power Commission as to the original cost of the Utility Gas Plant of Michigan Gas Transmission Corporation?

[fol. 1824] A. We believe the information submitted is sufficient for the purpose you have just stated in your question.

This report is, to a large degree, self-explanatory, and has been made in accordance with paragraph 2, instructions for gas plant accounts, contained in the Federal Power Commission classification of accounts and prescribed for use by them as at January 1, 1940, but I will run through the report and outline, in a general way, the information it contains.

Pages 1 to 3, inclusive, contain a description of the books and records maintained by Michigan Gas and its predecessor and associated companies, in relation to the cost of the utility gas plant of Michigan Gas Transmission Corporation.

Pages 3 to 8, inclusive, detail the scope of our examination of the original cost studies conducted by the Company along with other related information.

Pages 9 and 10 contain a list of statement submitted in the report, namely, Statements A to I, inclusive.

Statement A, pages 11 to 14, inclusive, contains an outline of the origin and development of Michigan Gas Transmission Corporation.

Statement B, page 15, details for each acquisition by Michigan Gas and its predecessors, the original cost, the cost to the acquiring company, and the amount entered on the books of the acquiring company, of gas utility property acquired as an operating unit.

[fol. 1825] Statement C—none is included because as indicated in the index to these statements, none is required, in that the Utility Gas Plant of Michigan Gas does not contain any amounts arrived at by appraisal.

Statement D, page 16, contains the classified utility gas plant of Michigan Gas at January 1, 1940, and June 30, 1941, both immediately prior to reclassification of such utility gas plant in accordance with the system of accounts prescribed by the Federal Power Commission.

Statement E, page 17, contains a summary of the adjustments, subject to the comments on the bottom of that page, necessary to state as of January 1, 1940, the amount includible in Account 100, Utility Gas Plant.

Statement F, pages 18 and 18a, contains a classified statement of amounts includible in Account 100, Utility Gas Plant, as at January 1, 1940, and June 30, 1941, in accordance with the classification of accounts prescribed by the Federal Power Commission. There is also shown, in summary form, the ascertained overheads included in the original cost of utility gas plant.

Statement G, page 19, contains a balance sheet as at January 1, 1940, of Michigan Gas classified to show the utility gas plant before and after reclassification pursuant to instructions of the Federal Power Commission.

Statement H, page 20, does not contain the information called for but contains an explanation as to why such [fol. 1826] information is not presently available.

Statement I, pages 21 to 27, inclusive, details certain statistical information relative to the gas plant of Michigan Gas at June 30, 1941.

Q. Mr. Spitznagle, when is the original cost study of the Company required to be filed with the Commission?

A. It is required to be filed, pursuant to instructions of the Commission, not later than two years from the effective date of such instructions. The instructions were effective January 1, 1940, therefore the original cost study is due January 1, 1942, or sooner.

Q. Has Michigan Gas completed their original cost study?

A. The original cost study of Michigan Gas Transmission Corporation is not entirely completed, but is very near completion.

Q. Do your investigations indicate that the company's original cost studies, when completed, will coincide very closely with your exhibit No. 91?

A. It is my opinion that it will.

. . . . . .

[fol. 1828] (Exhibit No. 91 For Identification Was Received In Evidence.)

. . . . . .

[fol. 1837] By Mr. Porritt:

Q. Mr. Spitznagle, I hand you exhibit titled, "Original [fol. 1838] Cost Depreciated", and ask that that exhibit be given No. 92 for the purposes of identification.

Trial Examiner: It will be so marked.

(The Document Referred To Was Marked Exhibit No. 92 For Identification.)

* * * * * * *

Exhibit 92 shows, in the first column, the classified original cost of Utility Gas Plant of Michigan Gas, as reclassified in our Exhibit 91, "Preliminary Report on Original Cost Studies" and is subject to our comments contained in such "Preliminary Report."

The second column contains the percent condition of the classified utility property as determined by Messrs. Riddle, Lehn and Haberly, engineers employed to make such determination.

The third column shows the original cost amount of the classified items depreciated to the percent conditions shown in the second column.

The fourth column shows amount of observed depreciation for each classified item determined by the difference between the amounts in columns 1 and 3.

* * * * * * *

[fol. 1839] Q. Mr. Spitznagle, I hand you an exhibit titled "Statement of Contributions Made to Customers for Business Development" and ask that this exhibit be marked No. 93 for purposes of identification.

* * * * * * *

(The document referred to was marked Exhibit No. 93 for identification.)

* * * * * * *

A. Exhibit 93 contains the amount of all contributions made prior to the enactment of the Natural Gas Act by Michigan Gas to its customers and those of Panhandle Eastern and to whom Michigan Gas Transmission Corporation delivers gas, and does not reflect any portion of

such contributions made to the same customers by Panhandle Eastern.

At some points in my testimony these contributions are referred to as "grants." This exhibit lists each contribution made during the period 1936 to May 31, 1938, the [fol. 1840] Company to whom made and the amount contributed to the respective companies by Michigan Gas Transmission Corporation.

Q. You mean, Mr. Spitznagle, that all contributions made prior to the effective date of the Natural Gas Act, do you not? A. That is correct.

. . . . . .

Mr. Lee: I understand, Mr. Witness, that those contributions have ceased since the effective date of the Natural Gas Act?

The Witness: No, sir, they have not.

Mr. Lee: Why did your exhibit limit them to the effective date of the Natural Gas Act?

The Witness: Because this information is to be used in the rate base of the company and, pursuant to advice of counsel, it is believed that payments made subsequent to the enactment of the Natural Gas Act should not be included.

Mr. Littman: All of this money that you have listed in Exhibit 93 has been charged to the operating expenses of Michigan Gas Transmission Corporation in the past, hasn't it?

The Witness: That is correct. The exhibit indicates that in the heading there.

Mr. Littman: I take it that this exhibit was prepared as the basis for some form of going concern value, was it not?

The Witness: Yes.

[fol. 1841] Mr. Littman: It furnishes a basis?

The Witness: The cost of developing the business.

Mr. Littman: We object to Exhibit 93 for reasons stated at numerous times on the record. It is the basis of a claim for going concern value which is, of course, part and parcel of reproduction cost.

Mr. Lee: On behalf of the Petitioner, City of Detroit, I desire to concur and join in Mr. Littman's objection.

• • • • • • • • •

Mr. Porritt: This is money that was actually paid out by the company and as such—

Mr. Baldridge: (Interposing) May I complete that statement?

Mr. Examiner, this was money paid to customers. It was charged to operating expenses. If that had not been done, that additional amount of money would have been available for distribution.

This was all done at a time when the company was not subject to regulation. It was not a public utility and it could earn whatever it wanted and distribute whatever it wanted as it saw fit.

Now, the fact that it has elected to take money which it [fol. 1842] might otherwise have distributed to put it into the development of future business, that should entitle that company to recognition of that fact. That is an actual investment which it made in future business and, if it had not done that, it would not have been able to acquire certain of these contracts and to serve gas in certain communities where it is now being served.

I should restate that a little bit. It would not have been in a position to sell and would not now be selling gas to distributing companies which, in turn, supply their consumers in various communities.

With that in mind, I think that we can fairly say that this particular claim for business development or going concern value—I do not think the term makes much difference—has no relation whatsoever to reproduction value.

It is based on original cost. It is based on actual dollars that were taken out of the company's pocket and put into the pockets of distributing companies for the purpose of

developing its business in the future and without those contributions, it would not have been able to develop that business.

Trial Examiner: Was Mr. Littman correct in assuming that this proposed exhibit is for the purpose of developing some claim for going concern value?

Mr. Baldridge: Going concern value is again perhaps a term we might not use. It is certainly for the purpose of showing what the company has actually spent in de- [fol. 1843] veloping its business and it is an expenditure that has been made as truly as any expenditure for pipe or for compressor stations.

We do intend to put these expenditures into our rate base. We think we are entitled to do so.

Trial Examiner: Even if they have heretofore been charged to operating expense?

Mr. Baldridge: Let me again make this distinction clear, Mr. Examiner. It seems very clear to us.

We have not attempted to add to this figure any dollars contributed in this way after this company became subject to regulation. Before the enactment and effective date of the Natural Gas Act; a gas company of this kind was just another commercial enterprise and, like an oil company or any other company, it had a right to do as it liked with the money it earned and it could earn as much as economic circumstances and competition and other factors would permit.

Now, these expenses, or these moneys, were spent in those unregulated days, and I submit that there is no reason at all why the company should not now be allowed to add to its rate base something which amounted to an investment at that time.

If it had taken the equivalent amount of dollars out of moneys available for distribution to security holders and invested them in pipe or compressor stations, that would surely have been an element that would have been considered in making a rate today. It would be an actual investment.

[fol. 1844] Now, this investment was just as actual and just as sound and, I may add, considering the business as a whole, just as necessary.

* * * * * * * * *

[fol. 1846] Mr. Littman: The United States Supreme Court, of course, has passed on this subject in the Columbus Gas & Fuel case and the Dayton case, a copy of which opinions I am sorry I do not have with me at present. [fol. 1847] I thought I had copies of those opinions with me in my brief case, but I have not:

But Justice Cardozo, in those cases, rejected this kind of evidence as a basis for a claim for separate allowance for going concern value.

He rejected it on the ground that these costs had been incurred in years gone by and had all been charged to past operating expenses and that this type of proof was insufficient.

The Supreme Court, of course, has, on a number of occasions, refused to make a separate allowance or to permit a separate allowance to be made for going concern value.

This Commission has refused to make a separate allowance for going concern value. What will happen to the decision rendered by the Circuit Court of Appeals in the Natural Gas Pipe Line case, of course, I do not know. It is now pending before the Supreme Court of the United States.

However, I not only believe that this testimony is wholly incompetent as a basis for any claim for going concern value even if going concern value was to be permitted in this case as a separate allowance, because the United States Supreme Court has time and again held that past operating expenses cannot even be used as a guide for the purpose of an inclusion of a given amount as a separate allowance for going concern value, so it is not only incompetent, but it also forms an integral part of reproduction cost.

[fol. 1848] As a matter of fact, Mr. Biddison had a similar study in his Exhibit 39 and was frank enough to refer to it

as "reproduction cost", that is, it was one of the pages in his total exhibit and he frankly referred to it as "reproduction cost."

It is the cost which they would expect a purchaser to pay for their property if it were sold today and if it were reproduced today. It is all a part of reproduction cost as we understand it.

. . . . . .

[fol. 1852] By Mr. Porritt:

Q. Mr. Spitznagle, I have an exhibit titled, "Working Capital as of June 30, 1941" and ask that that so-titled exhibit be marked No. 94 for the purposes of identification.

. . . . . .

(The document referred to was marked Exhibit No. 94 for identification.)

. . . . . .

A. Page 1 of Exhibit 94 shows the reasonable amount of working capital required by Michigan Gas in the conduct of its business by summarizing the information and data detailed on pages 2 to 7 inclusive of this exhibit.

The total amount of working capital thus shown is $300,147.08 as at June 30, 1941.

Page 2 of Exhibit 94 shows the computation of the $47,175.05 included in working capital for cash fund op-[fol. 1853] erating expenses determined on the basis of the monthly average of certain pro forma operating expenses, for the twelve months ended June 30, 1941, for which working capital was employed for an estimated period of 45 days.

In making this determination, as shown on this page of this exhibit, the cost of purchased gas, amounts charged to income for taxes, amount of prepayments charged to income, and depreciation or amortization charged to income have all been excluded from operating expenses.

Page 3 of Exhibit 94 shows data with respect to the $100,723.78 included in working capital for material and supplies required to be kept on hand by the Company.

There is detailed on this page the amount invested in material and supplies by the Company at the end of each month plus an estimated amount for future increased cost of a portion of the material and supplies carried on hand.

This information is shown for a period of 18 months ended with June 30, 1941. There is also shown the average amount for the 18 month period and for the last twelve months in said 18 month period.

The amount of estimated increased future costs of material and supplies is based on a determination, made by Francis S. Haberly, Engineer, submitted as Exhibit 87 in this case, of the cost of replacing at June 30, 1941 prices, only 58 percent of the material and supplies on hand at June 30, 1941.

[fol. 1854] It will be noted from the tabulation on this page that the amount of material and supplies on hand at the end of the respective months has increased from $58,959.83 at January 31, 1940, to $93,412.78 at June 30, 1941.

Such increase has been due to the need for additional material and supplies to meet the requirements of expanding operations in that period, and the need for protecting the company against the ever increasing difficulty occasioned by the defense activities of our National Government in securing prompt delivery of material and supplies.

Therefore, we estimate that the amount of material and supplies on hand at June 30, 1941, adjusted in part to the cost of replacing 58 percent of such material and supplies at June 30, 1941 prices, represents the amount of working capital reasonably required to be invested in material and supplies.

Page 4 shows a tabulation of the quantity of gas in the line pack of the company, its cost per therm, its aggregate value, the value capitalized and not capitalized, at the end of each month from July, 1940, to June, 1941, and the average amount of said items for the twelve-month period ended June 30, 1941.

Line pack is gas stored in the mains and the amount at the end of any month represents an investment in gas carried on hand.

We have included $31,406.70 in working capital for line pack which is the average value of such line pack, not capitalized and carried on hand at the end of each month in [fol. 1855] the twelve months period ended June 30, 1941.

Page 5 is a copy of a letter dated September 30, 1941, received by the company from the National Bank of Detroit and signed by Elbert S. Burns, Cashier, which states that the minimum bank balance which it will require of the company in connection with its accounts is $116,303. We have included this amount in working capital.

Page 6 details, by months, for twelve months ended June 30, 1941, the amount invested by the company in prepaid expense, including the average amount invested during such period. The average amount of $5,538.55 has been included in working capital.

Page 7 is factual data with respect to the Company's cash position and is presented by months for the twelve months ended June 30, 1941.

It shows that the company maintains eighteen separate accounts in the National Bank of Detroit, the aggregate of the cash balances carried in such accounts, and other pertinent data in support of the minimum cash requirement included in working capital.

* * * * * * * *

[fol. 1860] GEORGE S. YOUNG, a witness, having been previously sworn, resumed the stand, was examined and testified as follows:

By Mr. Porritt:

Q. Mr. Young, have you prepared or had prepared, a statement setting forth the "Estimated Cost of Completing the Work in Progress at June 30, 1941, and Estimated Gross Income to be Derived from the Projects when Completed?" A. I have.

Q. This document which I now show you, entitled "Estimated Cost of Completing Work in Progress at June 30, 1941, and Estimated Gross Income to be Derived from the Completed Projects" is the statement to which you have just referred? A. It is.

* * * * * * * *

(The document referred to was marked Exhibit No. 95 for identification.)

* * * * * * * *

A. Under Column A are listed the various projects [fol. 1861] constituting work in progress as of June 30, 1941.

In Column B are shown the estimates of the total expenditures to be made under each project.

In Column C are listed the total amounts expended under each project at June 30, 1941.

In Column D are listed the estimated amounts required to complete each project after June 30, 1941.

The amounts listed in Column D are differences between those amounts listed in Column B and Column C.

In Column E are listed the estimated increases in gross operating income before depreciation and Federal income tax to be derived from completed projects in the first year after the date of completion.

* * * * * * * * *

Mr. Lee: Is this gross income predicated upon existing contractual prices you receive for the delivery of the gas?

The Witness: Yes, it is.

I might add, in connection with that, that the only one of these projects which will reflect an increase in income is that on Line 13, pertaining to the Monroe measuring station.

Mr. Lee: Does this exhibit have any relation to any work in progress incidental to the new contract between [fol. 1862] Panhandle and the Consumers Power Company?

The Witness: No, sir, it does not.

Mr. Lee: That new contract between the Panhandle and Consumers Power Company will enhance your income, won't it?

The Witness: Yes, sir, it will.

Mr. Lee: But that is in no way reflected in this exhibit?

The Witness: It is not, no sir.

Mr. Lee: Then, do we understand that there is no expenditure necessary by your company in order to carry out the requirements of that contract?

The Witness: Yes, I would say that there will be expenditures necessary, but they have not been undertaken as yet.

Mr. Lee: That is what I wanted to get clear. There is no work being done or no expenditures incurred or contracts entered into that will result in expenditures with reference to the Consumers Power ~~contract with~~ the Panhandle Eastern Pipe Line Company?

The Witness: No, sir.

Trial Examiner: However, the proposed Exhibit 95 is a reflection of the status as of June 30, 1941, and not as of today?

Mr. Lee: That is right.

Trial Examiner: Any other questions, gentlemen?

Mr. Littman: Yes, I would like to ask Mr. Young to explain the method whereby he arrived at the figures shown in column E, entitled "Estimated gross operating [fol. 1863] income before depreciation and Federal income tax, to be derived from completed projects."

Can you explain, generally, how you arrived at those figures?

The Witness: Well, in the case of the first item, "Routine minor additions to transmission system property," the item under "B"—$27,057, is the amount in a blanket budget to cover minor additions to transmission facilities and would not result in any increase in revenue. The $270 which is marked as a red figure would be the amount of taxes and insurance to cover those additions in property.

. . . . . .

Mr. Littman: Will you explain the method whereby you arrived at the balance of the figures in that column?

The Witness: Well, the second item, "Routine minor additions to general property," I think is covered by

Note A at the bottom of the page there, in that the amount of taxes applicable to the additions would be negligible.

That item is intended to cover the additions to the office equipment and furniture, tools and working equipment, which might be purchased and which would not result in any increase in revenue.

The Witness: The third item, $75,174, is a carry-over [fol. 1864] budget from the 1940 construction of the 24-inch loop pipe line to cover the settlement with the contractor which was not made in the year 1940 and also to cover the installation of concrete gate boxes; which was not done until this summer.

The note at the bottom, with reference to that item and to another item, I think is self-explanatory. The $750 item represents again the taxes and insurance by reason of this increase in capital from which there is no increase in income.

The explanation of the item on Lines 8, 9 and 10, I think, is the same. It is covered by the note B. The Edgerton compressing station was put into operation in 1940. The work, however, was not entirely completed and the carry-over budget, in the amount of $25,271 was taken to complete that work.

The next item, the construction of the Bluffton warehouse, again the amount of $295 represents the increase in taxes and insurance by reason of that construction and there is no income increase as a result of that installation.

The next item covers the construction of the Monroe measuring station to deliver gas for the account of Panhandle Eastern Pipe Line Company. There is an increase of revenue in that case.

As I recall, that amounts to $7600 and the $6877 item is the amount after operating expenses of that measuring station and after taxes and insurance.

Mr. Littman: Doesn't the figure that you just named as [fol. 1865] increased revenue by reason of the installation of the measuring and regulating station near Monroe represent an allocation of some kind?

The Witness: No, we are being paid fixed rates for the transportation of gas to Monroe and, on the basis of our

estimate of the delivery for the year after the completion of the station, we can calculate the increase in revenue from that operation.

Mr. Littman: And your working papers show the details of that calculation, do they?

The Witness: Yes, they do.

I might add also, in that connection, that there is a figure included in operating expenses which was deducted from the $7,600 figure to cover the cost of pumping to this location when the gas is delivered at Monroe.

The next item, construction of the Elwood measuring and regulating station, would result in no increase in income. We have a contract with the Central Indiana Gas Company whereby we were obligated to build additional points of delivery for them.

They asked that we build the Elwood station and it does not mean that we would deliver any more gas to them. Therefore, there would be no increase in income and the $540 item represents again taxes and insurance.

The last item, installation of two additional units at the Edgerton compressing station will not result in any increase [fol. 1866] in income. Those two units are being installed there so that we can make anticipated deliveries of about 7 million feet per hour to Detroit and, at the same time, maintain the contract pressure when delivering 7 million cubic feet per hour rate which is at a rate of about 168 million cubic feet per day, whereas our obligation to deliver in 24 hours is limited to 125 million.

Mr. Littman: That installation is for the purpose of taking care of an increased load, isn't it?

The Witness: No, sir.

Mr. Littman: It is not?

The Witness: It is not. It is for the purpose of taking care of this high hourly rate of delivery. However, the total in the course of the day will still not be more than 125 million.

Mr. Goodman: In connection with the figures in Column E, do they reflect, in any way, any consideration of savings in operating expenses?

. . . . . .

The Witness: No, they do not.

. . . . . .

[fol. 1867] Mr. Goodman: Do you have engineering studies under which these particular expenditures are justified?

The Witness: Yes, in the case of the items covered on Lines 5, 6 and 7, 8, 9 and 10, and 13 and 14, we have made calculations to justify those expenditures.

. . . . . .

[fol. 1869] Mr. Lee: The exhibit that you have just offered, marked No. 95 for identification has to do, as I understand it, solely with work in progress and partial expenditures thereon, for construction necessary to carry out, in your judgment, existing contracts with customers.

The Witness: Yes, I would say that the one referring to expenditures applicable to construction of Edgerton compressor station, in 1940; the one referring to expenditures applicable to the 24-inch loop line construction in 1940 and the construction of the measuring and regulating station near Monroe and also the construction of the measuring and regulating station near Elwood, Indiana, and also the installation of two additional units at Edgerton compressing station, are in that category.

Mr. Lee: This looping, has the entire line been looped?

The Witness: The 20-inch line extending from the Illinois-Indiana State Line to a point near Zionsville, a distance of approximately 70 miles, has been completely looped with 24-inch pipe line.

At one river crossing, we have put in a multiple river crossing in the loop.

. . . . . .

[fol. 1870] By Mr. Porritt:

Q. Mr. Young, have you prepared an exhibit showing the estimated cost to the company of this proceeding going on before the Federal Power Commission? A. I have.

. . . . . .

(The Document Referred To Was Marked Exhibit No. 96 for Identification.)

. . . . . .

[fol. 1871] Mr. Littman: This is rate case expense. We would like to reserve an objection to this exhibit on the ground that rate case expenses are not to be considered in this case, at least for the purpose of testing the reasonableness of the present rates.

. . . . . .

Q. Mr. Young, did the Michigan Gas Transmission Corporation have any extraordinary or abnormal pipe line maintenance during the twelve months ending June 30, 1941?

A. Yes; in the amount of $4,572.92 to repair and reinforce a steep bank where a slip had occurred.

Q. Was the balance of the amount that was expended for pipe line maintenance during this period expended for ordinary maintenance? A. It was.

Q. Do you anticipate that larger expenditures will be required for extraordinary or abnormal pipe line maintenance during the life of the property? A. I do.

Q. What, in your opinion, constitutes extraordinary or abnormal pipe line maintenance?

A. [fol. 1872] Extraordinary or abnormal pipeline maintenance includes, in particular, the cost of: repair of large washouts caused by high water and heavy rains; repair of slips; repair of pipe line and river crossing breaks; the cost of applying cathodic protection where the nature of the soil and inspection of the pipe indicates that the pipe is being actively corroded and might corrode to a serious extent if anticorrosive measures are not taken; the cost of lowering river crossing pipe lines where erosion has removed the cover; reinforcing the pipe line near where mining operations have been carried on resulting in sinkage which endangers the pipe line; reinforcing pipe lines through congested areas which have developed since the pipe line was laid.

Q. What, in your judgment, is an annual amount which should be provided to take care of extraordinary and abnormal pipe line maintenance?

A. In my judgment, an allowance of $30,000 per year for extraordinary or abnormal maintenance of pipe lines, should be provided.

Q. Did the Michigan Gas Transmission Corporation have any extraordinary or abnormal maintenance in compression stations, measuring and regulating stations, and on field equipment during the twelve months ending June 30, 1941? A. No, it did not.

Q. Have any large parts been renewed?

A. No. In view of the fact that the property is quite [fol. 1873] new, the renewal of parts in equipment in compressor stations, measuring and regulating stations and in field equipment has not been substantial.

* * * * * * * * * *

Trial Examiner: To what line of inquiry were these last questions addressed? I assume that there is no exhibit yet before us that contains the $30,000 figure just mentioned for extraordinary expenses?

Mr. Porritt: It is an estimate of the maintenance cost that will be used in a pro forma statement.

* * * * * * * * * *

By Mr. Porritt:

Q. Should any provision be made, in your judgment, for the fact that the cost of renewing parts in equipment will increase?

A. Yes. In my judgment, an allowance of $8,000 per year should be provided for this purpose, which is $50,000 per compressor station for a twenty-five year period, a total of $150,000 for three stations or $6,000 per year to which has been added $2,000 per year to cover renewals in measuring and regulating stations and field equipment.

* * * * * * * * * *

[fol. 1879] Mr. Lee: What justification is there, in your opinion, for the expenditure of $30,000 a year upon the line from Zionsville to Detroit when there has never been any necessity for such expenditure since the line was built?

The Witness: Well, it is a judgment figure, Mr. Lee.

I think the fact that there have been no breaks in that pipe line does not mean that there will be none. We have

recent cases to cite, the break in the Colorado interstate line and the break in the Chicago pipe line.

[fol. 1880] Mr. Lee: But is this true, that in the operation of the Michigan Gas Transmission Corporation since its organization, there has been no amount budgeted of this kind in anticipation of such a condition as you have set forth?

The Witness: No, we have, of course, covered these things by maintenance as we went along.

Mr. Lee: And you have had no maintenance of this kind from Zionsville to Detroit?

The Witness: No, no extraordinary maintenance.

Mr. Lee: That is right, and this possibility of a maintenance has just developed since this rate case started, hasn't it?

The Witness: No, I would say not. That is something—

Mr. Lee: (Interposing) If it is good judgment, sound judgment, to have it now, why haven't you had it set up for the last five or six years, if it is so necessary?

The Witness: We have had it in our account each year for the last five years. That is, it has been included in maintenance.

Mr. Lee: But there has been no extraordinary appropriation of this kind, we will agree on that?

The Witness: No, that is right.

Trial Examiner: What do you mean you have had it in your account for the last five years?

The Witness: Any expenses of this kind have been [fol. 1881] included in our maintenance expenditures as shown on our financial statement.

Trial Examiner: You did not then have in mind a budget provision?

The Witness: No, sir.

* * * * * * * * *

[fol. 1883] Mr. Littman: I would like to ask Mr. Young some questions.

Mr. Young, do I correctly understand your testimony to be that you are claiming $30,000 per year for so-called extraordinary maintenance in the future?

The Witness: That is correct.

Mr. Littman: That is, of course, in addition to the annual expenditures that have heretofore been required for maintenance?

The Witness: That is in addition to the amount which will be included in the pro forma statement which will be presented for the twelve months period ending June 30, 1941.

Mr. Littman: Yes. It is an additional maintenance item, isn't it?

[fol. 1884] The Witness: That is right.

Mr. Littman: In addition to the usual maintenance?

The Witness: That is right, in addition to what we have termed "ordinary maintenance."

Mr. Littman: And you are also claiming the sum of $8,000 per year by way of increased labor cost in making renewals.

Is that a correct statement?

The Witness: That is not $8,000 for the labor cost but $8,000 for the cost of material and labor.

Mr. Littman: And when you use the term "renewals" I take it you mean replacement?

The Witness: Yes, I am talking of replacement, such as a piston in an engine.

Mr. Littman: And that $8,000 per year is being claimed by you as an item of expense?

The Witness: That is correct.

Mr. Littman: In arriving at these amounts, did you follow the Federal Power Commission's Uniform System of Accounts?

The Witness: No, I did not give any consideration to that in arriving at these amounts.

I just set up $30,000 for pipe lines and $8,000 to cover the other items mentioned there.

Mr. Littman: And, so far as you know, those items might not all be allowed under the Uniform System of [fol. 1885] Accounts of the Federal Power Commission as items of expense but might be items of capital or classified elsewhere, is that correct?

The Witness: I cannot make a positive statement as to that at the present time.

I think that they would all be maintenance items, though.

Mr. Littman: But you do not know, because you said you did not follow the system of accounts.

The Witness: Yes, and I say that I do not think the system of accounts describes what should go in as maintenance and fixed capital, so far as replacement of an engine is concerned.

That is, replacement of a part in an engine.

Mr. Littman: Well, do you have working papers which show the detailed items that enter into this additional $30,000?

The Witness: I do not.

Mr. Littman: Can you supply it for our information and examination?

The Witness: It is a judgment figure.

Mr. Littman: How can we check to know whether part of it is or is not properly included under our system of accounts in maintenance or capital?

The Witness: I could probably furnish you a list of items which I think would probably be replaced in engines over a period of twenty-five years, in my judgment.

Mr. Littman: Where did you get this figure from? Did you build it up from detail, or what did you do?

[fol. 1886] The Witness: It is a judgment figure arrived at by discussion, and I might add that I had the benefit

of the experience of another pipe line company to base my judgment on.

Mr. Littman: What pipe line company?

The Witness: I would prefer not to mention the name of it. The figures were furnished to me in confidence.

Mr. Baldridge: It is not one of our companies, Mr. Littman. It is an entirely outside company and we would a little bit prefer not to mention the name unless it is important.

Mr. Littman: Mr. Young, does Michigan Gas Transmission Corporation now have some cathodic protection equipment?

The Witness: We are putting in some cathodic protection equipment at the present time. There was none included, however, as of June 30, 1941.

Mr. Littman: How is that charged on the books of Michigan Gas Transmission Corporation?

The Witness: It will be charged as maintenance.

Mr. Montgomery: Pardon me, Mr. Littman, what kind of equipment was that?

Mr. Littman: Cathodic protection.

Would you capitalize river crossings?

The Witness: Not repairs to river crossings.

Mr. Littman: Suppose an entire river crossing washed out. How would you charge it?

The Witness: I presume that would go to capital.

[fol. 1887] Mr. Littman: Would be charged to capital?

The Witness: I presume so.

Mr. Littman: Would a river crossing repair be extraordinary maintenance?

The Witness: Yes, I would say so. They do not occur every year. We have had no repairs to make thus far to river crossings.

However, I mentioned one possible source of expense in connection with that in my testimony.

Mr. Littman: Is extraordinary maintenance, then, something that does not occur every year?

The Witness: Well, in speaking of the river crossing, it may not occur every year, but some items of extraordinary maintenance are liable to occur every year.

Mr. Littman: The increased cost in the making of renewals would be charged, would it not, as a capital item?

The Witness: No, I do not believe so, Mr. Littman.

Mr. Littman: You are not an accountant, I take it?

The Witness: I am not an accountant.

Mr. Littman: You are not altogether sure about the answer to that question?

The Witness: I am not too sure, although it has been discussed.

Mr. Littman: If your Honor please, I wish to move to strike all of the testimony of Mr. Young on this with [fol. 1888] respect to the item of $30,000 for so-called extraordinary maintenance and $8,000 for so-called increased cost in making renewals.

The testimony is so vague, indefinite, and nebulous that we, of course, would have no way whatever of checking its accuracy. We do not know, and neither does this witness, what part of these amounts is chargeable under our system of accounts as maintenance of capital or otherwise.

I think the record is eloquent on the subject that this testimony has absolutely no foundation, in fact. It comes from sources which this witness is unwilling to disclose to us.

I think it would be highly unfair to expect the Commission counsel or its staff to be required to check evidence of this kind, so-called evidence.

As a matter of fact, I do not think it is evidence at all, and it has absolutely no evidentiary value. I do not know to what possible use the Commission could put this testimony, not knowing anything at all about its detail or where the items are to be charged and I, therefore, move that this testimony be stricken.

Mr. Lee: On behalf of the Petitioner, your Honor, I desire to join in the objection made by Mr. Littman on behalf of the Commission.

Trial Examiner: The motion is denied.

* * * * * * * * *

[fol. 1894] Mr. Baldridge: Isn't it true, in the case of new property, that very little extraordinary maintenance is necessary over the first few years?

The Witness: That is correct.

Mr. Baldridge: And as the property gets older, you need a greatly increasing amount of extraordinary maintenance?

The Witness: Yes, I would say that is correct.

Mr. Baldridge: And isn't that borne out by the inves-
[fol. 1895] tigations you have made into the business and experience of other companies?

The Witness: That is correct, in the business and experience of the other companies whose record on this subject is available to us.

Mr. Baldridge: So that you think you are justified in assuming that, as the property passes beyond the first few years of its existence, the amount of extraordinary maintenance needed will increase considerably?

The Witness: Yes, I do.

Mr. Lee: But these other companies with whom you wish to make comparison had pipe lines of antique construction compared with this modern pipe line, didn't they?

The Witness: No, the pipe line to which we have referred was built in 1929 and the first item of extraordinary maintenance which was recorded was in 1933.

Mr. Lee: But what I am getting at is this pipe line, at least the portion of it from Zionsville to Detroit, was the most modern type of pipe line construction, wasn't it?

The Witness: It was.

Mr. Lee: And it is not comparable with any other type of pipe line unless it is also the most modern, is it?

The Witness: Yes, I would say that.

Mr. Lee: Is there any other pipe line in the country comparable to this pipe line, as far as modern method of [fol. 1896] construction and materials are concerned?

The Witness: Yes, I would say that there is.

Mr. Lee: Built subsequent to this or previous to this?

The Witness: Built previously and subsequently to this.

Mr. Lee: And did you study their records as to extraordinary maintenance?

The Witness: Their records were not available to me.

Mr. Lee: Then the only record that you made comparison with was the record of the pipe line owned by a company which was not comparable to this pipe line.

The records of the companies that owned pipe lines comparable to this one you had no access to?

The Witness: I did not say that the pipe line that I had reference to was not comparable. I think perhaps it is. It is a line, as I stated, that was built in 1929.

. . . . . .

[fol. 1898] Mr. Littman: I would like to inquire further, Mr. Young, so that I may understand your method.

Mr. Young: if one pipe length of pipe on the Michigan Gas Transmission Corporation's system is removed and replaced by reason of damage, how is the expense of replacing that length of pipe charged?

The Witness: I will have to refresh my memory on the length of pipe that is put through capital. I cannot answer your question.

Mr. Littman: Can somebody tell us the average length of pipe line on the system?

The Witness: You mean the average pipe length in our system?

Mr. Littman: Yes, 40 feet, isn't it?

The Witness: Forty feet, and some 20 feet.

Mr. Littman: Let's start out with the 20-foot length, now. How would you treat that 20-foot length?

The Witness: I would have to refresh myself as to whether that is put through capital. I think it is, but I would have to check that.

[fol. 1899] Mr. Littman: How did you treat that for purposes of making this estimate which you have submitted of $38,000?

The Witness: There would not necessarily be any renewal of pipe in the case of a break.

Mr. Littman: You said there was $8,000 a year for renewals of pipe.

The Witness: No, I said renewals of parts in compressor stations, measuring and regulating stations, and in field equipment, working equipment.

Mr. Littman: How about the $30,000 for extraordinary maintenance? That includes pipe, doesn't it?

The Witness: That includes breakage in pipe, as I mentioned here, repair of pipe line and river crossing breaks.

Mr. Littman: Well, how do you treat a 20-foot break?

The Witness: Well, I do not consider that we would have to replace any pipe necessarily in repairing a break. If the pipe should pull out a coupling, that same piece of pipe could be used in the repair. That is, the same pipe would again be joined.

Mr. Littman: How would you repair it?

The Witness: Well, in the case where it pulled out of a coupling—

Mr. Littman: (Interposing) You do not then anticipate any pipe breakages?

The Witness: There may be material failures of pipe, yes.

Mr. Littman: Well, with $30,000 a year for breaks alone, [fol. 1900] you would have to have a good many leaks to

take up all of that with leak clamps, wouldn't you? That would buy a lot of leak clamps, wouldn't it?

The Witness: Yes, it would buy a lot of leak clamps but I am mentioning a lot of items to make up that amount, repair of slips, repair of river crossing breaks.

Mr. Littman: How much of it is breaks in pipes and river crossings, and how much of it is not?

The Witness: I cannot state that.

Mr. Littman: You cannot state that?

The Witness: I do not know.

Mr. Littman: Well, suppose we have a 40-foot pipe length that goes out by reason of an extraordinary damage. How would the cost of replacing that pipe be handled?

The Witness: May I check that up and answer at a later date? I am not in a position to do that just now.

Mr. Littman: You do not know that now?

The Witness: I do not at this moment.

Mr. Littman: You did not know that when you made up this estimate?

The Witness: That was discussed at the time we made up this estimate. I do not remember it.

. . . . . .

[fol. 1901] Mr. Littman: Did you inquire into the accounting practice of those other companies or another company, with respect to what is charged to maintenance and what is not charged to maintenance?

The Witness: No, but they had listed items of abnormal maintenance, and I assumed that those items listed on the sheet which I had access to were not put through capital.

Mr. Littman: You made no investigation to ascertain whether that company to which you just referred, was fol-[fol. 1902] lowing the Federal Power Commission's system of accounts, did you?

The Witness: No, I did not.

Mr. Littman: Now, Mr. Young, I am going to read from Page 23 of the Federal Power Commission's Uniform System of Accounts prescribed for natural gas companies subject to the provisions of the Natural Gas Act, Account No. 141—Extraordinary Property Losses under the title of Deferred Debits.

. . . . . .

[fol. 1903] I want to read this particular account and then I am going to ask him a question about it. I read from this account:

"A. This account shall include, when so authorized or directed by the Commission, losses in service value of property abandoned or otherwise retired from service which are not provided for by the depreciation or other reserves and which could not reasonably have been foreseen and provided for. It shall include also, when so authorized or directed by the Commission, extraordinary losses, such as unforeseen damages to property which could not reasonably have been anticipated and which are not covered by reserves or by insurance."

. . . . . .

[fol. 1910] Mr. Baldridge: May I ask a preliminary question, Your Honor, which may serve to shorten it a little bit?

Mr. Young, are you now in a position to state what natural gas company you are referring to in making up your judgment figure?

The Witness: Yes, the Memphis Natural Gas Company.

Q. That company is in no way associated or affiliated with Michigan Gas Transmission Corporation?

A. Not to my knowledge.

Q. And the information was received how?

A. The information was received by me through Mr. O. H. Simonds of the Central Service Corporation, which corporation has been retained in this case.

. . . . . .

[fol. 1911] ROBERT S. DREW was called as a witness on behalf of Michigan Gas Transmission Corporation and being first duly sworn, was examined and testified as follows:

By Mr. Porritt:

Q. Mr. Drew, will you state your name and address?

A. Robert S. Drew, 231 South LaSalle Street, Chicago, Illinois.

Q. What is your present position, Mr. Drew?

A. Vice president of Continental Illinois National Bank & Trust Company of Chicago, in charge of the investment [fol. 1912] division of the trust department, responsible for development of general investment policies for supervising the buying and selling of securities, the analysis of securities, examination of trust account portfolios and for consultation on investment with customers of the trust department.

* * * * * * * *

I graduated from the University of Wisconsin with a degree of Bachelor of Science and Civil Engineering in 1913.

From 1913 to 1917 I was assistant engineer with the firm of Sloan, Huddle, Feustel & Freeman of Madison, Wisconsin.

In 1918 I was at the Field Artillery Officer School at Camp Taylor, Kentucky, and remained there as an instructor.

From 1919 to 1920 I was in the bond department of the Illinois Trust & Savings Bank in Chicago as a salesman.

From 1921 to 1926 I was supervising engineer with the Business Research Corporation of Chicago, industrial engineers.

From 1927 to 1941 I have been with the Continental Illinois National Bank & Trust Company of Chicago in the buying division of the bond department for four years and in 1931 I was assigned to the investment division of the trust department.

* * * * * * * *

[fol. 1913] On or about October 21 of this year Mr. Daniel C. Green asked the Chairman of our bank, the Continental Illinois National Bank & Trust Company, if there was a man in his organization qualified to give an opinion as to the question: "What rate of return should a company like the Michigan Gas Transmission Corporation earn on its invested capital or fair value in order to be able to finance by public offering of securities?"

The Chairman mentioned my name to Mr. Green and later asked me to give my assistance to him as a customer of our institution. No mention of fee or compensation was made and none will be charged.

Q. What contact have you had with gas companies' securities?

A. As a general policy we have not purchased natural gas pipeline securities for trust accounts. Our opinion is that natural gas pipeline securities have inherently a substantial risk factor which precludes their use for conservative trust investment.

We have bought and own in trusts a moderate amount of gas distributing company securities. Also there have been deposited in our hands as trustee, from time to time, [fol. 1914] relatively small amounts of natural gas securities which we have had to analyze and follow from an investment and market standpoint.

Q. As a result of your consideration of the problems, did you reach some conclusions?

A. In my opinion, the rate of return which a company like the Michigan Gas Transmission Corporation should earn on its invested capital or fair value, in order to be able to finance itself at this time by public offering of securities, is at least 8.5 percent.

Q. What information did you consider and examine in reaching the conclusions that you reached?

A. Among the information that I had access to were the following: "Investors' Appraisal of the Risks of Capital in the Natural Gas Industry as Compared with Other Divisions of the Utility Industry" Volumes I and II, prepared and filed by Paul B. Coffman, vice president of Standard and Poor's Corporation in this case. Then a typewritten statement taken, I believe, from the books

of the Michigan Gas Transmission Corporation, showing, among other things, gas deliveries, fixed assets, reserve for depreciation, operating revenues and expenses, gross income from operations for the calendar years 1932 to 1940, inclusive, and for the 12 months ended June 30, 1941.

In addition to the material mentioned above, I was given [fol. 1915] orally a broad outline of the case and a general description of the company and its business.

After examining the material furnished to me, I made use of information contained in Moody's Manuals, in Standard and Poor's published pamphlets, "Industrial Surveys" and "Security Markets," and other sources.

I found that the business and property of the following four companies most nearly approach those of the Michigan Gas Transmission Corporation: El Paso Natural Gas Company, Southern National Gas Company, Memphis Natural Gas Company and Interstate Natural Gas Company. These are four of the five companies which Mr. Coffman used in his study.

I made independent calculations for each of these companies to arrive at an average rate of return on their invested capital, including both stocks and bonds. In these calculations I used market values of their securities wherever they were available to me and estimated values where market prices were not available and income as reported for 1940. The results of this study were as follows:

El Paso, 8.9 percent on market value of invested capital; Southern, 10.2 percent; Memphis, 10.4 percent; and Interstate 9.4 percent. The arithmetical average of those four is 9.7 percent.

Inasmuch as only a portion of the securities of these four companies is publicly held and as the market on the [fol. 1916] latter is not a very active one, I wished to check the 9.7 per cent average mentioned above with the returns on securities which are more active in the market. The Dow-Jones industrial stock average is probably more closely followed by investors than any other index of market trends. This is an average of 30 active industrial stocks of representative companies in diversified industries. To these 30 companies I applied the same kind of calculation

as used for the four pipeline companies, using 1941 net income as estimated by Standard and Poor's, and market prices as of November 12, 1941, wherever they were available. Indicating the importance of these 30 companies, the aggregate market value of their securities was about $17,244,000,000 and net income was about $1,494,000,000. The average of the ratios of net income to market value of capitalization was 9.5 per cent. As a group, on a weighted basis, this ratio was 8.66 per cent.

Q. What would you say, in your opinion, would be the most economical method of financing publicly Michigan Gas Transmission Corporation?

A. Under present conditions, I believe the most economical method of financing publicly a company like Michigan Gas Transmission Corporation, assuming a total capitalization of $13,000,000, would be to set up a capitalization of one-half serial bonds and one-half common [fol. 1917] stock. My opinion is that the following setup would be favorably received by the investing public: $6,500,000 of 3.5 per cent serial bonds, one to sixteen-year maturities, and six and a half million dollars of common stock.

Now, as to the bonds, the interest the first year would be $227,500 which, I believe, would have to be covered at least five times after taxes. This would require net earnings after depreciation and taxes of $1,137,500. Interest and serial maturities combined would be covered 1.8 times. I believe these bonds could be sold to net the company about par.

With respect to the common stock after $227,500 of interest and $406,250 annual serial maturity, a total of $633,750, there would remain $503,750 earnings for the common stock. The price earnings ratio for the first year would be about 13. The rate of earnings on the common would be about 14 percent after interest, but before serial maturities and about 7.7 percent after the serial maturities of the bonds.

The $1,137,500 net earnings required for this setup would be about 8¾ per cent on the $13,000,000 capital.

[fol. 1918] Mr. Littman: To what extent did you rely on Mr. Coffman's exhibits in arriving at your conclusions as to rate of return?

Trial Examiner: Supplementing this question, I was going to ask Mr. Baldridge if the exhibits referred to by the witness were 63, 64 and 65 for identification presented in this hearing about October 8 or 9.

. . . . . .

[fol. 1919] The Witness: I am not familiar with the exhibit numbers. These are the two volumes that were furnished me.

Mr. Littman: Will you please read the titles of the two that you—

The Witness: I have already done so in my testimony, but I will read them again, "Investors' Appraisal of the Risks of Capital in the Natural Gas Industry as Compared with Other Divisions of the Utility Industry," Volumes I and II.

Mr. Littman: That is Exhibit 63 and Exhibit 64?

The Witness: Volume I is summary of analyses and Volume II is statistics supporting data in Volume I, Appendixes A, B and C.

Mr. Littman: You didn't examine Exhibit 65, a third exhibit, having numerous charts prepared by Mr. Coffman, did you?

The Witness: No, these are the only two exhibits that [fol. 1920] I have seen of Mr. Coffman's work.

. . . . . .

[fol. 1922] The Witness: Shall I answer Mr. Littman's question now?

You asked me a question which I haven't yet answered.

. . . . . .

Mr. Littman: I think it is simply this, whether you place any reliance on Mr. Coffman's third exhibit which is Exhibit 65 and I believe you stated that you hadn't ever seen that exhibit. Is that correct?

The Witness: That is correct.

. . . . . .

[fol. 1933] FRANCIS S. HABERLY, a witness having been previously sworn, resumed the stand and testified further as follows:

By Mr. Porritt:

. . . . . .

[fol. 1934] Q. Mr. Haberly, were you asked by Mr. Green to prepare an exhibit showing variations of the purchase power of the dollar as related to the Michigan Gas Transmission Corporation? A. I was.

Q. And did you prepare such an exhibit? A. I did.

Q. Mr. Haberly, in your statement of your qualifications and experience you referred to the fact that you had made many appraisals by the use of indexes and that your office currently prepared indexes relating to the cost of electric light and power construction, the cost of electric railway construction, and the cost of artificial gas construction.

Is that not correct?

A. Yes, that is true. I have made extensive use of indexes in many valuations which I have made both since I have been in business for myself and prior thereto. It is likewise true that indexes of construction cost of utility properties are computed monthly in my office based upon formulae and weightings which were developed by me.

In the course of such work, my office has accumulated a very extensive library of index data, not only relating to price movement of commodities and wages in general, but also with special reference to the materials, the equipment, [fol. 1935] and the labor costs entering into the construction of public utility property.

Data of this latter character are kept currently up to date and some of it extends back beyond the Civil War. In fact, in a trended appraisal which was made about five years ago, indexes were prepared and applied to original costs of property built as early as 1849.

Q. Mr. Haberly, would you be able to state about what percentage of your valuation work has been done by means of indexes?

A. I do not know the percentage of valuation which I have done by means of indexes, but I will say that the aggregate value of utility property which I have appraised, where the index system alone has been used in the determination of such value, amounts to something in excess of one billion one hundred million dollars.

Q. As a result of the work which you have done by means of indexes, and your familiarity with them, do you have a knowledge of what has been the tendency of prices of commodities since 1930?

A. Yes, of necessity, I keep myself generally informed of the movement of general commodity prices. The best-known index of general commodity prices, and I think the most accurately compiled, is that of the United States Bureau of Labor Statistics, which index is known as the All Commodities Index of Wholesale Prices and is com-
[fol. 1936] puted on a base of 100 for the year 1926.

This index includes a very comprehensive cross-section of prices in the field of agriculture, mining and manufacturing and includes farm products, foods, hides, textile products, fuel and lighting, metals and metal products, building materials, chemicals and allied products, house furnishings, and so forth.

The trend of prices of the All Commodities Index since 1930 has been somewhat erratic, inasmuch as the period from 1930 to date covers a period of great depression, a period of recovery, and the beginning of a World War.

The All Commodities Index stood at 86.4 for the year 1930 and declined to a low during the depression of 59.8, which point was reached in February, 1933.

The index then rose slowly to a new high of 88.0 in April, 1937, following which it sagged slightly during 1938 and 1939 due to a moderate slump in business.

Following the outbreak of the war, the index made a 4 point jump which was pretty well maintained throughout

the balance of the year 1939 and through the year 1940. Starting with 1941, the index has been rising quite steadily, the latest monthly figure being 91.8 for September, 1941.

The index of All Commodities, therefore, has risen nearly 14 percent in the first nine months of this year.

It is interesting to note the similarity of the movement [fol. 1937] of prices since the outbreak of the second World War, in 1939, with the movement of prices following the outbreak of the first World War in 1914.

Six months after the outbreak of World War I, the index of All Commodities had risen 1.2 percent as compared with 4.9 percent increase six months after the outbreak of the second World War. At the end of one year after the outbreak of the first World War, the index was 3 per cent above its pre-war level and one year following the outbreak of the second World War it was 3.2 percent above its pre-war level.

Two years after the outbreak of the first World War, the index was 23.9 percent above its pre-war level and two years after the outbreak of the present war it was 20.4 percent above its pre-World War level.

By August, 1916, the index had experienced a rise since the beginning of the war of 26.4 percent and for a like period, namely, September, 1941, which is the last date for which complete figures are available, the index showed a rise of 22.4 percent since the beginning of the present war.

To my mind this demonstrates that prices of wholesale commodities will, in all probability, follow a pattern somewhat similar to the movement of prices during the first World War.

Q. If, as you have just stated, prices during this war may follow a trend similar to that in the first World War, what does that mean will be the movement of prices in the [fol. 1938] next several years?

A. During World War I, wholesale Prices of All Commodities increased nearly one and one-half times in the period from 1914 to 1920 and may, if the present war continues, do somewhat the same thing in the next several years.

Price control legislation and price fixing may have some effect upon the extent of the rise, but, in my opinion, prices will rise despite such controls, although the rise may be much more orderly than in the first World War. I hope so, at least.

Q. Mr. Haberly, did prices act in a somewhat similar manner during the Civil War period, which started in 1861?

A. They did. The Civil War was a war within the boundaries of the United States and the effect upon prices was much more immediate, the average of Wholesale Prices for the year 1862 being [illegible] per cent above the average for 1861 and by 1865 was 1[illegible] percent above the average for 1861.

The same economic laws, in general, are at work in each major war and the shape of the curve of price rise varies only as to degree and time.

Mr. Haberly, following the cessation of hostilities, do prices in general return to the pre-war level?

A. They do. Wholesale Prices dropped from their maximum peak during the Civil War at a fairly uniform rate over a period of thirteen years, reaching the pre-war level seventeen years after the start of the Civil War.

[fol. 1939] Following the first World War, prices dropped quite precipitously from their maximum peak in 1920 and stabilized themselves at a level about 40 per cent above the pre-war level for a period of nearly eight years.

Then they dropped again quite sharply during the depression, which started in the latter part of 1929, and reached the pre-war level in the latter part of 1931, or seventeen years after the start of World War I.

Q. Mr. Haberly, so far you have been talking about the trend of wholesale Prices of Commodities. What has been the movement of wages of labor since 1930?

A. The trend of wages since 1930 has followed somewhat the same path as the trend of all commodities. Considering all wages, other than agricultural wages, there was a drop, due to the depression, of between 20 and 25 per cent from 1930 to a low point in 1933, then, due to the

efforts of the Administration, to stronger and stronger unionization of labor and, finally, due to the tremendous demand for labor as a result of the defense program, wages have risen by leaps and bounds until they are now nearly 20 per cent higher than they were in 1930, and better than 50 per cent higher than they were in 1933.

Q. Mr. Haberly, in the figures you have just quoted, you have been referring, have you not, to wages in general? Is that not correct?

A. That is so. I have been talking about wages in [fol. 1940] general, including common and skilled building labor, manufacturing wages, railway wages, public utility wages and road building wages.

In other words, it is an index which represents the general movement of wages in a variety of fields, excluding, as previously stated, agricultural wages.

Q. Mr. Haberly, did wages show tendencies to increase during the last two major wars in a manner similar somewhat to the increases experienced in All Commodities?

A. Yes, they did. During the Civil War, wages increased approximately 50 per cent and never returned to the pre-war level. In fact, they continued to rise slowly until the outbreak of the first World War.

During the first World War, wages increased until by 1920 they were 125 per cent above the pre-war level and, while some of that gain was temporarily lost during the depression of 1922 and again during the depression in 1932, 1933, and 1934, these losses have been made up and wages are now, I should say, about two and one-half times what they were in 1914.

Q. Mr. Haberly, do you expect that we will experience increases in wages during the present war such as were experienced in the former two wars you have just mentioned?

A. Yes, I think we can look forward to further increases in wages. In fact, we have been experiencing them. Skilled building wages, as reported by the Engineering [fol. 1941] News-Record for twenty cities in the United States, have increased slightly over 5 percent since 1939, while common labor wages have increased slightly over 11 percent.

Manufacturing wages for some twenty-five industries, as reported by the National Industrial Conference Board, have increased nearly 14 per cent since 1939. These percent increases do not reflect several further causes of increase in labor costs, namely, the 40-hour week and the necessity of paying time and a half for overtime and double time for Sundays and holidays.

No matter how well organized work may be, it is occasionally necessary to work overtime. In addition to this, Social Security tax must be paid on all wages, and this adds an additional four percent to the present cost of labor.

The increase in wages during the first two years following the beginning of World War I was 9 percent. This figure is taken from the All Wage Index, as computed by the United States Bureau of Labor Statistics, and, in my opinion, is in general accord with the average rise in wages thus far in this war.

Q. So far, Mr. Haberly, you have related the increases in wages that have occurred up to the present time since the beginning of the second World War.

Do you care to state whether you expect [these] will be further gains in wages provided hostilities continue for several years?

A. It is my belief that labor will continue to demand [fol. 1942] and receive further increases in wages. Labor today is very strongly unionized and it is watching the rising cost of living, the profits of industry, and rising taxes.

As long as these things increase, labor will demand increase in wages. I do not know and, frankly, I do not wish to hazard an opinion, as to what level wages may go, but I am definitely of the opinion that they will go in only one direction, and that is upward.

Unless the wage level is frozen, most material costs will rise, and if most material costs rise, then wages of necessity will rise. It is a vicious circle.

Mr. Haberly, could you state the change in wages since 1930?

A. Skilled building wages, again as reported by the Engineering News-Record, for twenty cities, have increased approximately 10 percent since 1930 and better than 50 percent since the low level reached by them during the depression in 1933.

Common labor wages have increased approximately 36 since 1930 and nearly 80 percent since 1932, this again being the low point reached during the depression. With regard to wages in the 25 manufacturing industries, they have increased nearly 40 percent since 1930 and slightly over 65 percent since the low point of the depression in 1933. The increase in wages in the 25 manufacturing industries this year alone has been about 11 [fol. 1943] percent.

Q. Mr. Haberly, have you read the testimony of Dr. David Friday and seen the exhibit which he presented during the presentation of the Panhandle portion of this case? A. I have.

Q. Do you agree with the conclusions which Dr. Friday reached?

A. As I recall the substance of Dr. Friday's testimony and his exhibit, it dealt very largely with the trend of commodity prices and wages before, during and after major wars and appears to have been very carefully and capably prepared.

While an analysis of past and present trends is based upon actual facts, the conclusions and predictions of future trends must be a matter of judgment. The evidence which I have just given, in so far as it deals with commodity prices and wages in general, covers much the same ground as did Dr. Friday in his exhibit and I am in general accord with him as to the probable future trend of prices and wages.

Q. In what way, Mr. Haberly, does the evidence which you have presented as the trend of wholesale commodity prices and of wages relate to the trend of construction and operating costs for public utility properties?

A. The factors which affect general commodity costs and wages likewise affect the costs of operating or building public utilities in a generally similar manner.

[fol. 1944] A public utility property consists largely of commodities plus the labor of manufacturing, fabricating and installing them. While the United States Bureau of Labor Statistics All Commodities Index contains a large number of commodities which do not affect directly public utilities, it does include two major groups of commodities which constitute an important part of public utility property, namely, a group called "Metals and Metal Products" and a group called "Building Materials."

The first group, Metals and Metal Products, is made up of a variety of items, including iron ore, pig iron, bar iron, cast iron pipe, steel pipe, steel billets, steel rail, steel sheets and wire, some of which items, such as cast iron pipe, steel pipe, rail and steel sheets enter directly into the construction, operation and maintenance of public utility property, while the other items I have just mentioned form the materials from which all the machinery and equipment used by public utilities is made.

The Metals and Metal Products group also includes such non-ferrous metals as aluminum, copper, copper wire, lead, zinc, and nickel, which, in more or less degree, are used by public utilities also.

The rise in price for this group, either from 1930 or since the beginning of the war, has been less marked than for the all commodity group as a whole due to the ceiling that has been placed on the price of certain metals and metal products.

[fol. 1945] The metals entering into utility plant require a high degree of processing into machinery, the cost of which therefore reflects not only the cost of the metal, but the cost of labor, which latter, as I have previously testified, has for 25 industries shown marked increases both since 1930 and since the bottom of the depression in 1932 and 1933.

From this, it follows that the trend of costs of mechanical and electrical equipment used by public utilities has been increasing during the period since 1930. That this is the case I will demonstrate more fully later in my testimony.

The second group of commodities, entering directly into the construction, operation and maintenance of public utilities is the group called Building Materials.

This group is composed of such materials as lumber, brick, cement, sand, gravel, crushed stone, structural steel, paint material, glass, tile, lime, pipe, roofing, and so forth, and since 1930 has increased around 18 percent and since the low point of the depression in 1932, almost 50 percent up to the present time.

The labor of fabricating the building materials just mentioned into buildings and structures of public utilities, as I have previously testified, has shown marked increases both since 1930 and since the low point of the depression in 1932 and 1933. Skilled building wages have increased approximately 10 percent since 1930 and better than 50 per- [fol. 1946] cent since 1933. Common labor wages have increased approximately 36 percent since 1930 and nearly 80 percent since 1932.

Q. Mr. Haberly, how does the trend of building material costs since the beginning of World War II compare with the trend for a similar period in World War I?

A. The index of building materials had risen about 19 percent up through September, 1941, over that prevailing during the last month preceding the present World War. For an exactly similar period of time after the start of the first World War, the increase in the index was nearly 28 percent or, in other words, the upward trend of building materials, so far in this war, has been only about two-thirds as great as it was in the first World War for a like period of time.

Q. Have you any figures indicating the price movements of specific items or groups of items entering into the construction of the property of the Michigan Gas Transmission Corporation?

A. Yes, I have. I can give you the trend of costs as relating to a number of items, for example:

The first two 1300 h.p. main compressor units, purchased by the Michigan Gas Transmission Corporation in April, 1936, cost $48,175 each; f.o.b. factory, with freight allowed, and the last one purchased was ordered in August, 1941,

at a cost of $61,983 f.o.b. factory, which, with freight of $1620, gives a cost of $63,603.

[fol. 1947] In other words, there has been an increase in price of Worthington compressors of this size since 1936 of 32 percent.

Compressors of the same size, purchased in 1937, cost about 2 percent more than those purchased in 1936, and those purchased in 1940 cost about 16 percent more than those purchased in 1936.

Expressed in other words, this means that the amount of money spent in 1936 for a main compressor would purchase only 98 percent of a compressor in 1937, and only 86 percent of a compressor in 1940, and likewise only 75 percent of a compressor as of June 30, 1941.

Q. Do you mean by this, Mr. Haberly, that the purchasing power of the dollar has been declining since 1936?

A. That is correct. As I have just stated, the dollar spent for compressor units in 1937 would purchase only about 98 percent of what it would in 1936; in 1940, only about 86 percent of what it would in 1936; and as of June 30, 1941, only about 75 percent of what it would in 1936.

The same decline in the purchasing power of the dollar has taken place in varying degree with respect to practically all other items of property as well as with respect to the labor necessary for the installation of such property.

To illustrate, the decline in the purchasing power of the dollar since 1936 for 180 kw. Engine-generators, present purchasing power as related to 1936 as 1.00 is now only [fol. 1948] .773; for Worthington pumps, it is now .774; for elevated water tanks erected is .692; for traveling cranes is .555; for steel pipe in large sizes is .900; for valves, .749; for main compressor buildings, erected, .736; for the labor of installing equipment, .568; for the labor of erecting structures, .550; and for the labor and expense of installing mains, .736.

Q. Mr. Haberly, have you prepared an exhibit entitled, "Michigan Gas Transmission Corporation, Variation in Purchasing Power of Dollar as Related to 'Gas Plant', 1936 equalling 100"? A. I have.

. . . . . .

(The Document Referred To Was Marked Exhibit No. 97 For Identification.)

* * * * * * * * *

The Exhibit contains six charts which present graphically the variation in the purchasing power of the dollar as related to Station Structure Material; Station Structure Labor; Main Compressor Units; Station Equipment Labor; Steel Pipe, Large Sizes; and Mains Installation Labor.

These six groups constitute the most important elements making up the property of the Michigan Gas Transmission Corporation.

[fol. 1949] Following the charts, there is a folded sheet setting forth in tabular form the variation in the purchasing power of the dollar with respect to eleven important items of property, including those covered by the six charts.

The last column on this tabulation, which is headed "Composite of Total 'Gas Plant'," represents the variation in the purchasing power of the dollar as spent for all of the property constructed each year.

The figure of .862, as shown in the lower right-hand corner of the tabulation opposite the caption "Purchasing Power at June 30, 1941, of Actual Dollars spent on 'Gas Plant'," expresses the percent of property that could have been built at the time the various units of property were built by using today's dollar with its present purchasing power.

In other words, the same number of dollars as were originally spent for this property, if spent as of June 30, 1941, would build only 86.2 percent of the present plant.

* * * * * * * * *

[fol. 1952] Fred A. Spitznagle a witness, having been previously sworn, resumed the stand and testified further as follows:

* * * * * * * * *

By Mr. Porritt:

* * * * * * * * *

[fol. 1954] Q. Mr. Spitznagle, I hand you exhibit labeled "Statement of Income and Expense, per books," consisting of three pages, and ask, Mr. Examiner, that this be marked No. 99 for the purpose of identification.

(The Document Referred To Was Marked Exhibit No. 99 For Identification.)

* * * * * * *

A. Exhibit 99, page 1, is a condensed statement of income and expenses, per books, of Michigan Gas and its predecessor company, Indiana Gas Transmission Corporation, for the calendar year 1936 and of Michigan Gas for [fol. 1955] the calendar years 1936 to 1940, inclusive, and the twelve months ended June 30, 1941, as well as the six months periods ended December 31, 1940, and June 30, 1941.

Page 2 of this exhibit lists for the calendar years 1938 to 1940, inclusive, the twelve months ended June 30, 1941, and each six months period included in the latter period, the amount of charges paid by Michigan Gas to associated companies for management supervisory and other special services, and the operating and gas plant accounts to which such charges were recorded.

Page 3 of this exhibit sets out, with respect to the depreciation provision charged to income for the periods reported on in the condensed statement of income and expense, except the six months ended December 31, 1940, the depreciable base of gas plant, annual depreciation rate used, annual charge classified as depreciation, and facts as to depreciation on transportation and special equipment charged to transportation expense clearing accounts.

* * * * * * * *

Trial Examiner: The statement of income and expense identified as Exhibit No. 99 will be received without ob- [fol. 1956] jection, in evidence.

(Exhibit No. 99 For Identification Was Received in Evidence.)

Q. Mr. Spitznagle, I hand you an exhibit titled, "Statement of Income and Expense, per books, and After Adjustments and Redistributions," and so forth, consisting of

four pages and, Mr. Examiner, I ask that this exhibit be marked No. 100 for the purposes of identification.

(The Document Referred To Was Marked Exhibit No. 100 For Identification.)

. . . . . .

Exhibit 100, page 1, reflects, in part, with respect to the six months period ended December 31, 1940, and the six months period ended June 30, 1941, the same statement of income and expense as is shown on page 1 of Exhibit 99, just offered in evidence.

It also shows the amount of adjustments and redistributions required to be made to reflect the annual result per books of the operation of said six months periods on an annual basis, and it shows the result of operations so adjusted for the twelve months ended June 30, 1941.

It will be noted in this exhibit that the net gas operating [fol. 1957] revenues per books is $859,295.46 which is obtained by adding the amount shown on Page 1 for the six months ended December 31, 1940, of $316,903.74 in Column A to the amount $542,391.78 shown in Column D on the same line, which is Line 11 whereas, after the adjustments and redistributions, it is $969,993.36 which is the amount shown on Line 11 under Column G.

Pages 2 to 4, inclusive, detail the adjustments recorded and keyed, as such, on Page 1 of this exhibit, and I believe the adjustments as described, are self-explanatory.

. . . . . .

[fol. 1958] By Mr. Porritt:

Q. Mr. Spitznagle, I have an exhibit titled "Comparative Statement of Operating Revenue" and, Mr. Examiner, ask that this exhibit be marked No. 101 for the purpose of identification.

. . . . . .

(The Document Referred To Was Marked Exhibit No. 101 for Identification.)

. . . . . .

Exhibit 101 lists the name of each customer of Michigan Gas and each customer of Panhandle Eastern to whom gas

deliveries are made by Michigan Gas Transmission Corporation and the operating revenue derived by Michigan Gas Transmission Corporation from such customers in the calendar years 1936 to 1940, inclusive; for the twelve months ended June 30, 1941, and in each six months of the latter period.

The information shown supports the classified and total operating revenues shown in the condensed statement of income and expense, submitted as Exhibits 99 and 100.

. . . . . .

[fol. 1959] (Exhibit No. 101 Was Received in Evidence.)

Q. Mr. Spitznagle, I have an exhibit titled "Operation and Maintenance Expenses" and, Mr. Examiner, ask that this exhibit be marked No. 102 for the purposes of identification.

. . . . . .

(The Document Referred To Was Marked Exhibit No. 102 for Identification.)

. . . . . .

A. Exhibit 102 contains the detailed operating and maintenance expenses for Michigan Gas Transmission Corporation for the six months ended December 31, 1940, six months ended June 30, 1941, and twelve months ended June 30, 1941, classified in accordance with the classification of accounts promulgated and prescribed by the Federal Power Commission.

. . . . . .

[fol. 1960] (Exhibit No. 102 Was Received in Evidence.)

By Mr. Porritt:

Q. Mr. Spitznagle, I have an exhibit titled "Gas Sales, Gas Transported, Gas Used by Company, Line Losses and Gas Purchased", and ask, Mr. Examiner, that this exhibit be marked 103 for the purposes of identification.

. . . . . .

(The Document Referred To Was Marked Exhibit No. 103 for Identification.)

. . . . . .

A. Exhibit 103 details with respect to Michigan Gas Transmission customers and those of Panhandle Eastern to whom gas is delivered by Michigan Gas the volume of gas, expressed in thousand cubic feet, delivered to such customers during the calendar years 1936 to 1940, the twelve months period ended June 30, 1941, and each six months period in the latter period.

It also shows the volume of gas used by the company, line [fol. 1961] losses of the company, and the total volume of of gas purchased during the same periods. In other words, the information shown is the volume of gas responsive to operating revenues in the periods outlined.

* * * * * * * * *

Mr. Littman: Are these figures as per books and records of the company?

The Witness: Books and records, yes, taken off of the books and records of the company, that is correct. I so testified at the beginning of my testimony.

* * * * * * * * * *

[fol. 1962] (Exhibit No. 103 Was Received in Evidence.)

* * * * * * * * *

[fol. 1964] By Mr. Porritt:

Q. Mr. Spitznagle, I have an exhibit titled "Estimates [fol. 1965] —Original Cost Rate Base—Pro Forma Utility Income before Allowance of Amortization of Investment—Annual Amortization Allowable—Pro Forma Utility Income Allowable and Deficiency in Pro Forma Utility Income over Amount Allowable", and, Mr. Examiner, I ask that this exhibit be marked No. 104 for the purposes of identification.

(The Document Referred to was Marked Exhibit No. 104 for Identification.)

* * * * * * * * *

A. This exhibit has been prepared to show the amount of utility income available for amortization responsive to and return on the original cost rate base, of Michigan Gas Transmission Corporation, based on the Company's operations for said twelve months period adjusted as here-

after explained by me, the annual amortization responsive to the original cost rate base, the return allowable on the original cost rate base and the original cost rate base.

The adjustments made in this statement are for the purpose of giving effect to changes in conditions in or since the twelve months period reflected per books as adjusted, and affecting the company's income for the twelve months period ended June 30, 1941, and to provide for proper amortization of the investment.

The adjustments referred to are explained as follows:

[fol. 1966] It will be noted that the first item on this statement originates on Exhibit 100 previously submitted in this case. The item of depreciation preceded by the numeral 1, in parentheses, on page one of this exhibit is added back to utility income because of the amount for amortization of the investment substituted at the bottom of this page under the caption "Annual Amortization", and so forth.

The next item of Federal income and excess profits tax is added back to income in lieu of the deduction substituted under item 11, in order that proper adjustment be made to cover the effect of United States Revenue Act of 1941 with respect to the Company's taxable income for the six months ended December 31, 1940, and some of the other adjustments made in this statement. Taxes for the calendar year 1940 are payable by the company under the Revenue Act of 1940.

The next item, prefixed by the numeral 3, is added back to the amount of utility income to exclude the amount of this item from expenses. It represents small expenditures for donations made by the company which under the Federal Power Commission classification of accounts must be included in an account designated "miscellaneous income deductions."

The next item, prefixed by the numeral 4, has been added to the amount of utility income in order to reflect in such income the amount of annual revenue the Company will be entitled to receive for gas transported under its contract [fol. 1967] with Kentucky Natural Gas Corporation.

The next item, prefixed by the numeral 5, has been added to utility income because of the inclusion of the amount of this item in working capital, Exhibit 94, offered for identification in this case.

The next item, prefixed by the numeral 6, has been deducted from the amount of utility income, based on the amount of the estimated effect on utility income of completing construction work in progress, as at June 30, 1941, as detailed in Exhibit 95 submitted for identification in this case.

The next item, prefixed by the numeral 7, has been deducted from utility income to provide for amortizing the expense of the instant case, as detailed in Exhibit 96.

Before explaining the next item, I wish to point out that the title of this item is not to be construed as a claim for the allowance of such item as maintenance. Actual expenditures incurred in the future with respect to this item will constitute expenditures for maintenance and renewal and replacements, and the latter item will result in retirements of property, all as prescribed in the Federal Power Commission Classification of Accounts.

This item, prefixed by the numeral 8, is deducted from utility income to provide for future expenditures of this character as explained, which are not included in the annual amortization provision included in this statement.

[fol. 1968] The amount used is as testified by Mr. George Young, in this case.

The next item, designated by the numeral 9, is deducted from utility income to provide for an annual wage increase made by the company on July 1, 1941.

The next item, designated by the numeral 10, has been deducted from utility income to give effect to numerous rate changes made in the period ended June 30, 1941, and contracted to be made.

During the period in question, numerous rate changes became effective, both with respect to charges made to distributing companies and municipalities and the amounts paid to Panhandle Eastern Pipe Line Company for the gas deliveries to those companies and municipalities, the

major change occurring during the period being a substitution of 3 and 4 cents rate for the demand commodity form of rate in most of the gas sales and transportation contracts and the corresponding change in the cost of such gas to Michigan Gas Transmission Corporation.

The new form of rate was offered to all companies and has been accepted by all except the Michigan Consolidated Gas Company and the Kokomo Gas and Fuel Company.

The effective date of the change varied for the different companies depending on their acceptance of the new rate. The following are the effective dates applicable to the various companies:

[fol. 1969] Indiana-Ohio Public Service Company—January 1, 1941;

Lynn Natural Gas Company—May 1, 1941;

Northern Indiana Public Service Company—July 1, 1940;

Public Service Company of Indiana—April 1, 1941;

Town of Lapel, Indiana—June 1, 1941;

Town of Pittsboro, Indiana—May 1, 1941;

Town of Roachdale, Indiana—May 1, 1941;

Indiana Gas Distribution Corporation—June 1, 1941;

The Ohio Fuel Gas Company—June 1, 1941;

Ohio Gas Light and Coke Company—November 1, 1940;

Central States Natural Gas Co., Inc.—November 1, 1940;

Toledo Edison Company—December 1, 1940;

In addition to the foregoing, the new rate has been accepted by the following companies, but the effective date of the change has not as yet been established by the Federal Power Commission:

Central Indiana Gas Company;

Pendleton Natural Gas Company;

Town of Montezuma, Indiana.

In making the recalculation, the revenue and gas purchase cost with respect to deliveries to all of the above-listed companies has been restated to give effect to the rates provided in the new contracts for the entire twelve-months' period ended June 30, 1941.

Effect has also been given in the restatement, to the new [fol. 1970] rates applicable to industrial gas deliveries which have not as yet been made effective by the Federal Power Commission.

In restating revenue derived from sales to Central Indiana Gas Company, consideration was given to the fact that under the provisions of the proposed contract, deliveries to certain customers of that company which, under the old contract, were classified as industrial deliveries, will, under the new contract, fall into the firm gas classification.

Viewing the industrial gas situation as a whole, the net effect of the new industrial rate indicates a reduction in Michigan Gas Transmission Corporation's utility income, before taxes, of industrial gas deliveries of $66,863.90.

Based on deliveries during the twelve-months period analyzed, the analysis indicates that if the rates now in effect and those rates incorporated in contracts which have been executed but have not as yet become effective had all been enforced during the twelve-months period ended June 30, 1941, utility income, before taxes, of the company would have been reduced in the total amount of $93,538.60.

The next item preceded by the numeral 11 is a recomputation of the Federal income tax of Michigan Gas Transmission Corporation with respect to the taxable income shown in this statement.

The balance of the items on this page, as well as those on page 2, will be explained by Mr. Daniel C. Green.

[fol. 1971] Pages 3 to 6, inclusive, describe the adjustments made in this exhibit.

. . . . . .

DANIEL C. GREEN, a witness called on behalf of Michigan Gas Transmission Corporation, being duly sworn, was examined and testified as follows:

[fol. 1972] By Mr. Porritt:

Q. Mr. Green, will you give your full name and address?

A. Daniel C. Green, 327 South LaSalle Street, Chicago, Illinois.

. . . . . .

I am a graduate of Purdue University, 1908, with a degree of Bachelor of Science, Electrical Engineering.

Q. What is your present position?

A. President and Director of Central Service Corporation, a corporation which specializes in rendering consulting, advisory, and special services to public utility companies in all phases of operation.

It is an independent corporation, neither controlled by, nor affiliated with, any other corporation or group.

. . . . . .

I first started in the utility business in San Diego, California, connected as Commercial Manager of San Diego Consolidated Gas & Electric Company, a company rendering electric and manufactured gas service. That was for the period January, 1909, to July, 1910.

I was then connected with the Oregon Power Company, Albany, Oregon, as manager of the company's operations which consisted of electric and water business, from July [fol. 1973] 1, 1910, to December 1, 1911.

I was then connected with the Oregon Power Company, Marshfield, Oregon, electric and manufactured gas, as General Manager, from December 1, 1911, to March 10, 1913.

I was then connected with the Everett Gas Company, Everett, Washington, electric and manufactured gas business, as Vice-President and General Manager, from December 1, 1913, to March 10, 1915.

. . . . . .

I then was connected with the Utah Power & Light Company, Salt Lake City, Utah, electric and gas business,

as Division Manager, from March 10, 1915, to September 15, 1916.

Then I returned to the Byllesby group, so-called, as Vice-President and General Manager of the Fort Smith Light & Traction Company, of Fort Smith, Arkansas, which company rendered electric, natural gas, and street railway service. That was for the period of September 15, 1916, to August 15, 1923.

I then returned to Utah Power & Light Company, Salt Lake City, Utah, as Vice-President and General Manager for the period August 15, 1923, to April 1, 1929.

During the same period, I was also Vice-President of Utah Light & Traction Company and the Western Colorado Power Company, Durango, Colorado.

[fol. 1974] I was then connected with the Electric Bond and Share Company, New York City, New York, a holding company, from April 1, 1929, to July 31, 1933.

On March 5, 1930, I was elected a Vice-President of that company.

I might say that the position of Vice-President and General Manager of the various operating companies that I have referred to, the duties as such were similar to the presidents of corporations today. In those days, the President of the local operating company was usually some man back at the main office of the holding company.

I merely state that to give you a better description, I think, of the duties I performed as Vice-President and General Manager, you might say, of an operating company.

From August 1, 1933, to July 23, 1934, I left the Electric Bond and Share Company and accepted an assignment as Manager for the Receivers of the Middle West Utilities Company, which was in receivership, Edward N. Hurley and Charles A. McCulloch being Receivers. The Middle West Utilities Company at Chicago, Illinois, was transferred to 77B Proceedings, July 23, 1934, and, at that time, I was appointed Trustee of the Middle West Utilities Company by Judge James H. Wilkerson of the District Court of the United States for the Northern Dis-

trict of Illinois and the company was reorganized and securities issued fourteen months later, November 27, 1935.

[fol. 1975-76] On reorganization of the Middle West Utilities Company into what was known as the Middle West Corporation, I was President and Director of that company from November 27, 1935, to October, 1937.

I resigned as President of the Middle West Corporation and as Director in October, 1937, to organize and did organize the company I am now President of, Central Service Corporation.

Q. Have you, in these various positions, had quite a broad experience in the financing of public utilities?

A. Naturally, when I was directly connected with operating companies, that problem was before me and especially later, as Trustee of the Middle West Utilities Company and as President of the Middle West Corporation and as a Vice-President of Electric Bond and Share, with those properties that I was delegated to follow.

* * * * * * * * *

Q. Mr. Green, will you please state for the record the circumstances under which your company, Central Service Corporation, was employed in connection with this case?

A. Mr. Beckjord, president of Michigan Gas Transmission Corporation, called me to New York City and advised that the corporation was a party to the rate proceedings before the Federal Power Commission, and asked that we accept the assignment of advising and assisting in the preparation of the data and evidence to be sub-
[fol. 1977] mitted in this case.

Q. Do you personally, or does your corporation own any securities of Columbia Gas and Electric Corporation or any of its subsidiaries and affiliates, including Michigan Gas Transmission Corporation?

A. I personally do not own any of these securities, nor does Central Service Corporation.

Q. Do you personally, or does Central Service Corporation own any of the securities of the Missouri Kansas Pipe Line Company or Panhandle Eastern Pipe Line Company?

A. No.

Q. From the record which you have submitted of your experience and qualifications, have you ever been connected with any company that is a subsidiary or an affiliate of any of the companies parties to this case?

A. I have never been connected at any time with any of those companies.

Q. Mr. Green, as President of your organization I assume that you personally have followed the work of your organization and the scope of testimony and exhibits which have been presented in this case.

Is that correct?

A. Yes, that is correct.

Q. Are you familiar with and have you studied the earnings statements of Michigan Gas Transmission Cor- [fol. 1978] poration and the various exhibits which have been presented in this case?

. . . . . .

[fol. 1980] In the future, we can reasonably expect great advancement in coal gas manufacturing plants. The coal gas manufacturing process will continue to be improved, and we can expect new commercial products to be recovered from coal to the point where the net cost of manufactured gas from coal will be competitive with natural gas transported the great distances that gas is now transported through the pipe lines of Panhandle Eastern and Michigan Gas.

[fol. 1981] I personally know of hydroelectric plants that were built 15 years ago that will have useful lives of not less than 100 years. The cost of the hydroelectric power at that time was considerably less than for power generated by coal steam plants.

Today, due to the advancement in the art of steam generation by coal, the cost of steam electric power is considerably lower than the hydroelectric power generated by those plants.

I cannot stress too strongly the possible competition that might face natural gas transported through this pipe line 15 or 16 years hence. Such competition might have the effect of greatly reducing, if not eliminating, the large

quantities of gas now transported through this pipe line. Obsolescence occurs; it does not accrue.

. . . . . .

[fol. 1983] Operating expenses as shown in this statement, Exhibit 104, are based on wage levels of the corporation existing as of July 1, 1941. Federal taxes are based on the Revenue Act of 1941, and local taxes, for the most part, on taxes paid for 1940.

The cost of living index is showing an upward trend. We can expect further increases in operating expenses due to increased wages, cost of materials, and other costs.

No allowance is made for these contingencies in the Pro Forma Income Statement, Exhibit No. 104, and, in my opinion, they are more than contingencies.

We have seen the effect of the new tax laws on the earnings of this corporation and others. We are daily reminded by all branches of our Federal government that we can expect further substantial increases in Federal taxes next year and the year following.

The costs of government of all local, special divisions, cities, counties, and states, are gradually increasing. We can expect them further to increase local taxes in the future. Local governments will be alert to devise new forms of taxation, all of which will further tend to increase the total tax items of any corporation.

[fol. 1984] No amount is allowed for this contingency in the Pro Forma Income Statement, Exhibit No. 104.

. . . . . .

The Michigan Gas Transmission Corporation is a wholly owned subsidiary of Columbia Gas and Electric Corporation, which I shall call Columbia Gas.

Its capital structure as of June 30, 1941, was as follows:

6 percent Demand Notes, payable to parent company	$5,900,500
6 percent Loans, payable to parent company	$2,420,000
44,800 shares no par value common stock	$2,240,000

Q. If this corporation were to be financed today as an independent corporation and not as a wholly owned subsidiary, what changes, in your opinion, should be made in its financial structure?

A. In my opinion, a sound financial structure to finance this corporation would consist of $5,600,000 principal amount 16-year serial debentures, with an assumed coupon rate of 3½ percent, and $5,300,000 par value of common stock.

Mr. Gorman: What is that opinion based upon, Mr. Green?

The Witness: It is based on my experience in working [fol. 1985] out recapitalizations and the securities to be issued in financing new enterprises.

Mr. Gorman: As an officer of the corporations which you have testified you were connected with previously?

The Witness: You mean, where did I get the experience?

Mr. Gorman: Yes.

The Witness: Various operating companies that I was the operating head of, during their refinancing; then with the Electric Bond and Share Company, following operations there of subsidiaries and, more particularly, where perhaps my opinion carried more weight, when I was trustee in the 77 (b) of Middle West Utilities which had to do with the refunding of many of the securities of many of their subsidiaries.

* * * * * * *

By Mr. Porritt:

Q. If this corporation were financed on this basis, what effect would such securities have on the Federal taxes deducted in determining the Pro Forma Income in Exhibit No. 104?

A. The Federal normal, excess profits, and surtax taxes paid, and to be paid by Michigan Gas, would be greatly increased.

* * * * * * * *

[fol. 1990] Mr. Littman: May I ask a question, please?

On what theory, Mr. Green, do you think that it is just and proper that excess profit taxes be paid by the gas consumers?

. . . . . .

[fol. 1991] The Witness: If the Federal Power Commission or any other regulatory body determines the policy that any form of taxes,—I do not care whether it is excess profits tax, the Federal normal tax, or any other tax,—is not to be considered an expense of the company in determining rates, you would have to then adjust your rate of return to offset that because, in my opinion, no investor would go buy securities of the company on any such basis.

Mr. Lee: Why couldn't you fix a rate that would not produce an excess profit and require such a tax?

The Witness: That comes to the question about what is a fair return.

. . . . . .

Q. The Pro Forma Income Statement, Exhibit No. 104, [fol. 1992] shows the annual amount for amortization of the investment. Is that correct?

A. Yes, sir.

. . . . . .

[fol. 2002] Q. You are aware of the fact that in these proceedings, counsel for the Commission has objected to the introduction of testimony regarding the reproduction new value of the physical property used in rendering service, and you are also aware of the contention or position taken by the Commission in certain other cases that the so-called rate base should be based on the original cost of the property and other elements entering into the rate base, such as working capital, and so forth.

If original cost is used as a basis of determining a rate base, does such method, in your opinion, interfere with or deprive the owners of any rights as investors?

A. It is my opinion that the use of the reproduction theory or the original cost theory, either one, does not deprive the investor of any rights or benefits, provided you properly define fair rate of return.

Q. Will you please explain more in detail your reasons for making this statement?

A. It is my conception that the rates of a public utility should be just and reasonable. The investor is entitled to a fair return on a fair value of his property used and useful in rendering service to the public.

As an example, if property is built today at a cost of one million dollars, and it is assumed that the fair rate of re- [fol. 2003] turn in today's dollars on property constructed with today's dollars should be 8 percent, the investor would be entitled to $80,000 annual return. If, however, this property was built during a period of lower prices, or when the dollar had a greater purchasing value than it has today, you must use reproduction cost as the rate base, if you are to use the 8 percent return. Or, if you use original cost, you must allow a higher return to compensate for the change in the value of the dollar.

Mr. Gorman: Is that what you construe to be the legal interpretation of the decision of the Court, or is that your opinion?

The Witness: This is purely my opinion.

Mr. Lee: (Interposing). It is a system we would like to see established.

The Witness: I certainly would, as an investor.

To use a homely illustration, if a person invests his money in a public utility and the company constructs property today for the public use, he is entitled to receive a fair return on his investment, and that fair return is equivalent to a certain amount of bacon and eggs. Each year thereafter, he is entitled to receive the same amount of bacon and eggs regardless of the purchasing power of the dollar.

. . . . . .

[fol. 2005] The Witness: My conception is that in a private industrial concern, we will say, where there is no regulation as to limiting your return, you will have swings, you will go way up during some years and earn 20 or 30 percent, and down to 1 or 2 percent, purely a risk.

Now, with a regulated business, the return is not guaranteed. You have a ceiling. That is really a fact, there is a

ceiling there, and the investor is entitled to a fair return on the fair value of his property.

Now, I am saying if you take one side of this equation, which is the rate base over here, and you are going to freeze that in original dollars spent and use that as that factor you must have over on this side that return in relation to the value of those dollars that you are going to pay him. In other words, you cannot pay him lead dollars.

. . . . . .

[fol. 2006] Mr. Littman: One question while you are on this subject, Mr. Green: Do you think the investor should assume any risks of the change in value of the dollar?

The Witness: In a regulated industry, no. He assumes enough risks in the business itself.

Mr. Littman: He should not stand any of those risks at all?

[fol. 2007] The Witness: I do not think so, no. If the dollar varies I think the return should be varied, if you are not going to vary the value over here of the investment.

. . . . . .

[fol. 2012) By Mr. Porritt:

Q. Mr. Green, based on your investigation of the affairs of Michigan Gas, including gross operating revenues and utility income as shown on its financial statement, as well as the Pro Forma Income Statement prepared by your organization under your direction, will you please state your opinion as to the reasonableness of the earnings of this corporation as of June 30, 1941, and the expected earnings in the near future?

A. Based on my study of the affairs of this corporation, the testimony of the witnesses, the exhibits, the adjusted income statement, pro forma income statement, and all factors which I have considered with reference to the present and immediate future earnings, it is my opinion that the Michigan Gas Transmission Corporation is not presently receiving an unreasonable return on its investment.

. . . . . .

[fol. 2016] WALTER C. BECKJORD, was called as a witness on behalf of Michigan Gas Transmission Corporation, being first duly sworn, was examined and testified as follows:

Direct Examination.

By Mr. Porritt:

Q. Will you please state your full name, Mr. Beckjord?

A. Walter C. Beckjord.

Q. Where do you reside?

A. Greenwich, Connecticut.

Q. Will you please state briefly your experience in the gas industry?

A. Well, I was born in St. Paul, Minnesota, in 1888.

[fol. 2017] I attended the public schools there and graduated from the University of Minnesota in 1909 with a degree of electrical engineer.

During the summer I worked in the utility business as a lineman and a ditch digger, and I started in an apprenticeship course with the St. Paul Gas & Light Company in 1906. I was construction engineer and electrical engineer and, also, in charge of gas works operation and pipeline construction.

In 1912 I went to Binghamton, New York, and made an electrolysis survey.

During the period from 1913 to '15 I made electrolysis surveys in Milwaukee, Wisconsin; Long Branch, New Jersey; San Antonio, Texas; and St. Joseph, Missouri.

In the period from 1915 to 1918 I was engaged in appraisal work, starting in in the Madison Gas & Electric Company, which is one of the subsidiaries of the American Light & Traction Company, which company operated extensive properties in Michigan, Detroit, Grand Rapids, Muskegon, later Ann Arbor, also, Binghamton, New York; Long Branch, New Jersey; Milwaukee and Madison, Wisconsin; St. Paul; St. Joseph, Missouri; and San Antonio, Texas.

I operated the Madison Gas & Electric property for a while and then was transferred to New York as assistant engineer of the American Light & Traction Company.

In 1918 I was sent to Kentucky to operate a coal mine [fol. 2018] to supply coal for Detroit. I spent about a year down there and later became president of the White Star Coal Company. That was sold and I was back in operating work for the American Light & Traction Company, engaged in rate work, construction work, gas and electric operation, the construction of electric plants.

I had something to do with natural gas in St. Joseph, Missouri, and San Antonio, Texas.

I became vice president and chief engineer and director of the American Light & Traction Company in about 1926 and was with that company in that position until about 1930.

In 1929 our offices were transferred to Chicago and at the beginning of 1930 I accepted a position as vice president and general manager of the Boston Consolidated Gas Company in Boston, Massachusetts.

I stayed there about five years and then accepted a position as vice president and general manager of the Columbia Gas & Electric Corporation, with headquarters, to begin with, in Pittsburgh.

I was elected Chairman of the Executive Committee in 1936, I believe, and in 1935 I became president of the Michigan Gas Transmission Corporation, which was organized to build the line from Dana to Detroit.

In 1938 I became president of the Columbia Engineering Corporation, still continuing as vice president and general [fol. 2019] manager of the Columbia Gas & Electric Corporation.

I think that brings me down to the present date, which positions I now hold.

I am a director of various subsidiaries of the Columbia Gas & Electric Corporation, including The Cincinnati Gas & Electric Company, The Dayton Power and Light Company, United Fuel Gas Company, Michigan Gas Transmission Corporation Binghamton Gas Works and some of the others.

Q. What connections have you had with the various trade organizations in the natural gas industry?

A. I first became connected with the American Gas Association activities in 1919. I was active on an electrolysis committee then.

In the period from 1926 to 1928, I was chairman of the technical section. In 1932, I think it was, I was chairman of the commercial section and I have been a director of that organization since 1932.

In 1939 I was first vice president of the American Gas Association and became president during the period of 1939 and '40.

Q. Did you negotiate the contract between the Panhandle Eastern Pipe Line Company and the Michigan Consolidated Gas Company?

A. Yes, in 1934 when I came with the Columbia organization I first started in negotiating on some contracts in eastern Pennsylvania which were in the territory sup- [fol. 2020] plied by the Atlantic Seaboard Corporation. That line had been built in the early part of 1931, as I recall it, before my connection with the system and contracts had never been consummated with the group of utilities around Philadelphia and I was at work on that at the same time.

Early in 1935, I started discussions with Mr. William G. Woolfolk, who was president of the Detroit City Gas Company, along the lines of bringing straight natural gas to Detroit from Texas.

I was designated as agent of the Panhandle Eastern Pipe Line Company by Mr. Burt Bay who was then president and I spent considerable time in Detroit in the spring of 1935.

I was, of course, very familiar with the problems at Detroit because I had been with the holding company some 23 years and was very familiar with the operating conditions in Detroit and the general layout of their plant and system, and in my discussions with Mr. Woolfolk I suggested the idea of using the demand and commodity rate, which I thought would be better suited to their conditions in Detroit than a straight flat rate that had been discussed with them in the years previous to that.

I believe there had been some discussions prior to 1935, but I was not familiar with those because I was not an employee of the Columbia Gas & Electric Corporation at that time.

There were, also, some brief discussions with Mayor [fol. 2021] Cousens. Frank Cousens of Detroit, about that time, who was very much interested in bringing natural gas to Detroit, particularly for the large industries located there, the automobile industry.

After considerable discussion we arrived at gate rates of 38 cents per therm per month and a cent and a half per therm for the commodity cost, commodity charge.

One of the principal difficulties we had to overcome was the fact that Texas is about 1200 miles from Detroit and there being only a single pipeline, it was considered a considerable operating hazard to have either straight natural gas or to have a system operating without a standby plant.

We discussed mixed gas operations, because at that time or just previous to this time that I speak of, Detroit had been getting a large share of their gas requirements from the Semet-Solvay who had a large by-product coke plant in Detroit and I think they were buying gas, about 26,000,000 a day, if I remember correctly, or thereabouts, and at sometime during the past they bought by-product coke oven gas from the Ford plant.

I first talked about mixed gas, but that didn't seem to be feasible under the conditions. Ford was then using all his own gas and there was some question of price with Solvay with which negotiations I am not familiar, but the result of [fol. 2022] it all was that we signed a contract during the summer of 1935, I believe it was August 31, 1935, calling for the delivery of approximately 90,000,000 feet of natural gas from Texas to Detroit.

In that contract we stipulated that water gas plants in Detroit which had a capacity of around 60,000,000 to 65,000,000 cubic feet, I believe, be converted to making 1,000 B.t.u. oil gas and we stipulated that those plants should be used for standby plants and kept in operation and rebuilt for making 1,000 B.t.u. gas, which would be the equivalent

of natural gas from Texas which has a B.t.u. content of about 1010, I believe, on the average.

Also, of course, in the original concept of the contract it was part of the picture that they should be used for peak shaving because it was anticipated that the peaks in Detroit would be quite large because it is a cold climate up there and very windy in the winter time and they need large quantities of house-heating gas to take care of the sudden peaks that come up.

You will find in the contract the stipulation that these plants should be maintained in operating conditions and also that the holders should be used for leveling the take of gas from the natural gas pipe line.

As I recall it, there were about 53,000,000 cubic feet capacity in holders which was spread out over some three [fol. 2023] or four or five holder stations and they were to be kept in operation to smooth out the takes of gas from the transmission line.

The contract was signed on August 31, 1935 and we started to get rights-of-way in Indiana and Ohio beginning that fall.

The Michigan Gas Transmission Corporation was organized, I believe, on November 4, 1935, but the contract could not be considered binding until after the consent decree had been signed, which was late in January, 1936. If my memory serves me right, it was January 29.

Construction on the line, we proceeded to get rights-of-way all the way through to Detroit, planning to utilize the existing pipeline of the Indiana Gas Transportation Company which extended from Dana to a point near Zionsville north of Indianapolis and then on to Muncie.

That line was a 20-inch line, as I recall it, as far as Zionsville and then 18-inch on to Muncie, but only the part as far as Zionsville was to be utilized in the construction of the Detroit line. That was a total distance of about 70 miles, and from there on to Detroit it was about 230 miles, through Indiana, the northwest corner of Ohio, and some distance in Michigan.

. . . . . .

[fol. 2024] That meant that we had to build 230 miles by the middle of the summer. Work couldn't start until early in April on account of the muddy condition of the soil. There were two contracts, one was with the Bibb Construction Company, who built the line as far as the Michigan-Ohio line, the other was the United Engineers and Constructors who built the line in Michigan. I have forgotten exactly that length, but I think it was about 65 miles.

Work was started early in April and at one time I think there were over 3,000 men on the job and they finished the job and got gas turned on, I think, on July 7, 1936. Actually it was officially turned on just a few days later, but immediately Detroit started their change-over they had some 425,000 or 430,000 customers whose burners had to be adjusted for natural gas, and that work was started in July, doing the work a section at a time. I think they divided the town into 26 sections, if I remember right and the work proceeded expeditiously until sometime in December when the change-over was completed and made effective January 1, 1937, at which time they were using complete straight natural gas.

[fol. 2025] In the meantime or shortly after that, we discussed the question of house-heating gas. As all operating men know, the load factor of house-heating gas is very low. It is around 26 to 28 percent and it is not particularly attractive business to the distributing company because it involves a large peak and in the case of Detroit with their demand and commodity rate it would involve a very high charge for that type of gas because on that load factor it would amount to around 65 plus cents per thousand feet of gas, so we concluded at that time that in order to develop the house-heating business in Detroit, which was good business as Detroit is a good market up to a certain point, that is, it is good business up to a certain point, we suggested a supplemental contract which fixed the load factor of house-heating gas at 50 percent, which meant a price of 4 cents per therm, a flat price of 4 cents per therm for house-heating gas. When I say "therm," I mean 100,000 B.t.u., which is equivalent to approximately 100 feet of gas, natural gas, so 4 cents a therm would be the equivalent of approximately 40 cents for 1,000 cubic feet.

It was stipulated in that supplemental contract that Detroit should have 20,000 house-heating jobs under that contract and more to be added later as the market grew and developed and in accordance with the conditions at the time.

That business developed very rapidly and starting out [fol. 2026] with around 500 house-heating jobs Detroit developed 20,000 jobs in the first two or three years and that contract was extended to 25,000 jobs, which I believe is now the present requirement.

In general, a house-heating job takes from 1700 feet to 2000 feet per maximum day so that 25,000 jobs would be the equivalent of 50,000,000 feet demand in one day.

Since that, due to the tremendous building activity in Detroit, there have been added a total of about 47,000 jobs at present, so the total take of natural gas in one day for house-heating only would be on the order of 80,000,000 feet. I cite those figures to give you some idea of the tremendous loads involved in taking care of that kind of business.

I think that brings us down to date. There has been various other supplemental contracts and while the first contract called for 90,000,000 feet per day, subsequent amendments have brought it up to 125,000,000 feet per maximum day, that is the capacity now that Detroit is entitled to take from the pipeline. I think that covers the point.

Mr. Baldridge: I would like to clear up something for the record. You say you signed a contract in 1935. You mean the 1935 contract was signed between Detroit City Gas Company and the Panhandle Eastern Pipe Line Company?

The Witness: Oh, yes, I was acting as agent for Pan [fol. 2027] handle Eastern and Burt Bay was president and he signed the contract in Detroit. He, of course, was familiar with what we were discussing and we kept him fully posted at all times as to our progress.

. . . . . .

Mr. Baldridge: Just to clear the record, also, the contract of March 17, 1936 was a contract which was signed

between Panhandle Eastern Pipe Line Company and Michigan Gas Transmission Corporation and that was the one which had to be approved and was approved by Mr. Gano Dunn as trustee.

The Witness: That is correct, I omitted to mention that. Gano Dunn had been appointed trustee of Panhandle Eastern Pipe Line Company under the consent decree and the contract between the two companies, between Michigan Gas [fol. 2028] Transmission Corporation and Panhandle Eastern Pipe Line Company, dated March 17, 1936, was approved by Gano Dunn as trustee and as I recall it was also approved by the Department of Justice. That is the contract that is now functioning between the two companies for a good share of the gas that is hauled by the Michigan company from Dana to Detroit and to other customers along the line.

There are some contracts that are made directly between Michigan Gas Transmission Corporation and customers in Indiana. I believe those are all listed in the record now.

. . . . . .

[fol. 2030] By Mr. Porritt:

Q. Mr. Beckjord what have you to say regarding compressor station erection on this line?

A. Well, to begin with the first compressor station was at Montezuma with two units of about 2600 horsepower.

[fol. 2031] That was the first winter. The second winter Zionsville station was constructed and the reason for the step-by-step construction method was that we were endeavoring to build capacity only as needed and this was later followed by additional units in those two stations and finally the construction of the Edgerton compressor station near Fort Wayne, Indiana, so that all three stations, Montezuma with six units of 7800 horsepower, Zionsville with 5 units of 6500 horsepower, and Edgerton with three units in active operation now and two more will be completed probably in December of this year, making 6500 horsepower there,—I think that adds up to 20,800 horsepower.

Q. Can you say what the capacity of the line was that was available for the winter period of 1937 and '38?

A. I think, to begin with, the capacity was about 70,000,000 feet of which 58,000,000 was for Detroit and then, subsequently, it was boosted up to 90,000,000 feet with about 83,000,000 for Detroit and in 19—perhaps I had better refer to a paper to make sure I have got that. In '36-'37 it was 70,000,000 feet, 58,000,000 for Detroit; '37-38 it was 109,000,000 feet with 84,000,000 for Detroit; in '38-39 it was 123,000,000 feet with 90,000,000 for Detroit; and in '39-40 the present capacity is approximately 160,000,000 cubic feet of which 125,000,000 is allocated to Detroit. That is daily capacity.

[fol. 2032] Q. Yes. What transmission facilities were added to increase this capacity?

A. Well, to begin with we utilized the 20-inch line already there from Dana to Zionsville, and later on that was looped in two jumps, the first one was, well, from the period I will put it '37 to '39. That 70 miles of line was looped with a 24-inch seamless steel line from Dana to Zionsville, which totals about 70 miles, and that completely loops the old line, the old 20-inch line.

Now, I might say that the new line to Detroit from Zionsville to Detroit is built for maximum working pressure of about 600 pounds. The line is designed for 700 pounds. It is a seamless steel line good for 700 pounds, but it is currently operated up to 600 pounds.

The line from Dana to Zionsville which was built about ten years ago in 1931 was built according to the then standards of construction for about 350 pounds pressure. That is, in general, the operating pressure that is used on the Columbia system from West Virginia up into Ohio, Kentucky and Pennsylvania and so forth.

It was felt advisable to use that line until its capacity was used up, first in order to save time because we were working against time to get gas to Detroit by July 1, 1936 and, second, to save the investment cost.

I believe, as I recall it, the total investment cost of the [fol. 2033] Indiana Gas Transmission Corporation which was taken over by Michigan Gas was approximately $1,800,000 or $1,900,000, I don't remember the exact figure, but that is in the record.

That was done to save time and to save the investment cost, but now that 20-inch line is completely looped with a 24-inch high pressure, seamless steel pipeline.

• • • • • • • • •

The total costs of this investment, this is the additional investment, is around $10,000,000, including the compressor stations and the transmission lines which are built to Detroit.

With the Indiana Gas Transmission system taken into it, the present investment cost totals around $12,000,000. The exact figure is in the record.

• • • • • • • • •

[fol. 2034] By Mr. Porritt:

Q. What tests have been conducted on the pipeline?

A. The original line, as I say, from Dana to Zionsville was constructed for 350 pounds, but that has since been tested up to 450 pounds and has proven very satisfactory.

There were some few leaks developed, but they were easily repaired.

The line from Zionsville to the Michigan-Ohio line is tested up to 600 pounds pressure and from there on in it has been tested up to 500 pounds for operating reasons, so the whole line is now fully tested and operating under those pressures I speak of.

• • • • • • • •

[fol. 2037] By Mr. Porritt:

• • • • • • • •

Q. What have you to say in regard to future construction?

A. Well, the line as now built has a capacity of approximately 160,000,000 feet and, of course, as the additional contracts that Panhandle has made up in Michigan come on and as additional growth occurs over the system, more compressors will have to be added and some more line-looping on the 22-inch section of the line.

[fol. 2038] We haven't made any great detailed estimates on the increased construction to be done, but on the

basis of the estimates that Panhandle made in their presentation here, we will have to spend about six and a half million dollars to bring the line up to sufficient capacity to meet their requirements. That is for looping and compressors, additional compressors.

Q. What equipment have you ordered for installation in the coming year?

A. Well, Montezuma is our key station and there are six units there now and we have ordered two more units. I believe they are working on 1300-horsepower units, which are promised for delivery some time in the middle of next year. It is becoming very difficult to get delivery on these units now. We have ordered them a long way in advance, hoping to get them. I believe they have an A-10 priority.

I am not clear as to just what that means, but I sincerely trust that they will be delivered next June so they will be in in time for the peak load next winter, that is, the winter following this one.

* * * * * * * *

[fol. 2041] Now, Detroit is what you call a one-industry city. It is practically all automobiles, and I have seen the time in my experience in Detroit when things were just as flat as a pancake, along in 1932 or thereabouts. As I recall it, the equivalent sales of gas in Detroit dropped to about 9,000,000,000 feet equivalent. Now they are up to say, 24,000,000,000 feet.

Well now, that is some spread and if you drop the sales of Detroit down to, say, half of what they are now, it would involve a very serious loss to the transmission company from Texas, which has built the capacity to supply the full load.

[fol. 2042] Now that, in my opinion, is a definite hazard. It may happen again. In fact, if the economists are right the depression after this war is going to be the worst that the world has ever seen. I don't like to be a pessimist and neither am I a prophet, but you can't help but read the future from the past sometimes.

* * * * * * * *

Likewise, we are meeting now, in our own system, quite a bit of competition from electricity. There are electrical

furnaces, both steel and brass, and they use great quantities of power. There are electrical heating furnaces for heat treatment of metals and with the tremendous amount of electrical capacity that is being installed now all over the country, when the war is over, believe me, there is going to be a tremendous amount of that energy for sale at very low prices.

The coal cost per kilowatt hour will probably be less than 2 mills and once industrial people get accustomed to using electricity they are very apt to continue to use it, [fol. 2043] and I would regard that as a very serious hazard in the possible future competition with natural gas, so that I don't think that anybody can rest assured that natural gas has a cinch in any industrial market. It is a very real hazard.

* * * * * * * * *

[fol. 2056] Mr. Littman: Hasn't Panhandle Eastern been installing compressor equipment along their lines in order to increase capacity?

The Witness: Yes, I believe they installed two or three compressors this last summer.

Mr. Littman: Isn't that going to give some increased capacity for this winter?

The Witness: Well, that may be on certain portions of the line, but my understanding is that the capacity at Dana at the point of delivery to us will be substantially the same as it was last winter.

* * * * * * * * *

[fol. 2057] Mr. Littman: Have you installed any compressor station equipment on your Michigan Gas Transmission System?

The Witness: Yes, we are putting in two more 1300 horsepower units at Edgerton station that is largely to take care of the hourly peak.

Mr. Littman: When will those be ready?

The Witness: I think it will be ready before Christmas, I hope.

Mr. Littman: Of course, that will increase your capacity?

The Witness: No, unfortunately not, that takes care of the hourly peak, but it does not necessarily mean a greater daily peak capacity for the reason that Detroit sometimes takes gas, I think it is, at the rate of seven or eight million feet per hour.

. . . . . .

The hourly rate, you see, is directly involved, because Edgerton station is only about 118 miles or so from Detroit and you can't pack the line a great deal in that distance and when the hourly peak is so high you have just [fol. 2058] got to keep the gas coming through all the time.

. . . . . .

[fol. 2108] Trial Examiner: At this time, we will receive in evidence the description of the physical property prepared by Mr. Young and marked for identification as Exhibit 77 and the System Map of the Michigan Gas Transmission Corporation marked for identification as Exhibit No. 78, without objection.

. . . . . .

[fol. 2119] P. McDonald Biddison, having been previously sworn, resumed that stand and testified further as follows:

. . . . . .

[fol. 2120] Trial Examiner: The Trial Examiner has assumed that a ruling on objections to reproduction cost evidence would be timely now when the cross-examination is about to commence.

Since the objection was first made, I have given renewed study to the Commission's precedents, to its rules and regulations and to such information as is available concerning the Commission's views and, after this study, I have concluded that the Trial Examiner should not burden the Commission at this stage of the matter with any presentation of this question for an interim formal ruling.

However, before any ruling is announced, I wish to give any further opportunity counsel may desire for further

argument, both in support of the objection or in opposition to it.

Counsel has presented fully in the previous sessions, considerations which are pertinent. I would, nevertheless, be glad to hear further from Commission's counsel if they have anything further to add and I will be particularly glad to hear further from counsel for the defendant company as to any facts in this record which distinguish this case from the Chicago District Electric Generating Company case to which frequent reference has been made and [fol. 2121] the reason why such facts, as you think may be present in this record to distinguish this case from that, would take this case out of the rule announced in that case and present this proceeding as something other than what the Commission has characterized as a normal rate proceeding.

* * * * * * * *

Mr. Littman: If your Honor please, we have heretofore stated, I believe quite fully, our reasons in support of our objection.

In view of the fact that your Honor has stated that you shall rule, I believe that it is your Honor's duty in these circumstances to follow the decisions and orders of the Commission.

I believe the precedent to be followed in this case clearly is the opinion of the Commission in the Chicago District Electric Generating case. I believe if that precedent is followed here, your Honor is required to rule out all evidence on reproduction cost.

I think all I need add at this time is that notwithstanding the repeated requests of your Honor that counsel for Panhandle Eastern come forward with facts or [fol. 2122] evidence or arguments that will or might distinguish this case from the Chicago District Electric Generating case, they have not done so.

Considerable evidence has been adduced by Panhandle Eastern since the objection was originally made. I have examined that evidence and I am unable to find any facts that have been presented that would warrant a finding by

your Honor that this case has been shown to be other than a normal rate proceeding within the meaning of that term as used in the Chicago District Electric Generating case.

So, in view of the record, the Panhandle Eastern Pipe Line Company having rested, and in view of the precedent established by this Commission, I believe that your Honor, under these circumstances, should sustain the motion to [fol. 2123] exclude reproduction cost evidence in this case.

* * * * * * * * *

Mr. Wheat: I wish to state, Mr. Examiner, that Panhandle Eastern has fully spread upon this record the reasons why it believes that a ruling a favor of the objection and the motion of Commission's counsel would be a denial of its rights under the Federal Constitution.

There is one additional point which I think should be made upon the record before any ruling is had and Mr. Culton, my colleague, would like to make that statement now.

Mr. Culton: The point, Mr. Examiner, is this:

The Panhandle Eastern Pipe Line Company, until the passage of the Natural Gas Act, was a private concern. Since the passage of the Natural Gas Act, its properties have been devoted to public use.

It recognizes the effect of the Natural Gas Act in that respect.

Now, for the first time, its rates are being subjected to regulation. A determination of the fair price for the commodity which it sells, necessarily, under the theory under [fol. 2124] which this case has proceeded requires an investigation into the earnings of the company and whether or not it is making undue profits.

Frequently it is said that investment should be the base from which that conclusion is determined. If that is true, then the investment of a company which was formerly a private concern and now has its property devoted to public use for the first time must, in our opinion, be the value of that company's property at the time it was either subjected to regulation or it became a regulated concern under the passage of the Natural Gas Act.

Whether or not that value should be the value of its property as in 1938 or the value of its property at this time is not necessary to be here discussed because, under either of those bases, value or reproduction cost new is admissible as a circumstance from which we can determine the present value of its property.

Whether it be an absolute standard for the present value of its property or an absolute standard for its value in 1938 is a different question just as original cost is a matter for consideration in determining the value of its property, both now and in 1938.

. . . . . .

[fol. 2125] Therefore, we insist that since our rates first became subject to regulation in 1938 and first became subjected to regulation under this particular proceeding, we are entitled to show the value of its property, originally, its value in 1938 and its reproduction value at this time, so that the Examiner and eventually the Commission may obtain a knowledge of the present fair value of the property so as to determine whether or not the rates now being charged are such as result in unusual and excessive returns on the value of the property which is applied to public use.

That is a reason which we offer in addition to those which were referred to by Mr. Wheat at a former time. We insist that the thing that the Commission is seeking is not to determine whether or not our rates could be reduced [fol. 2126] without confiscation but whether or not, treating us fairly and the public fairly, a present fair value of our property should be determined and a present fair rate of return applied to that fair value.

. . . . . .

Mr. Liftman: If your Honor please, I think a complete answer to the statement made by counsel for Panhandle Eastern was made by this Commission in the Chicago District Electric Generating Case, Docket No. IT-5500, Opinion No. 63, wherein the Commission said as follows:

"We have been authorized by Congress to determine the [fol. 2127] actual legitimate cost of utility properties and

the depreciation thereon, viz., the prudent investment. We have been directed to determine other facts bearing on the fair value of such property, such as reproduction cost, when found necessary for rate-making purposes. There is nothing which makes a determination of reproduction cost necessary for rate-making purposes in this proceeding. On the contrary, such a determination would be not only valueless, but, in fact, obstructive of the orderly regulatory process.

"We concluded, therefore, that the rate base in this case is the actual legitimate cost of the property used and useful in furnishing the service subject to our jurisdiction, less the existing depreciation in such property, plus the working capital necessary to render such service."

I respectfully submit that inasmuch as Panhandle Eastern has presented no facts or arguments, which would in any manner tend to distinguish the instant case from Chicago District Electric Generating case, your Honor is bound by the Commission's decision in the Chicago District Electric Generating Corporation proceeding, and should sustain our motion to exclude reproduction cost.

Trial Examiner: Anything further, gentlemen?

Mr. Wheat: Nothing further. We have stated our points in full.

Trial Examiner: In answer to Mr. Wheat's remarks and [fol. 2128] supplementing what the Trial Examiner stated at the outset, I would like to add that as the Trial Examiner is advised, it is the considered view of the Commission that procedural due process does not require the certification to the Commission of questions concerning the admissibility of evidence with formal action thereon by it during the progress of a hearing or a proceeding.

The correct view upon this subject seems to be that the Trial Examiner should rule upon the admission or exclusion of evidence in proceedings referred to him, in accordance with the opinions, orders and rules of the Commission, unless the Trial Examiner himself upon and only after a special showing by a party in a proceeding should determine that important distinguishing facts have been shown and that a necessity therefore exists for certifying

the question or questions relating thereto to the Commission for a special ruling or instructions.

To express this view in another way, it is considered that the Trial Examiner should rule upon all matters of admissibility of evidence in accordance with the opinions, precedents and Rules of Practice and Regulations of the Commission, applying these authorities as he understands and interprets them, and should take no question on the admissibility of the evidence to the Commission for special instructions and unless and only after it should appear to him that a party in a case has made such a special showing in some particular matter upon which it is necessary [fol. 2129] to rule as would seem to require a variation in the regular procedure and which apparently takes the case in hearing out of the effect and purview of the rule, principle or precedent already established.

In the instant hearing, where the respondents are seeking to introduce evidence of cost of reproduction in a case which to the Trial Examiner appears to be a normal rate case and similar in its material aspects to the Chicago District case, in which the Commission has in the past ruled out evidence of cost of reproduction, it is concluded that it is the Trial Examiner's duty to exclude such evidence on his own responsibility and without seeking special instructions from the Commission.

It appears to the Examiner that the Respondents' offer of such evidence has not succeeded in so differentiating and so distinguishing the evidence in hearing from evidence in the case in which the Commission ruled out such evidence and have not shown such necessity for this type of evidence as to make it necessary to carry the question to the Commission for special instructions.

The Trial Examiner feels that no such distinction or differentiation has been made as would take the case at bar out of the effect and principle declared by the Commission in the Chicago District case.

It is, therefore, the ruling of the Trial Examiner that the [fol. 2130] objections to the proffered evidence are sustained. The motion to strike the testimony relating to reproduction cost is also sustained and all evidence of re-

production cost will be excluded from the record of this case.

* * * * * * * * *

Trial Examiner: Of course, under this broad ruling, there is a definite exclusion of your proposed Exhibits Nos. 39 and 39-A, 37 and 37-A, and, while there may be other exhibits involved, in such event the broad ruling will, of [fol. 2131] course, determine as to them.

* * * * * * * * *

[fol. 2132] Mr. Wheat: May I suggest, Mr. Examiner, that Panhandle Eastern Pipe Line Company would like the record to show an exception, first, to the broad ruling which the Examiner has made in connection with the objection and motion of Commission counsel;

* * * * * * * * *

May the record show those exceptions?

Trial Examiner: Certainly, Mr. Wheat.

* * * * * * * * *

Mr. Wheat: And we would like to have it understood [fol. 2133] that our exception goes as a separate exception to each exhibit which is or may be comprised within the ruling so made, and to each specific item of testimony which may hereafter be found so to be comprised.

Trial Examiner: The matter of separate exceptions applies to matters which you have heretofore noted, namely, the ruling and the exception to the reference in the other matters included in your first request, but as to exceptions on rulings not yet made, namely, to the admission or rejection of specific exhibits, the exception is not yet applicable.

Mr. Wheat: May I ask, Mr. Examiner, in that connection, whether your statement means there is not now a specific ruling that Exhibits 39 and 39-A and 37 and 37-A and any other exhibits which may have been mentioned by counsel be excluded?

Trial Examiner: The Trial Examiner, I think, remarked that we know definitely that Exhibits 39 and 39-A, 37 and 37-A, are excluded under the broad ruling and, I believe, also Exhibit 62. Is that not your—

Mr. Wheat: (Interposing) I think that was the substance of counsel's objection.

Trial Examiner: (Continuing) Exhibit 62 was not included in the original objection but I assume it would clearly fall within the broad ruling. That was Mr. Biddison's study of depreciation and present fair value based upon the reproduction cost new less depreciation.

. . . . . .

[fol. 2135] Cross-Examination

By Mr. Littman:

. . . . . .

[fol. 2145] Mr. Littman: Mr. Examiner, I ask that a document entitled "Form A-2 For Corporations, Securities and Exchange Commission, Washington, D. C., Registration Statement Under Securities Act of 1933, Panhandle Eastern Pipe Line Company, Filed November 18, 1940, Effective Date January 29, 1941, Registration No. 2-4597" be marked for identification with the next number.

Trial Examiner: It will be marked for identification as Exhibit 106.

(Document referred to was marked exhibit No. 106 for identification.)

By Mr. Littman:

Q. Mr. Biddison, I hand you Exhibit 106 for identification and refer you to page 8-5 of the balance sheet notes of that document and I shall read from Note A (1) and ask you to state whether I am reading correctly from that [fol. 2146] exhibit. "A (1) Property plant and equipment is stated at cost except for $2,417,948.52 thereof assigned by the board of directors to assets acquired as of August 31, 1930 as a capital contribution, and intangibles are stated at cost except for $2,398,402.19 thereof assigned by the board of directors to gas sales and purchase contracts acquired as of August 31, 1940 as a capital contribution."

Have I read correctly from that document, Mr. Biddison?

A. Yes, Sir.

Q. In view of the statement which I have just read to the effect that $2,398,402 of the book figures which you

have used for cost of gas sales and purchase contracts does not represent cost, do you still feel that your claim for the amortization thereof is just and proper?

A. Well, I don't know that this says it doesn't represent cost.

Q. It says, does it not, that the intangibles are stated at cost except for $2,398,402.19, Mr. Biddison?

A. It does so state, but it does not state that the item of $2,398,402.19 does not represent cost.

Q. Have you seen that statement before?

A. I think so.

Q. Did that statement put you on guard and cause you to investigate or want to investigate it?

A. No, because I have made no investigation whatever [fol. 2147] to determine cost of property. I have taken a statement of property furnished to me by the controller of the company and have developed the schedule to amortize property shown on that schedule.

Q. In view of that statement certainly there was some doubt as to whether it represented cost, to say the least, was there not, Mr. Biddison, in your mind when you read it?

A. No, and there isn't now. I do not know but it is my understanding that it represents a cost, a portion of the cost of acquiring certain items.

Q. You certainly didn't give the public the benefit of the doubt in that matter, did you, by investigating whether it did or did not?

A. I didn't give anybody the benefit of the doubt because I did not investigate. I did just what I stated. I took the statement furnished me by the controller of the company and worked out the schedule from that.

Q. Now, Mr. Biddison, if it should be established by evidence other than that which has already been called to your attention that part of this amount of $2,930,286, which you have amortized in line 5 of page 3 for gas sales and purchase contracts represents—

Mr. Wheat: (Interposing) You mean line 25.

By Mr. Littman:

Q. (Continuing) Line 25 represents other than invest- [fol. 2148] ment you will agree, will you not, that your allowance to that extent should be reduced?

A. I have so previously stated.

Q. Now, Mr. Biddison, looking again at that figure for gas sales and purchase contracts, I note that you have amortized that amount over a ten-year term. I also note that that is the only ten-year term that you use in this entire exhibit.

Will you tell us why you used a ten-year term rather than a 34-year term or a 26-year term or other terms shown on that page?

A. Where I am amortizing in this instance an item of intangible value, I think it is customary in utility practice to amortize such items generally over short terms. It is being so amortized by Panhandle Eastern in actual practice. Those are the moving reasons for the adoption of a ten-year term.

Q. Is your claim for $293,028.64, annual accrual for gas sales and purchase contracts shown in column "I", included in the total of $887,646.60 shown at the bottom of page 3 of Exhibit 66? You will find that, too, on line 27, Mr. Biddison, the total that I read. A. Yes, it is.

Q. That total of $887,646.60 is carried over to page 1 in line 1, column "C" headed "Annual Accrual" is it not? [fol. 2149] A. It is.

Q. Now, as of what date of the year 1931 is the amount of $887,646.60 placed into the sinking fund shown on page 1 of Exhibit 66? A. At the close of the year.

Q. The close of the year 1931; is that correct, December 31, 1931?

A. Yes, sir. Its first interest earning was during the year '32.

Q. I see. And is this same amount so set aside on December 31 of each year thereafter? A. Yes, sir.

Q. How many times?

A. Well, it is set aside ten times.

Q. That is down to and including December 31, 1940?

A. That is right.

Q. Isn't it a fact, then, Mr. Biddison, that the sum of $293,028.64 annual accrual for sales and purchase contracts is shown on page 1 to have been set aside ten times by

December 31, 1940 and, therefore, completely amortized by that date? Is that correct? A. Yes.

Q. We don't need to include it then in 1941, do we?

A. Yes, sir.

Q. If page 1 is to be believed—

[fol. 2156] Mr. Wheat: (Interposing) What was the answer, Mr. Biddison?

The Witness: Yes, sir.

By Mr. Littman:

Q. Yes it does or yes it doesn't?

A. It is to be included because the item is not yet amortized.

Q. Mr. Biddison, you just said a minute ago that page 1 shows it to have been completely amortized by December 31, 1940, did you not?

A. No, I did not say it showed it to have been completely amortized. Page 1 shows that if this practice had been in effect it would be amortized. It is not amortized in fact at this date.

Q. Well, Mr. Biddison, what do you mean to show by page 1, then, where you show a reserve and the accruals in each year and the balance as of December 31, 1940? What is the purpose of it?

A. Simply to show what that would have amounted to had this practice been in effect from the beginning of operations of this company.

Q. Well, does it mean something or doesn't it mean something? A. It means what I have stated it to mean.

Q. Well, you are suggesting, are you not, when you [fol. 2151] claim these amounts annually and show this is reserves, that this is the method that be followed?

A. I am suggesting that this be the method to be followed, yes, sir.

Q. Ten years means that it should have been done, doesn't it, that is, that it should have been amortized?

A. I don't know whether it should have been or not.

Q. Well, at least the way you have set it up on page 1, it would be amortized, wouldn't it?

A. If it had been amortized as shown on page 1 it would be amortized. [Is] is, in fact, not amortized at this date.

Q. As shown by you on page 1 it would have been amortized, Mr. Biddison?

A. If it had been amortized as shown by me on page 1 it would now be amortized, yes. It was not so amortized and is not amortized at this date.

Q. Well, a good part of it has been amortized, hasn't it, as a matter of fact, Mr. Biddison? A. Yes.

Q. How much of it has been amortized by the company or didn't you investigate that either?

A. Yes, Mr. Watkins' exhibit will show how much residual balance there is of that account. On page 2 of Exhibit No. 52, by Mr. Watkins, is shown data relative to the [fol. 2152] matter about which you are inquiring.

Q. Well, suppose you tell us what that means, then; what data you are referring to.

A. Well, I am not in a position to explain Mr. Watkins' exhibit, but I will refer you to gas sales and purchase contracts, line 40, column "M" and to reserve for amortization of gas sales and purchase contracts, line 42, column "M".

Q. Yes, now which of those two figures did you use in your Exhibit 62 for amortization purposes?

A. I used line 40.

Q. That is, you used the figure of $2,930,286.40, did you not? A. Yes, sir.

Q. That is, you didn't deduct the reserve shown in line 42 of page 2 of Exhibit 52 in the amount of $1,611,657.30 did you? A. Certainly not.

Q. It had been written off prior to that time, the last amount that I read had been written off prior to June 30, 1941, had it not? A. It doesn't so show on this statement.

Q. Oh, it doesn't? A. No, sir.

Q. Well, answer this question, whether it does or doesn't [fol. 2153] show it, do you know whether or not that amount has been written off?

A. Oh, all I know about it is that that amount is carried on [thier] current monthly and annual operating statements as not being written off.

Q. Will you turn to Exhibit 69, please?

Assuming that that amount had been written off, it would have to be deducted from your $2,930,286 figure which you amortized, would it not?

A. If it had been written off as not representing investment, yes.

Q. That is, you are not suggesting and you wouldn't suggest, would you, Mr. Biddison, that the rate payer pay an amortization allowance annually on property that has been written off?

A. Well, I might, I don't know, I would have to know the specific case. I am not trying to do that in this particular instance that we are talking about.

Q. Well, suppose it had been written off. Suppose $1,611,657.30 of this amount had been written off by the company, written off its books prior to June 30, 1941. Assuming that to be the fact, would you still claim that it would be proper and just to have the rate payers pay an annual allowance for amortization on that amount written off?

[fol. 2154] A. I don't suggest that the rate payers pay any annual allowance for anything except simply to pay for gas. That is the only suggestion that I make about the rate payers.

Q. Well, aren't you suggesting that this Commission adopt your annual accrual figure for amortization of Panhandle Eastern Pipe Line property in the amount of $1,450,299? A. Yes, sir.

Q. And aren't the amounts we are talking about included in that total?

A. Yes, sir. And I suggest that it is proper to include in that total the amounts required to continue the amortization of that original amount until the amortization is completed.

Q. Of the original amount? A. Yes, sir.

Q. Of $2,930,286? A. Yes, sir.

Q. Well, Mr. Biddison, the original amount of that account as shown on page 2 of Exhibit 52 in line 40 was $13,398,402, was it not, in 1931?

A. $13,409,544.31, I believe.

Q. You didn't provide for the amortization of that original amount, did you? A. No, sir.

[fol. 2155] Q. Why?

A. Because of that original amount there is only $2,930,286.40 presently existing on the books of account as invested.

Q. That is to say, you didn't use the $13,000,000 figure because all but what you claim to be $2,930,000-odd was written off?

A. Yes, and I understand that the bulk of that did not constitute cost. That is my understanding of it.

Q. It was write-up, wasn't it?

A. I understand it was, I don't know. I didn't make a detailed investigation to find out.

Q. Which was another reason why you didn't want to include the entire $13,000,000 of cost?

A. Well, it is not there any more so there is no reason for me to include it.

Q. Well, the thing we are inquiring about now, of course, is to ascertain whether the $2,930,000 that you used is all there, too.

A. It so shows on the statement furnished me.

Q. All right, and, of course, if you misinterpreted that statement to the extent that $1,611,000 had been written off, if it should be shown that you misinterpreted it that way; your annual allowance would have to be reduced [fol. 2156] accordingly, wouldn't it?

A. I know that there are substantial amounts being accrued annually on the books and that the amount accrued to date has not amortized the $2,900,000-plus, therefore, the allowance should continue until the amortization of the original amount is completed.

Q. But it has amortized $1,611,000, has it not?

A. I believe that is correct.

Q. All right, turn, if you please, Mr. Biddison, to Exhibit 69, page 2. Refer, if you will, to column "C", lines 12 and 13, which read—well, refer to those and tell me how much you have included in the column "C" entitled "As Per Books" in that exhibit. That is, how much have you included for gas sales and purchase contracts, of course?

Mr. Wheat: You are referring to lines 12 and 13 of page 2 of Exhibit 69, are you?

Mr. Littman: That is correct, Mr. Wheat.

The Witness: That includes gas sales and purchase contracts in toto in the amount of $2,930,286.40 and I have shown a deduction of the reserves of $1,611,657.30 to arrive at the amount of $1,318,629.10 as being gas sales and purchase contracts less the reserves.

By Mr. Littman:

Q. As being gas sales and purchase contracts "As Per Books" Column "C"? Is that correct?

[fol. 2157] A. No, sir, as being gas sales and purchase contracts less reserves as per books.

Q. Yes, well you deducted the reserves of $1,611,657 on page 2 of Exhibit 69 as you state, did you not? You deducted that reserve here?

A. Yes, and so explained what it is.

Q. Yes. Why didn't you deduct it for purposes of amortization?

A. Because the amount that has to be ultimately amortized is $2,930,286.40 and I think it should be amortized over a ten-year period.

Q. Even though part of it has already been amortized and written off?

A. Even although there has been an accrual in their reserve account for part of it.

Q. And even though you suggest by your Exhibit 69 that the book figures to be used by this Commission for rate purposes should exclude the amount of the reserve?

A. I made no suggestion of any such nature with respect to my Exhibit No. 69.

Q. What do you show Exhibit No. 69 for at all then, what is the purpose of it?

A. The purpose of it is to show the amount to be deducted from a statement of cost as per books for the amount of depreciation which has occurred in the property.

[fol. 2158] Q. Well, would you say, Mr. Biddison, that it is a correct statement that that amount of $1,611,657 has been extinguished from the books of the company?

A. No.

Q. You wouldn't say that?

A. No. My understanding is that it is in the reserve account.

Q. I refer you, Mr. Biddison, to page S-7 of Exhibit 106 which is "Notes to Income Account" and I am going to read it. I am sorry I don't have another copy.

"Note B. The registrant has provided amortization of gas sales and purchase contracts in the amount of $24,419.05 per month which will extinguish the net ledger balance at December 31, 1935 ($2,930,286.40) over a period of ten years. Of the original amount of gas sales contracts, other, $371,000 is being amortized."

Well, the latter part, of course, has nothing to do with this particular item. First, have I read correctly from this statement?

A. Yes.

Q. Mr. Biddison, I will ask you to turn to page 1 of Exhibit 66, again. You have amortized the gas sales and purchase contracts over a ten-year period on a straight-line basis, have you not?

A. Yes, sir.

. . . . . .

[fol. 2177] Q. I refer you, Mr. Biddison, to Mr. Davis' Exhibit No. 76, Page 4, and ask you whether the following statement is the one on which you based the purported life of 34 years:

"The combined gas supply controlled by your company"—I think perhaps before I read that, for the purpose of the record, I had better state that this is a part of a letter addressed by Ralph E. Davis, Inc., Engineers, to the Board of Directors of Panhandle Eastern Pipe Line Company, New York, New York, dated November 12, 1940.

"The combined gas supply controlled by your company in the Amarillo and Hugoton fields is, in our judgment, adequate to supply its present markets and any reasonably anticipated increase in the gas requirement of said markets for a period of more than 25 years."

Is that the statement on which you relied?

A. I think that is not the sole statement. If I may be allowed to refer to the exhibit?

Q. Before you look up another statement, let's clear this up, Mr. Biddison, if you do not mind.

Is that one of the statements on which you relied?

A. Yes.

Q. All right, you may refer to the exhibit and tell me any other statements or data that you relied on in addition to that, if you wish.

A. The immediately preceding paragraph:

[fol. 2178] "Both the Amarillo and Hugoton fields constitute reservoirs of gas from which gas withdrawals will not

necessarily be proportional to the reserves controlled by various producers. The reserves are, we believe, sufficient to meet the combined anticipated requirements for pipe line, carbon black and other uses for a period of more than 25 years."

Q. The statement to which you just referred has to do with the Amarillo and Hugoton field as a whole, does it not?

A. Yes, sir.

Q. And the one I read had to do specifically with the reserves of Panhandle Eastern Pipe Line Company?

A. That is correct.

• • • • • • • • •

[fol. 2185] Q. Is Panhandle Eastern Pipe Line Company going to discontinue its leasing and its exploration activities as of June 30, 1941?

A. Not so far as I know.

Q. They are going, so far as you know, to continue and are presently continuing to explore and search for gas, are they not?

A. Yes, and to consolidate blocks and to avoid the ex-
[fol. 2186] pense of unnecessary drilling and of unnecessarily long and expensive gathering systems.

Q. Yes, they are going to go out and secure new gas reserves, aren't they?

A. I expect they will.

• • • • • • • • •

[fol. 2195] Q. Mr. Biddison, when did you first become employed by Panhandle Eastern Pipe Line Company?

A. I believe the first work I did for them was in the spring of 1937. I am not regularly employed by Panhandle Eastern Pipe Line Company.

Q. You are a consulting engineer for them and are called in from time to time to consult with respect to various phases of the operations of the property, are you not?

A. Yes, when they feel the need of my services.

Q. What have your duties been, generally, in that respect? I am not talking about this rate case now. We are all aware of your work in the rate case, but what have been your duties, generally, in the capacity of consulting engineer in the past?

A. Well, I have made some studies in the past on the question of the amounts to be accrued to reserve accounts.

Q. You mean reserve for depreciation or other reserves too?

A. For depreciation and depletion and amortization.

Q. May I interrupt there and ask for what years you [fol. 2196] made your recommendations with respect to accrual rates for depreciation reserves?

A. I have given the matter some consideration each year since 1937.

Q. Did you report to them?

A. I made no formal report to them on the matter whatever.

Q. Not in writing?

A. No, sir.

Q. Have you reported to the company orally?

A. Yes, and discussed the matter with them.

Q. Did you advise them as to what amounts they should charge, in your opinion, annually for amortization and depreciation?

A. It is more a question of my having examined what they were doing and reaching a conclusion in my own mind as to whether the amounts they were setting up were sufficient for the purpose.

. . . . . .

Q. Did you give them any advice about whether they should or should not amortize this organization cost and miscellaneous intangible plant cost?

A. No, I think the advice I gave them was only as to [fol. 2197] whether, as an over-all matter, the amount that they proposed to set up was sufficient for the purpose.

Q. Do you remember these two items?

A. Yes, I remember considering those matters, and forming my conclusions.

Q. You say at the time you made your studies preparatory to advising the company as to annual depreciation and amortization, you studied these two items, didn't you?

A. I gave them consideration in forming my conclusion.

Q. You did not tell them, did you, or you did not advise Panhandle Eastern Pipe Line Company to make an allowance for amortization of these two items, namely, Organization and Miscellaneous Intangible Plant?

A. I did not advise them to make an allowance for amortization of any item. I advised them as to my opinion as to whether their accruals in toto were sufficient for their purposes.

Q. And what was your advice in that regard?

A. My advice was that the amounts that they proposed to set up were sufficient.

Q. For what years, Mr. Riddison?

A. I think for the years 1937, 1938, 1939 and 1940, is my recollection.

. . . . . .

[fol. 2198] Q. What was your advice to them with respect to the accruals in their reserves for depreciation, depletion and amortization for those years?

A. For certain of those years, I advised that I thought that the amount of balances was normal for a property of that age and that condition.

Q. Do you remember which years?

A. No, I do not.

Q. Now, you stated you gave Panhandle Eastern some advice with respect to its depreciation policies.

Did Panhandle Eastern follow your advice?

A. I did not say that. I said that I had advised them as to my opinion of whether the amount they proposed to set up for these various years was adequate for the purpose or not.

Q. If the amount had been low, they would or would not do something about it, would they?

A. I do not know. I think that question should be addressed to them.

Q. Did they do anything about the depreciation—

A. (Interposing) The amounts they proposed to set up were arrived at after discussion between their employees and officials and myself.

Then, when a conclusion was reached and they proposed to set up those amounts, why, I concurred in the conclusion we reached and so expressed myself.

. . . . . .

[fol. 2199] Q. Did they take your advice with respect to the over-all amounts to be charged annually for depreciation, amortization and depletion?

A. It was not entirely my advice. It was a conclusion reached jointly.

Q. Suppose you tell us about it, Mr. Biddison?

A. I have told you. That is all there is to it that I can see.

We discussed the matter of what they were accruing. I made some computations of what I thought it ought to be for various classes and divisions of property and, in that manner, checked their ideas of what they thought ought to be accrued, and reached a conclusion as to how much it should be in toto.

Q. And out of the welter of discussion and conference, you and Panhandle Eastern were in agreement, were you not?

A. We got into agreement finally after these discussions.

Q. When? I mean, for what years?

A. I think it was for the years 1937, 1938 1939 and 1940. As I say, I am not certain offhand about the year 1937, but I believe those are the correct years.

Q. And you have already stated, no report was made by you in writing?

[fol. 2200] A. That is correct.

Q. No letter was written by you with respect to that subject?

A. Yes, I have written letters with respect to those subjects.

Q. Are those the letters that are contained in the Registration Statement?

A. Some of them have been used in Registration Statements, is my recollection.

Q. I take it that your answer with respect to an agreement on depreciation policy includes an agreement upon the adequacy and reasonableness and the propriety of the amounts accumulated in the depreciation reserves by Panhandle Eastern for depletion, amortization and depreciation? A. No, it does not.

Q. You did not agree with them? A. No.

Q. You did not agree at any time?

A. I have been asked my opinion on that and I have made some expression of my opinion on that.

Q. May I ask what those opinions were, sir?

A. Well, I think I had made the expression at some time or another, that I believed that the reserve balances were normal for a property of that age and of that condition.

I think I made some such statement as that in a letter.

[fol. 2201] Q. Well, can you state approximately when?

A. Well, sometime between 1937 and 1941, but I do not recall which year it was for. It may have been for more than one of those years.

Mr. Littman: Mr. Examiner, I would like to have marked for identification as Exhibit No. 107, a document entitled, "No. 11488, Committee on Stock List—New York Stock Exchange. Panhandle Eastern Pipe Line Company First Mortgage and First Lien 3% Bonds, Series B, Due November 1, 1960, Dated New York, February 28, 1941."

This appears to be an application for listing on the New York Stock Exchange of $12,000,000 principal amount of its first mortgage and first lien 3 percent bonds, Series B, dated November 1, 1940, and due [November] 1, 1960.

May it be so marked?

Trial Examiner: It will be so marked.

[fol. 2202] Q. Mr. Biddison, I read you a statement from Exhibit No. 107 for identification and ask whether it refreshes your recollection:

"The formulae consistently used by the Company and its Subsidiary Companies beginning with the year 1937 to develop an amount to be recommended to the Board of Directors as a proper provision for depreciation, depletion [fol. 2203] and amortization gives consideration to the 'wasting asset' theory and provides depletion on operated leaseholds on the basis of units of gas withdrawn, amortization of investment in unoperated land rights by the use of a composite life of ten years for such land rights, amortization of gas sales and purchase contracts at a

specific monthly rate as provided in the Company's Certificate of Incorporation and in amounts to conform to the contract period in certain instances, and an amount for the other transmission system properties determined by its Board of Directors which recognizes amortization in addition to a composite rate based on the age and estimated life of the properties. The propriety of the aggregate annual provision, as well as the reasonableness of the total reserves provided to date, has been substantiated by an opinion from an independent Consulting Engineer. Unless required to do otherwise by some regulatory authority of competent jurisdiction the Company expects to continue this policy."

I have read the last paragraph on the first page of that application.

Does that refresh your recollection as to whether you are the consulting engineer referred to in that statement?

A. Well, I assume that I am. I have worked with them on that matter.

Q. You do not know of any other consulting engineer [fol. 2204] that worked on that matter in 1939 or 1940, do you? A. No.

Q. Let me ask you, does this refresh your recollection as to the date as of which you advised the company as to the reasonableness of the total reserves provided to date of Panhandle Eastern Pipe Line Company?

A. I think I did something of that sort late in 1940.

Q. It is your best recollection it was late in 1940 that you did come to that conclusion?

A. Yes, I think I advised them of substantially the same thing, maybe at other times.

* * * * * * * * *

[fol. 2290] P. McDonald Budison, resumed the stand and testified further as follows:

Cross-Examination (Continued)

* * * * * * * * *

[fol. 2413] P. McDonald Biddison, the witness on the stand at the time of the taking of the noon recess, resumed the stand and testified further as follows:

* * * * * * * *

[fol. 2421] Cross-Examination

[fol. 2422] By Mr. Chamberlain:

Q. Mr. Biddison, I wish to call your attention to a portion of your testimony given yesterday in which the question was asked you with respect to the reserve account which is created under the plan of your Exhibit 68.

You were asked by Mr. Littman, as I read the transcript:

"Question: Can you enlighten us any further with respect to what is proposed to be done with it?

"Answer: Well, the money will be accrued in a reserve account and the retirement of property removed and abandoned will be charged from time to time against that reserve."

"Question: In other words, if I correctly understand you, Mr. Biddison, this annual amount of $675,573 will be credited to a reserve each year and whatever replacements are required from year to year will be charged to that reserve?"

"Answer: Whatever retirements are made, retirement and abandonments."

That is what you intended to answer? A. Yes, sir.

Q. Now, you stated yesterday that a retirement on account of the condition of the property constituted what you called a "mortality", is that right? A. Yes, sir.

Q. Now, you distinguish that as a deterioration, or you would consider that such a deterioration as distinguished from a change that was made on account of a [fol. 2423] public requirement or inadequacy?

A. Yes, sir.

Q. Now, what are the factors which you found in your studies because of what you term "mortality of pipe"?

A. The mortality of pipe is quite largely caused by corrosion of one sort or another.

Q. Well, you said this morning, if I recall correctly, that about three-quarters of the retirements were caused by corrosion, is that right?

A. Yes, sir, that is my estimate of about the proportion.

Q. What are the factors which constitute the remaining quarter of the reason for mortality in pipe?

A. Well, there are the requirements of public authorities, inadequacy.

. . . . . .

Some due to obsolescence.

Q. Anything else?

A. That is all that occurs to me at the moment. Those are the causes I have in mind.

Q. Now, you had the experience of a long study with [fol. 2424] respect to the Lone Star system, did you not?

A. Yes, sir.

Q. Now, you have known that property for many years, Mr. Biddison, have you not? A. Yes, sir.

. . . . . .

[fol. 2426] Q. How long a time did you put in on the study as to the amount of pipe turn-over on that system?

A. I do not know. I have worked on that at various periods for a considerable time and I have had help engaged on it for, I guess, it will amount to probably two years total time of a man but I have not been continuously on it so very much myself.

Q. Well, you have reached conclusions from the research and study that has been made by your staff?

A. Yes, and from studies made by other engineers working on the same problem for Lone Star Gas Company. I have used some of their data and they have used some of mine.

Q. And without asking at the present time as to any result of your work for Lone Star, I do want to ask you to be a bit more specific as to the causes of deterioration now which you found were factors in causing the ultimate retirement of pipe. You certainly have more than two or three?

A. As to well lines and gathering lines, the most important factor has been the life of wells and fields. That

has caused line and pipe removals but I have not embraced those in the figures which I have cited for main lines.

. . . . . .

[fol. 2427] (interposing) I might class those under the heading of either obsolescence or changed operating conditions.

. . . . . .

Now, the Lone Star has also had some heavy removals of pipe in their main line system due to the factor of changed operating conditions which we might class under the heading of obsolescence.

That is, they became obsolete in the location they were in and on that account, some major removals of lines have been made.

There are also the requirements of public authorities that have caused some removals and abandonments of pipe by the building of new roads, the changing of grade on roads, items of that sort.

Those items have been material in connection with the history of Lone Star removals and abandonments of pipe.

Then, the factor of pipe mortality due to pitting, the result of corrosion.

Q. Now, I understood you to say that your study confirmed the fact that they had about a 4 percent annual turn-over in their pipe due to all of these causes.

A. That is right.

Q. And that about 1.7 percent was due to the factors which caused deterioration in the pipe? A. Yes, sir.

. . . . . .

[fol. 2428] Q. What are the factors which would be operating within this 1.7 percent that caused the deterioration of the pipe other than corrosion now which you have mentioned?

A. The main factors in that are corrosion.

Q. Well, is that all?

A. I think that is the only factor in that particular item.

. . . . . .

Q. And by the same token, I judge that the one percent that you assert will be suffered by Panhandle Eastern will be due, then, to corrosion?

A. No, I think not. One percent covers all costs.

Q. Covers all costs. That is, you mean those due to inadequacy?

A. Inadequacy, public requirement and changed operating conditions.

* * * * * * * * *

[fol. 2430] Q. Well, now, it is a fact that Lone Star had a very small proportion of what we call the larger pipe, has it not?

A. Well, the Lone Star does not have any material amount of pipe as large as that of Panhandle Eastern, but they do have a considerable amount of 20-inch and 18-inch, 16-inch.

* * * * * * * *

[fol. 2432] Q. Now, are there any factors which were present in the Lone Star system that would not be present in the Panhandle Eastern system?

A. Yes.

The factor that the Panhandle Eastern Pipe Line system has better protective coating than on the bulk of the pipe in the Lone Star Gas system, is one.

Another factor of difference is that the Panhandle Eastern Pipe Line Company system draws its gas from two large fields, both of which have already had comparatively long lives and each of which will produce for a great many future years, so that the location of the main pipe line system of Panhandle Eastern is in a relatively fixed position for a considerable period of time to come, as compared [fol. 2433] to the system of Lone Star Gas Company which, beginning with 1909, has had to shift its source of supply in whole or in part, several times, requiring considerable rearrangement of its system.

Q. How many fields have they extended their lines to, to obtain gas?

A. I do not know that I could break it down for you into fields. I could name it to you, I think, suitable for your purpose in areas.

Q. All right.

A. They began operations with their supply based upon the Petrolia Texas fields near Wichita Falls and then extended northward from there into Oklahoma into the Chickasha and Duncan area.

The supply was augmented along about 1917 or 1918 by a line from the Fox Loco area of southern Oklahoma, that area being near Ardmore.

Then, about 1920 or 1921, they extended their system out into the Eastland-Breckenridge-Ranger area, that being westward from Fort Worth.

Then, in 1926, they brought in gas from the eastern portion of the Texas Panhandle Field through an 18-inch line running down to Petrolia. Then about 1935, they extended their supply system down into east Texas, Cayuga, Long Lake, and Buffalo fields, generally near Palestine south of Athens.

[fol. 2434] Those have been the major changes in their supply sources.

Q. They have involved the abandonment of much of the gathering system, have they not, in those various fields?

There have been constant changes?

A. There has been a considerable amount of abandonment and removal of field lines in that connection. Very few of those fields, though, are totally extinct or totally abandoned yet.

* * * * * * *

Q. You stated that you felt that on the Panhandle [fol. 2435] Eastern system the retirements would be materially less due to mortality than on the Lone Star system.

Now, what factors do your figure will be involved in that and which factors will operate to a lesser extent?

A. The factors which I think will lessen the amount of retirements due to corrosion is the protective coating on the system of Panhandle Eastern Pipe Line Company.

Q. And you did not expect to have any great amount of inadequacy in these lines for some time?

A. I think there will be some inadequacy, but I do not think that will be remedied by retirement and substitution of larger lines.

I think that it will be remedied by property additions.

Q. There has been a constant improvement in the way of the protective covering for pipe line, has there not, in the past ten years?

A. Only in the respect that we do have some mechanical methods of application. So far as the quality of the protection itself is concerned, I do not think there has been any material improvement.

The methods of application have been improved but I do not think that the materials themselves have shown any appreciable improvement. I know of nothing to indicate it.

Q. What are the factors that cause corrosion?

A. The factors that cause corrosion are dissimilarity [fol. 2436] of metals in contact with soluble salts or acids.

Q. And does that occur on the exterior of these mains entirely?

A. No, it does not entirely. When we speak of mains, I am speaking of mains in general now, not of any specific company's mains.

Q. Yes, and corrosion occurs then due to what causes?

A. Interior corrosion on pipe lines is generally caused by the presence of sulphur compounds, free oxygen, and moisture.

Q. Well, is there free oxygen in natural gas?

A. There is occasionally reported a trace of free oxygen in some natural gas analysis. As a general proposition, I think that that is an error in sampling or in analysis.

I do not believe that free oxygen really exists in natural gas, although occasionally an analysis will indicate a trace of it but, in connection with the operation of oil wells, it has been commonly found that air, with its oxygen content, would be mixed with the casing head gas from some

of these oil wells or casing head gasoline plants and some such gas is used in natural gas pipe lines in some localities.

Q. That would be only where they were buying casing head gas then?

A. That is the only place I know of where you can expect any oxygen in natural gas.

Q. And do they have any nitric acid corrosion?

[fol. 2437] A. I know of one instance where there was a nitric or nitrous acid corrosion on the interior of pipe in connection with the use of gas engine exhaust gases and stack gases off a steam boiler for dilution for control of the heating value.

That is the only instance I know of, of that class of corrosion.

Q. And do you know of substantial amounts of pipe that had been removed on account of that type of corrosion?

A. Yes, I know of several miles of 18-inch, I believe it was, removed on that account.

Q. But that is not a factor you would expect to find in Panhandle? A. No, sir.

. . . . . .

Q. Now, I wish you would describe for us the gasoline extraction plant that is in operation on the Panhandle system.

. . . . . .

[fol. 2438] A. I can give you the elementary process, at least.

The absorption process is the one that is used at the Liberal plant. In this process, natural gas is brought into the base of a vertical cylinder. As a matter of fact, they have several of these vertical cylinders, called absorbers.

The gas passes upward through these absorbers and in its upward passage, it is brought into intimate contact, through baffles and trays, with a descending stream of absorbent oil which is pumped in at the upper portion of this absorber.

The oil, in contact with the gas, absorbs from the gas some of the liquid fractions which have been carried in solution in the gas.

The natural gas is drawn off from the top portion of the absorber and passed on into the pipe line.

In this particular plant at Liberal, this gas, after having passed through the absorbers and had its gasoline content absorbed, is treated by a somewhat similar process in another apparatus where it is contacted with a liquid which absorbs water from it and the gas is, in that fashion, dehydrated.

From the absorbers, however, of the gasoline plant proper, the enriched oil is drawn off at the bottom continuously and passed to a still, a rectifying outfit.

In its passage to this still, it passes through some heat- [fol. 2439] exchanging apparatus so that it may pick up and utilize the heat in some of the oil that had already been denuded of its gasoline content in that still.

In the still, this enriched oil comes in contact with free steam. The combined effect of the heat imparted by the steam and the lowering of the vapor-pressure on the gasoline fractions in the oil due to the presence of the water vapors, causes the gasoline vapors to separate out from the oil vapors and they ascend in a dephlegmator column in which some partial condensation takes place and the small amount of the absorber oil that had been carried upward by those vapors are returned to the still and the gasoline fractions go off at the top, where they are carried to condensing apparatus and cooled down.

They may be, in this process, cooled completely in one operation, or cooled in several operations, and the gasoline so produced be produced in two or more fractions of different quality and the gasoline may be subsequently treated, if desired, in other fractioning apparatus so that its vapor tension may be controlled.

That is the general process.

Q. Well, now, what products, or what ones of the heavier hydrocarbons are taken out at this plant?

A. Well, those heavier hydrocarbons which are salable as natural gasoline and the general process in that respect would be to strip out everything heavier than butane; [fol. 2440] probably, and possibly take out some of the butanes and propanes.

. . . . . .

Q. Now, what parts of that plant would require replacement to the extent of 5 percent a year, $35,000 a year?

A. Well, I do not anticipate that any one particular piece of it will take $35,000 in a year. I anticipate, however, that on the average they will be required to replace that much per year because of the using up of apparatus, cooling tower coils are rather expensive pieces of apparatus and they do not last for ever in spite of the fact they are made out of brass tubes.

The cooling towers themselves require replacements, especially the towers, in spite of the fact that they are largely made out of redwood.

[fol. 2441] Pumps require replacements. Valves and fitting require replacements, instruments and controls require replacements. It is an over-all figure for a property of that class.

. . . . . .

Q. You would be able, I take it, to name any parts which would even approximate $35,000 a year for replacement, would you not, Mr. Biddison?

A. That is correct.

Q. And the plant would be of service until such time as it should be abandoned for some new type of equipment other than very moderate cost for replacements, is that right?

A. I have it in mind that plants of this type will be overhauled and modernized occasionally in order to be kept up to modern standards of efficiency.

Q. And how frequent would you expect that?

A. Well, I think there will be major changes in such a plant every ten, fifteen years. There would be major changes in the layout and design.

[fol. 2442] Q. Now, on the sheet from Mr. Watkins' working papers, there is indicated a retirement from this gasoline extraction plant of $35,806.35 in 1940.

Do you have any knowledge of what that was?

A. I think that that was in connection with the dehydration equipment. There was some dehydration equipment removed at about that time, either 1940 or 1939, I have forgotten definitely which.

. . . . . .

Q. That was designed as an improvement in the art?

A. As an improvement in the art and to provide additional dehydration capacity.

. . . . . .

[fol. 2462] Q. Wouldn't it be more accurate for you to say, Mr. Biddison, that the balance in a reserve built up by proper charges through the years does not at any given period represent the depreciation which you claim you cannot observe? Wouldn't that be more accurate for you to say that?

A. No, I think that would be less accurate. My statement is that it would only by a rare coincidence equal depreciation which has occurred in the property.

Q. Do you believe that annual allowances for depreciation should be harmonized with the amount to be deducted for existing depreciation?

A. I do not, I do not think they can be rationally harmonized.

Q. Mr. Biddison, I read you from pages 21 and 22 of the Federal Power Commission's Opinion No. 63 in the Chicago District Electric Generating Corporation proceeding, Docket No. IT-5500:

"The true conception of depreciation leaves no room to doubt that annual depreciation expense and actual existing depreciation must be harmonized. Annual depreciation measures the diminution in service life, capacity or utility in one year—actual existing or accrued depreciation is the total diminished service life, capacity or utility to the date of inquiry. To accept the one while denying the others is to be illogical and guilty of employing a dual standard with resulting injustices to the public or to the utility."

[fol. 2463]

Do you subscribe to the principle which I have just read?

A. I certainly do not. I think if they had had as much contact with property as I have had they wouldn't agree to it themselves.

Q. Well, we wanted to make certain that we understood your theory, Mr. Biddison.

When you speak of a replacement, do you mean the replacement by property of like purpose replaced in kind without betterment? A. Yes, sir.

Q. What is the distinction in your theory between addition, addition replacement and betterment?

A. Well, an addition would be the creation of a piece of property where none existed before. A replacement would be to take out one unit of property and put in its place a like unit. A betterment might or might not involve a renewal. It might be to take out one unit of property and replace it with a better or bigger or more efficient unit to serve a similar purpose. On the other hand, it might involve merely the working over of the [fol. 2464] existing unit to make it a betterment, some modernization of it.

Q. Can you predict any major retirements to be replaced in kind with property of like purpose without betterment?

A. Well, I think most any such replacement would result in some betterment, but that is not betterment as I understand the word used in classifications of work.

Q. Mr. Biddison, if an amortization plan is followed whereby each dollar of plant investment is amortized over its remaining life, would there be any need for any replacement allowance in addition thereto?

The Witness: May I have that read back?

(Whereupon, the pending question was read by the reporter.)

The Witness: Well, that would be a replacement allowance.

By Mr. Littman:

Q. As well as an amortization allowance?

A. It would be a replacement allowance on an amortization schedule.

Q. And, of course, no separate allowance for replacements would need to be made?

A. It would be the allowance for replacements.

Trial Examiner: You, nevertheless, propose that the [fol. 2465] annual accruals estimated in your Exhibit 66 for identification and your Exhibit 68 for identification shall run concurrently until the exhaustion of the field, do you not?

The Witness: That is correct.

By Mr. Littman:

Q. Mr. Biddison, I asked you a moment ago whether you predict any major retirements of property to be made in kind of like property without betterment. I believe you responded rather generally. Can you be more specific, can you name any major retirement that you expect will come about which will be replaced in kind with property of like purpose without betterment?

A. Yes. If a stretch of pipe be taken out of service because it is so badly pitted it is no longer suitable for service, it may well be replaced with an equal amount of pipe of the same size and character and with the same kind of protective coating thereon.

Q. With the same life expectancy?

A. With the same life expectancy in the same location.

Q. Can you name something other than the pipe that would come within the category that I described?

A. Yes, you can replace a valve.

Q. I said a major replacement, Mr. Biddison. I don't mean a valve or one piece of pipe, I mean something of major size.

[fol. 2466] A. Well, take a compressor unit. If one of the 1300 horsepower compressor units were required to be replaced at this date, it would be replaced with a unit substantially identical in all respects that would sit right on the same foundation.

. . . . . .

Q. Mr. Biddison, is it a fair deduction from your testimony that it is your judgment that this main transmission pipe such as is in place in the Panhandle Eastern system will have an average life of 100 years?

A. No, sir. The only thing that can fairly be deduced from my testimony in that respect is that I don't know what its average life is going to be and I don't think there is any method by which it can be foretold. I can make an estimate of what I think the replacement rate will be on it.

Q. And that rate is 1 percent a year?

A. That is correct.

Q. And does not that imply, then, an estimate of 100 years? A. It does not.

Q. At least 100 years?

[fol. 2467] A. It does not. I have tried to make it plain that I do not think average life can be determined from the replacement rate on steel pipe nor can the replacement rate be determined from average life. It makes no difference in the long run what the average life might be if you do know what the replacement rate is apt to be.

Now we can make some rational determination of what replacement rate is apt to be on steel pipe by a study of what replacement rates have been on other lines. We cannot make any determination of the average life of steel pipe in anybody's transmission system today, because to make a determination of the average life of steel pipe requires that steel pipe in some pipeline go through a life cycle. I do not have and have not heard of and cannot find out about any pipeline on which it can be said there has been a complete life cycle.

Q. And how long have steel pipes been in use?

A. Steel pipe has been in use in pipelines since 1898.

Q. That would be 43 years? A. That is right.

Q. And pipe that was put in at that time is still in use, is it not?

A. Well, I do not know whether pipe that was put in at that time is still in use or not. Steel pipe came into [fol. 2468] use for pipelines at about that time. The first steel pipe that was ever made was made about 1885, but in most all pipelines we find sections in which pipe will have a relatively short life, other sections in which it will have a relatively long life.

Now, if we have a pipeline in which 10 percent of the line is in what we might call hot spots and has to be

replaced at frequent intervals, say, that pipe has to be replaced every ten years, we might have 90 percent or the remainder of the line would be in a location where pipe wouldn't have to be disturbed for, well, say, 35 years.

Now, the average life of pipe under that condition is 32 and a half years. We have a replacement rate on it, however; during the 35-year period we will have replaced 10 per cent of it three and a half times and we will have replaced 90 per cent of it once.

Now, the replacement rate doesn't figure from that average life figure at all and you can take other combinations that will give you the identical average life and have entirely different replacement rates.

Q. Well then, how can you judge a replacement rate for Panhandle Eastern by taking the rates that you have found in other locations?

A. Simply because other locations cover a wide variety of conditions.

[fol. 2469] Q. They would have to be similar conditions, would they not?

A. Well, they would have to have variety enough that you wouldn't be confining yourself to a few of these hot spots.

Q. Well, if you leave the hot spot alone, leave that out of your calculation, how long do you estimate that steel pipe will last?

A. Well, I have no estimate on it. I have nothing on which to base an estimate. If we have no hot spots and no attack, I have no basis on which to estimate life.

Q. Well, isn't your estimate in this case based upon the same theory that is so often given for determining the life of cast iron pipe, a hundred years is long enough to estimate?

A. No, sir, it is not. It is not based upon that at all.

Q. I observe in your Exhibit No. 68 that you carry out the replacement rate on your transmission mains for the full 34 years. You have, however, a retirement of your Texas lines eight years before that period in which you would have pipe for use in replacing anything that went out. Why do you carry this for the full period?

A. Why, I do not carry this Exhibit 68 for any period. I have simply set up here what the present rate of accrual [fol. 2470] should be for the presently existing property. Now, as that property changes, the total amount of the accrual should change. There would be no accruals for the Texas property after it had gone out of service.

Q. Nor would there be any accruals for the balance of the property, because you would have pipe enough to replace anything you needed. I am speaking, of course, of the cost of pipe.

* * * * * * * *

The Witness: I don't understand that.

Q. I was trying to say that there would be no need of an accrual after 1957 for pipe on this transmission system because you would have pipe enough retired from your Texas division and yet you have carried your accrual through for the full period at the full amount.

A. I have carried the accrual only to the extent of showing what the annual rate should be of accrual. I haven't set it up for any period and carried it through to 1965 or to any other period. There would be no accruals whatever, either for the retirement schedule under my Exhibit 68 or for the amortization schedule of my Exhibit [fol. 2471] 66, for the Texas property after it went out of service.

Trial Examiner: As a matter of management then, Mr. Biddison, would it be proper to assume that periodic revisions of this estimation in Exhibit 68 would be made from time to time in the light of experience and the charges to the consumers adjusted accordingly?

The Witness: Certainly, Mr. Examiner. The determination of the rate of accrual for retirements and of the rate of accrual for amortization must be analyzed annually in the light of the changes that have taken place in the property and in the investment in property. No one can determine at this date a fixed figure for either purpose which will properly apply after the property value or the character of the property has changed.

Trial Examiner: And to follow that up somewhat conversely, why is there such a marked uplift in the trans-

mission line charges as compared with the actual experience of the company to date in replacement costs?

The Witness: The company should have been accruing what we might call a contingent fund to meet the impact of heavy retirements with which they will soon be faced. At the time those retirements are to be made there must be enough money accrued in the reserve to meet their cost.

This pipeline system has generally upon it a high-grade [fol. 2472] protective coating which has deferred the attack of the elements on the pipe and has deferred corrosion and pitting. That protective coating will not last forever. None of them do. Cold applications are good in some locations for a few years. The hot applications, such as this system has quite largely, are good for a few years longer. None of them are effective protection for a great many years.

As that protective coating breaks down the rate of corrosion and pitting will increase quite rapidly and they will be faced with a series of pipe replacements far in excess of the annual rates which I have here set up to be made in the course of two or three years to put that pipeline system in condition to continue to operate under the conditions for which it is designed.

After having one cycle of those heavy replacements, according to the experience that has been had by all other operating companies with whose experience I have had contact, they will have a little relief on replacements for a while. The rate of replacements will fall below the average rate only to be followed by another peak, probably of less intensity than the first one, and the replacements will run in cycles in that fashion.

It is for that reason that these amounts should be accrued in a reserve fund. If they were going to be expended at a uniform rate, there would be no use for a reserve fund. There would be no sense in a reserve fund. [fol. 2473] You would simply charge it directly against operations.

* * * * * * * *

[fol. 2481] P. McDONALD BIDDISON, a witness having been previously duly sworn, resumed the stand, was examined and testified further as follows:

* * * * * * * *

[fol. 2527] Q. Mr. Biddison, will you state in a general way just what items you propose to recover by the accrual under your Exhibit 67?

A. As shown on page 1, the cost less salvage of gas leases and of the wells drilled or to be drilled thereon.

Q. Does that include any provision for abandoned leases?

A. Yes, they are to be recouped through this depletion charge.

Q. Well, does your provision now recoup the company for the matter of the abandoned leases? A. Yes, sir.

Q. And in what way does it do that?

A. By accruing for the total cost of leases.

Q. Well, but you have the cost of present leases, do [fol. 2528] you not? A. Yes, sir.

Q. And have you added in anything for the cost of such future leases as you may have to purchase when an abandonment occurs in the field? A. I have not.

Q. How have you provided for the cost of abandoned leases?

A. Any leases which they now have which are going to be abandoned will be recouped through this charge, because their value is in the lease value which I have used.

Q. That would cover, then, presently existing leases?

A. Yes, sir.

Q. Now, how would you define depletion?

A. You mean as something which happens to the producing property or do you mean as an account on the books?

Q. Well, let's have it both ways, if there is any difference.

A. Well, as applied to the producing property, depletion means the diminution in the quantity of the product with which we are dealing. In the case of gas it means the lessening of the amount of gas possessed by the company.

Q. In other words, gas is a wasting asset?

A. Yes, sir.

Q. And the loss of the store of gas by use is really [fol. 2529] the depletion in that reserve, is it not?

A. Yes, sir.

Q. Now, you are giving evidence, of course, for the determination of rates, are you not?

A. Yes, sir.

Q. And was it your aim to follow the provisions for accounting for depletion that have been laid down by the Federal Power Commission?

A. No, my aim was to provide the requisite amount of money.

Q. Without regard to the accounting that is prescribed? A. Yes, sir.

Q. Let me ask you this, you gave me but the one definition. What is the definition as an accounting matter?

A. Well, a depletion reserve is a reserve account—

Q. (Interposing) Depletion, we were talking about, not the reserve. You mentioned that there was a difference between depletion from an accounting standpoint and from a physical or economical standpoint, I believe.

A. In accounting, as I conceive of depletion, it is an adjective modifying the noun "reserve", and, in that sense, depletion reserve is that reserve account in which may be accrued annual amounts proportionate to the amount by which the property has been depleted sufficiently to accrue the cost of the reserves by the time they are completely depleted.

* * * * * * * *

[fol. 2530] Q. Now, reading from Definition 13 of the System of Accounts promulgated by the Federal Power Commission, effective January 1, 1940, I find that—

"Depletion, as applying to natural gas producing land and land rights, means the loss in service value incurred in connection with the exhaustion of a natural resource in the course of service."

Now, that means the loss in value, does it not, of the investment used in public service, loss in service value?

A. I presume that is what it means.

Q. Now, on the matter of the abandoned leases, it is always an indeterminate amount, is it not, that is, as applied to the future?

A. It may be in some instances and, in other instances, the amount can be fairly closely predicted.

Q. Well, you mean that you can predict the number of leases that will be abandoned in that amount of acreage covering a period of 25 years?

A. No, I do not mean that I can. I simply mean that, in some instances, the prediction of the amount of abandoned leases might be impossible. In other instances, it might be done with a fair degree of accuracy.

[fol. 2531] Q. Well, now, if there is no attempt to determine that or to speculate on it, one can charge them off with absolute accuracy as they occur, can he not?

A. Yes.

Q. So that there is no reason for making an estimate as to the future cost for abandonment of leases?

* * * * * * * *

The Witness: Well, I think some determination of it must be made in matters of this sort, one way or the other. Certainly some provision must be made for it.

Q. Well, assuming it to be a charge against operation, that can be made without any necessity of speculation at the time it occurs, can it not?

A. At the time it occurs, there is no speculation about it in any event.

Q. No, that is factual, isn't it?

A. It is written off in one shape or another after it is known what the amount happens to be. There is no speculation about the amount to write off.

Q. Well, there is no real reason for speculating as to what that will be, is there, Mr. Biddison, in accounting?

A. Not in accounting, no.

* * * * * * * *

[fol. 2534] Q. Now, did you observe Account 503.2, which is the Utility Income Account under the Uniform System of Accounts?

A. Well, I have seen it, but I did not refer to it in this respect at all.

Q. Did you observe this provision?

"B. The charges to the account shall be made in such manner as to distribute the cost of producing natural gas

land and land rights over the period of their benefit to the utility based upon the exhaustion of the natural gas deposits recoverable from such land and land rights."

A. If that is the way it reads, I suppose I have read that, because I have read the classification.

* * * * * * * *

[fol. 2536] Q. Now, your proposed method does not comply with that at all, does it? A. I think it does.

* * * * * * * *

(Interposing) I have based it upon the exhaustion of the natural gas deposits recoverable.

Q. No, you have, for one thing, in there the depreciation upon your well equipment, have you not?

A. It is true that I have included for the recovery of investment in gas wells and for the recovery of investment in nonproducing leases, those items in my depletion account but I am not setting up a set of books. This is not a rule for the accounting department.

I am estimating what it is going to cost for certain purposes and I have done it in accordance with this Section 503.2 on Page 80.

Q. Now, the company has never accounted for depletion or for the depreciation of well equipment in this manner, has it? A. No.

Q. In other words, this would be an innovation?

A. That is not in the manner of any estimate.

Q. This would be an innovation in their accounting?

A. If they were to do it that way, that is correct.

[fol. 2537] Q. You were asked at the close of the session last night and this morning for a comparative statement of the depreciation and depletion which would be accrued, or rather amortization which would be accrued under your system as compared with what the company was doing.

It is correct, is it not, that you have omitted in the depreciation of plant the depreciation upon the well equip-

ment and had put it in what you term your depletion schedule?

A. That is correct.

Q. Now, your system attempts to look into the future and to provide for depletion upon the project for a period of 25 years, does it not? In other words, it is an average, isn't it, for a prospective period of 25 years?

A. No, sir, it is not.

Q. In other words, your depletion is not an average for that contemplated period?

A. No, sir, it is a depletion cost for the properties as they now exist.

Q. Do you mean that the depletion today is that amount?

A. I mean that the unit charge for depletion which I have estimated is that for the properties as they now exist.

Q. Well, then, you are depleting unproductive acreage, are you not?

A. I am accruing in a depletion reserve for the retirement of properties not now producing but estimated to have reserves.

[fol. 2538] Q. And you wish to charge off, then, as a present operating expense a reserve which will cover future operations which are, to a very considerable extent, speculative, is that right?

A. No, sir, I do not. I have set up a charge against present operations equal to the cost over the recovery of the reserves of land and leases and wells required to affect the recovery and set up that charge annually based upon the recovery during that year.

Q. But, in doing that, you necessarily enter into the realm of speculation as to how many wells must be drilled in the future and you apply a depletion to the cost of that operation which may or may not be necessary, do you not?

A. No, sir, I do not.

Q. In other words, you know today exactly how many wells must be drilled?

A. I do not, but I can make a rational estimate of the number of wells which will be required to be drilled.

Q. Do you know today how many wells are drilled?

A. Yes, sir.

Q. And you know how many acres those wells are draining, do you not?

A. No, sir, and neither does any other human being.

Q. All right, then you do not know how many wells you are going to drill, do you?

[fol. 2539] A. I can make a good estimate of how many wells will have to be drilled.

Q. You are starting out by determining depletion by injecting speculation. You must admit that.

A. I do not call it speculation. You can use any name you choose on it, but I make an estimate based upon information and knowledge.

Q. Well now, if that is true, then you have some knowledge as to the amount of drainage in the Hugoton Field in and about the present wells?

* * * * * * * *

The Witness: Well, I have a limited knowledge about drainage, yes, in the area.

* * * * * * * *

[fol. 2542] Q. You were speaking about the matter of your estimate as to the number of wells that would be necessary for the future recovery of this gas reserve, and you stated that you had some knowledge as to the matter of drainage in that field.

I observe on Page 4 of your Exhibit No. 67, that you have taken out of the Panhandle Field some 23,396 acres, they were in Sherman and Hansford counties, Texas, and placed them in the Hugoton Field: What was the reason for that?

A. Because, with the field outlined, as generally interpreted today, that acreage is part of the Hugoton pool rather than the Panhandle pool.

[fol. 2543] Q. In other words, the present concept is that the Hugoton Field extends through the Panhandle claim and into Sherman and Hansford counties, Texas, is it not? A. That is right.

Q. Now, theoretically, a few openings in one field would entirely exhaust the entire field, would it not?

A. Yes; in time.

Q. Now, then, the question of the amount of gas that could be produced from any one well would depend very much on the number of wells that were drilled in future in the areas surrounding it, would it not?

A. Yes, that would be one factor for that determination.

Q. You would have to, in some way, judge as to the amount of withdrawal from that field and the location in which those wells would be placed, would you not?

A. Yes, for the determination of the output of a particular well you would need to give that consideration.

Q. How many acres would one well drain in such a situation as you have in the field at the present time?

Mr. Culton: Which field?

Mr. Chamberlain: Hugoton.

The Witness: I don't know.

By Mr. Chamberlain:

Q. And do you have any way of computing how long it would take for a well to get to a point where it would not [fol. 2544] economically produce?

A. Yes, there are methods of doing that.

Q. How would you arrive at that?

A. I would compare the rate of changes in productive capacity with the cumulative withdrawals of as much of the well's history as was available. If there were no well history available, that matter could not be determined in such fashion; if the well history was too short, it might be misleading.

Q. Well, if a well had its pressure very much reduced by withdrawals, the reserve area, or whatever you call it, would again flow in, would it not? A. To some extent.

Q. It wouldn't do that except as there were wells outside beyond it which would exhaust the gas supply, would it? A. That is correct.

Q. Now, in estimating 25 years in the future, you must necessarily estimate as to how many wells may be placed in close proximity to the Panhandle wells, would you not?

A. No, not necessarily.

Q. You are able, then, Mr. Biddison, to sit here and tell us how many wells it is going to be necessary to drill within the next 25 years to obtain the reserve that is under this land?

A. I was able to [extimate] that on the basis of the regular procedure of development adopted by the Panhandle Eastern Pipe Line Company and that in general

[fol. 2545] use in the Hugoton area, that the well spacing would be one well per 640 acres; that there would be deviations from that because there are leases owned by Panhandle Eastern which are smaller than that, some of which will need to be drilled or surrendered.

* * * * * * * * *

[fol. 2549] Cross-Examination (Resumed)

By Mr. Littman.

* * * * * * * * *

[fol. 2550] Mr. Biddison, we will now discuss your amount to be deducted for depreciation on book cost of property as set forth in your Exhibit 69: Do you have that exhibit before you? A. Yes.

Q. Am I correct in stating that the conclusion that you reached from this exhibit is that the amount of $3,903,142.46, shown at the bottom of Page 2, Column D, headed, "Deduction for Depreciation," represents the amount which, in your opinion, should be deducted for depreciation from book costs of Panhandle Eastern Pipe Line Company and subsidiary company property as of June 30, 1941?

[fol. 2551] A. Before answering the question I want to call attention to the fact that you didn't quite correctly read the figure; the figure is $3,903,102.46.

Q. I thought that was the figure I had read.

A. That is my estimate of the amount of the cost of that property which has been lost through depreciation as of June 30, 1941.

Q. That is to say, if the book cost shown in column C in the total were to be used as the rate base in this proceeding, do I correctly understand that the amount of $3,903,102.46 should be deducted for depreciation, according to your testimony; is that correct?

A. That is not correct. If the amount, as per books, in column C, constitutes value, then there should be no deduction for any purpose that I know of.

Q. What is the purpose of setting forth the figures in column D, if your statement is correct?

A. The purpose is to show that if column C represents value originally, that $3,903,102.46, that value has been lost through depreciation.

Q. And should be deducted from the amount shown in column C to secure the value new, less depreciation?

A. No, sir, it doesn't represent value new less depreciation at this date. If column C be considered to represent values when the various items were constructed, then the [fol. 2552] amounts in column D represent the amounts of those values that have been lost. If column C represents value today, then column C, less column D, represents something less than value today.

. . . . . .

Q. Well, if you want to secure the book cost less depreciation for purposes of this proceeding, what would you do?

A. If you wanted to obtain book cost less depreciation for that purpose, use column E, which is book cost less depreciation.

. . . . . .

[fol. 2554] Q. You are not agreeing that book cost be used as a rate base?

A. No, sir, I am not.

Q. I think you make yourself rather clear in that regard. Now, what is the purpose of this Exhibit 69?

[fol. 2555] A. To show the amount of the cost of this property which has been lost through depreciation.

. . . . . .

Q. Expressed in terms of book cost?

A. Yes.

Q. Well, what is your purpose in submitting this exhibit if, as you say, it has no connection with a rate base, or determination of a rate base?

Mr. Culton: There is a further objection to that. The attorneys in this case accept the responsibility for causing exhibits on different subject-matters to be submitted for the purpose of providing information. We have attempted to expedite this matter by furnishing the types of information that have been considered in various types of rate cases. This information was requested by counsel of this witness, so these tabulations were prepared and questions asked about them, and by the other counsel also.

Trial Examiner: Read the question.

(The pending question, as above recorded, was read by the reporter.)

Mr. Wheat: Before the witness answers, let it be understood that counsel takes the responsibility for having this exhibit prepared. The exhibit, as everyone knows, shows depreciation. Counsel for the Commission asked the specific question, "What is the depreciation existing in the [fol. 2556] property in relation to its book cost?" In response to that request, we, counsel for the Panhandle Eastern, Respondents here, asked the witness to prepare this exhibit. If there is any further statement of the purpose required, we will be glad to answer it.

Mr. Littman: We have had a pretty good opportunity to get acquainted with Mr. Biddison for the past 3½ days, I think we will all be inclined to agree he wouldn't do something just because somebody else asked him to; he had some purpose in doing it, we may presume, and it is for him to say whether he did or did not have something to do with the origin of this idea of putting this exhibit in evidence. If it is of no significance, I would like to know that; if it is, I would likewise like to know what is claimed by this exhibit; I would like to know the facts.

Mr. Wheat: It is purely a question of law.

Trial Examiner: The purpose of the exhibit is perfectly clear and the witness is, of course, not responsible for any legal theories, or what not; let's get right down to the merits.

The Witness: If I may, I want to correct a misapprehension that might be gained by the last question put to me by Mr. Littman: I haven't said this has no relation to the matter of the rate case.

* * * * * * *

[fol. 2557] Q. Will you define the term "depreciation" as it is used in this exhibit?

A. It is the loss in value on property occasioned by wear and tear, the action of the elements and obsolescence, which may be definitely determined.

* * * * * * *

Q. Would you say that your estimate of depreciation to be deducted from book cost represents the loss in service value, not restored by current maintenance, incurred in connection with the consumption or prospective retirement in gas plant in course of service from causes which are known to be in current operation and against which the company is not protected by insurance?

A. Yes, it will conform with that definition.

Q. I believe you stated that, in your estimate for depreciation to be deducted, there is reflected wear and tear and the action of the elements and obsolescence?

A. Yes.

Q. Does it reflect decay?

A. Yes.

Q. Inadequacy?

A. Insofar as any could be determined, yes.

[fol. 2558] Q. Did you deduct anything for inadequacy at any place?

A. I think not.

Q. Does it reflect changes in the art?

A. It is designed to do so if there were any discernible which produced a lessening in value.

Q. Did you discern any?

A. I don't recall any.

Q. And that means, of course, you didn't deduct any for that reason?

. . . . . .

Q. Does your depreciation deduction include or reflect changes in demand and changes occasioned by action of the public authorities, and, if so, did you deduct anything for it?

A. It doesn't reflect that and I have no deduction.

Q. Does it reflect anything for the assumed exhaustion of the natural gas supply?

A. It does not.

Q. I believe you mentioned that it did reflect obsolescence. Did you make any deduction for any obsolescence?

A. I did not.

Q. Does your estimated deduction for depreciation reflect any depreciation other than that which be observed by the eye?

[fol. 2559] A. Yes. I wish to correct the previous answer that I did allow for obsolescence in equipment in the local

area around Kansas City; that is a small portion of the total property.

Q. Is that the only instance in which you made any deduction for depreciation which cannot be observed by the eye, namely, the one exception of the local area?

* * * * * * *

Mr. Littman: I think he made answer to that question and also referred back to the previous question, but I think the witness can straighten the matter out.

Mr. Gorman: Your answer to that question is properly interpreted as being "Yes," is it not?

The Witness: I don't think it should be any other way.

By Mr. Littman:

Q. I think I know what Mr. Biddison has in mind. Mr. Biddison, leaving out of consideration for the moment the local area, does your estimated deduction for depreciation [fol. 2560] reflect any depreciation other than that which can be observed by the eye?

A. Yes.

Q. Will you give us some examples of instances wherein you have made a deduction for depreciation that is not observable by the eye?

A. Well, I have made a deduction on gas wells in both the Texas Panhandle field and the Hugoton field; that is not observable by the eye. I have made a deduction on the main gas compressor units, each of the main line compressor stations; that is not discernible by the eye. Also on the auxiliary electrical unit in each of the compressor stations.

Q. Automobiles and trucks?

A. Yes, and on automobiles and trucks, and on the main transmission line. The depreciation which I have allowed is not that which would be determined simply by the observations on test holes which were dug, but as a result of the application of those observations, together with the data made available in regular reports of inspection of pipe by the Panhandle Eastern Pipe Line Company, weighed out as to the length to which the data should properly apply.

Q. Mr. Biddison, perhaps you misunderstood my question. My question was, Does your estimated deduction for

depreciation reflect any depreciation other than that which can be observed by the eye? Now, with respect to the main transmission line that you mentioned, do I correctly under- [fol. 2561] stand you to mean that you used the observations and data of others as well as your own observation?

A. That is correct.

Q. But that was primarily for the purpose of ascertaining what the observation would have been if you had had a chance to see all of those particular test holes?

A. That is correct.

Q. Well, then, if we understand each other, and I think we do, with the exception of the items that you have named, other than transmission mains, you used the pure observation method and reflected in your estimated deduction for depreciation that depreciation only which could be observed by the eye? Now, am I correct in my statement? If you want to state it in your own language, it is perfectly all right for you to do it that way. I just want to know how much of your estimate represents the pure observation method, and what part of it does not.

. . . . . .

I think that is substantially correct, yes. There might be some minor variations from that, but I don't recall right now. The particular ones would be in the local area of wells and pipe lines which are a small fraction of the total.

Q. Yes, and Mr. Gorman calls my attention now to the [fol. 2562] matter of wells. You used the observation method on wells, or did you not?

A. I did not.

Q. Well, we will come to them, that specific item, later on, anyway, where we can discuss it more fully. I wanted at this point to get a general statement of your method. We agree that principally it was the observation method?

A. Principally so, yes.

Q. Now, you have from time to time in your direct examination referred to percentages in expressing your estimated deductions for depreciation. What does the term "100 percent condition" mean as you have used it?

A. It means as good as new; it has lost none of its original value; that it hasn't been damaged.

Q. The day a piece of equipment is first installed brand new it is in 100 percent condition, is it not?

A. Not always, but that is generally true; they may damage it in installing it.

Q. But excluding such damage you would agree it would be in 100 percent condition on the day it is first installed?

A. Yes.

Q. After it is used three years would it still be in 100 percent condition?

A. It depends on whether it had deteriorated or been damaged.

[fol. 2563] Q. You, then, can readily conceive of cases where property that is three years old would still be in 100 percent condition?

A. Certainly.

Q. Even though it is three years closer to the day when it would be retired?

A. Yes.

Q. Well, what does "zero percent condition" mean?

A. It means that all value has been lost.

Q. It does not represent the status at which the property is to be retired?

A. Not necessarily; quite often property is retired before it becomes zero percent condition.

Q. You say quite often; will you elaborate a little on that and give us some examples of that situation?

A. It is quite common in the operation of gas pipe lines that because some pipe needs to be removed that more pipe is removed at that time than that particular length which compelled removal. It may be economical, while the ditch is open and while the crew is there, to remove a considerable amount of additional line, not because it is necessary at that time to remove it, but because it is economical to do so. Some of this additional pipe may be a long ways from zero condition; it may have considerable value and considerable service life left. Furthermore, [fol. 2564] during changes in pipe line location of grade, it quite frequently happens that pipe is removed and abandoned without any reference to its physical condition. It is also true that there is a considerable amount of equipment subject to very little wear, subject to the action of the elements, which loses very little value up until the time some accident may damage or ruin it. It is also true of other equipment that it may remain in excellent shape

with very little loss in value up until the time somebody devises a better and more efficient piece of property to do the same work, at which time this equipment may suddenly lose value.

Q. You haven't deducted anything for the causes of retirement which you have just described, have you?

A. I have not deducted anything for causes which may in the future cause loss in value; I have attempted only to make deductions for those things which have caused loss in value.

Q. You made an allowance on the annual side, however, for those causes which you just described, have you not?

A. I have made an allowance for an accrual for those things which will happen in the future. The accrual is to take care of the present and future. I have made no allowance in the present condition of this plant for an amount to be deducted for depreciation which has occurred for items which have not occurred.

[fol. 2565] Q. And you have made such an annual allowance because, as you have heretofore testified, you know that they are going to happen?

A. That is correct, but they don't cause loss in value until they happen.

Q. Well, let's take the first example that you named: I believe you said that oftentimes pipe is taken up before it reaches zero percentage condition, and you gave an example of where there was a stretch of pipe that has to be retired by reason of deterioration and it was found economical to remove the pipe alongside of the deteriorated pipe as an economy. Have I correctly portrayed your thought in that connection?

A. Yes.

Q. Let's take that example: If at one of your inspection points you observed such a piece of pipe which had not yet reached such zero percentage condition, as you have described it, you would be very likely to record a percent condition of something as high as, say, 60 or 70 percent, might you not?

A. That is possible.

Q. In fact, it has happened in your long experience, has it not?

A. I expect so.

[fol. 2566] Q. What does 98 percent condition mean?

A. To me it means that 2 percent of the value has been lost.

Q. Does it mean that 2 percent of the service value has been lost?

A. Two percent of its value for any purpose has been lost; it doesn't mean that 2 percent of its life has expired; it means that 2 percent of its value has expired.

Q. Don't anticipate me too much, Mr. Biddison. Could you answer the direct question as to whether 98 percent condition means that 2 percent of its service value has been lost?

A. Yes.

Q. I believe that was the term that was used in the definition I read to you. But you don't consider, as you just stated, service value to relate to service life?

A. Yes, it is related.

Q. Well, you say it has a relationship: how much of a relationship do your percents have to life, service life?

A. I can tie them up to service life in some cases; in some cases I cannot. In the case of these main compressor units I have assigned service lives not in terms of years during which they might be kept in position, but in terms of operating hours that they might be operated.

Q. Well, that was one of the exceptional cases, was it not, Mr. Biddison?

[fol. 2567] A. That is right.

Q. There you did relate your percent condition directly to service life in terms of hours?

A. That is right.

Q. But that, as we agree, was an exception rather than the rule?

A. No.

Q. You didn't do it that way for the pipe?

A. No.

Q. That is, you didn't determine the life of the pipe and try to relate your percent to that?

A. That is right because I don't think the pipe is consumed in service in any such fashion; I think that gas compressors are.

Mr. Goodman: Could I inject at this point just to ask one question?

Mr. Littman: Yes, certainly.

By Mr. Goodman:

Q. Could you tell me what a piece of pipe in the main transmission system which is marked or graded or valued by you at 98 percent condition, will fail to do in comparison with a pipe in 100 percent condition?

A. Yes, I can tell you.

Q. Well, what do you say?

A. It won't fail to do anything that the pipe in 100 [fol. 2568] percent condition will do.

Q. Now, if you will turn to Exhibit 69, Mr. Biddison, I call your attention to line 8, on page 1, entitled "Leaseholds," which have a book cost, as shown in column C, of $1,745,207.39, and which, as shown in column E, have a book cost, less depreciation, of exactly the same amount. Obviously, you made no deduction for depreciation on account of leaseholds, did you?

A. That is right.

Q. Is it your testimony that there has been no depreciation on these leaseholds since they were acquired by the company at the book cost shown in column C?

A. Yes, and on the other hand I think there has been a very great appreciation in these leaseholds since their acquisition.

Q. Mr. Biddison, I am now talking about physical depreciation from book cost. Now, what would be your answer?

A. There has been no physical depreciation in leaseholds.

Q. Did the leases cost the company any more than $1,745,207.39?

A. All I can tell you about that is that that is the cost as furnished to me, as given from the books.

Q. Do you know how much gas has been withdrawn from those leaseholds since they were first acquired by the [fol. 2569] company at the cost shown in column C?

A. I think I can determine that figure.

Q. I think your Exhibit 67, page 5, might show that. Have you found the figures?

A. I think so; as I add it up it is 159,873,106 m. c. f.

Q. That is the amount of gas that has been withdrawn from those leases since they were acquired by the company at the cost shown by the figures in column C?

A. That is right.

Q. Doesn't Exhibit 67, page 5, show that the gas reserves of the company in the field are approximately 20 percent depleted?

A. It shows that a little less than 20 ~~percent~~ of that which is ultimately expected to be produced has been produced.

Q. And that is what is commonly called depletion, is it not?

A. No, that is past production.

Q. What do you call your allowance, your unit allowance, for that past production? I think it is in a heading of this Exhibit 69, is it not, "Unit Charge for Depletion"?

A. I have a depletion unit charge set up on page 2 of Exhibit 67.

Q. Now, these leases have suffered depletion, then, since they were acquired by the Panhandle Eastern Pipe Line Company at the cost, per book, shown in column C, [fol. 2570] have they not?

A. Yes.

Q. And you made no deduction whatever for depletion?

A. That is correct.

Q. Why?

A. Because in Exhibit 69 I was showing the amount by which the property had suffered depreciation.

. . . . . .

Q. Mr. Biddison, can't you get away from reproduction cost for a moment and talk about book cost? Should there be a deduction made for the depletion which you yourself have admitted has come about from that book cost?

A. Not for any purpose that I know of.

Q. Well, of course, you don't propose that this exhibit be used for any purpose?

A. It is not my function to determine what they will be used for.

. . . . . .

[fol. 2574] By Mr. Littman:

[fol. 2575] Q. Is the figure shown in Column C entitled "As Per Books" in the sum of $1,745,000 useful for any purpose in this proceeding?

A. I think it may well be. It is my understanding that the matters of cost and value are matters to be considered in a proceeding of this sort.

Q. Now, Mr. Biddison, you have used that figure, as a matter of fact, haven't you?

A. Yes.

Q. For what purpose?

A. To show the cost of those leases.

Q. For what other purpose or have you forgotten?

A. I used it in Exhibit No. 67.

Q. You surely did. For what purpose?

A. To determine the unit charge for depletion.

Q. Of leaseholds?

A. Of leaseholds, for leaseholds and wells.

Q. And so your annual allowances for depletion of leaseholds uses, as a base for that depletion, the book cost which you show in Column C, in the amount of $1,745,000, is that not correct?

. . . . . .

[fol. 2577] Q. Now, what is the purpose of a unit depletion allowance based on book cost of leaseholds, Mr. Biddison?

A. To recover, by proportional charges applied to the production, the amount of the cost by the time the production is completed.

Q. That is, to return the investment in leaseholds to the company as they are depleted?

A. That is correct.

[fol. 2578] Q. Now, you would not want to suggest, would you, Mr. Biddison, that the company receive or recoup its investment in these leases and, at the same time, earn a return upon the undepreciated, undepleted original investment in those leases?

A. I would certainly suggest that that would be the minimum to which this company should be subjected.

. . . . . .

[fol. 2580] By Mr. Littman:

Q. Now, assuming, Mr. Biddison, that we are down in 1964 with only one more year to go according to your estimate of the end of the life of this property and assuming that you had been collecting, as you suggest, I mean the

company had been collecting, as you suggest, $136,614 a year on the average for depletion which, of course, includes depletion on leases.

Let us assume at that time the book cost of the leaseholds still stands on the books at $1,745,000. Would you still suggest that there be no deduction from the book cost figure for depletion?

A. You mean, there would be no deduction for depletion from the book cost of leases, is that the proper [fol. 2581] interpretation of your question?

Q. Depletion or depreciation, there would be nothing in this Column D?

A. Yes, sir.

Q. Yes, there should be a deduction then?

A. No.

Q. Or yes, there should not be a deduction?

A. There should be no deduction.

Q. Notwithstanding the fact that the company will have been recovering and recouping its investment in these leases through all those years at the rate of $136,000 a year down to 1964?

A. Yes, sir, by virtue of the fact that they are in there at their cost and not in there at their value.

Q. They should earn a return on the original book cost or something higher, notwithstanding the facts that I have assumed?

A. Yes, sir.

Q. Now, let us look at the item of rights-of-way for transmission system properties in Exhibit 69, Page 1, Line 27.

I note that the cost per books for that item is $1,181,039.97 and you have deducted nothing for depreciation. Is that correct?

A. That is correct.

Q. Why?

[fol. 2582] A. Because I do not think they have depreciated. I do not think they have lost value.

Q. Don't rights-of-way lose value?

A. They lose value suddenly when they are abandoned. Up until that time, if you are justified in operating the property thereon, they have not lost value.

Q. Something like the "One Hoss Shay," it collapses on the last day of its life, is that right?

A. It might be more like a house which burns down and loses value suddenly. As long as that burning down has not happened, the loss has not occurred.

Q. Well, how about the pipe that runs over those rights-of-way? Does that all accumulate depreciation like a house that burns?

A. No, sir, it does not.

Q. On the last day?

A. It does not.

Q. But the rights-of-way do?

A. Substantially so, yes.

Q. I am sorry, I do not get the distinction. Would you mind telling me why the one does and the other does not?

A. Well, we will take this example:

If I laid a pipe line ten years ago that was going to run for 30 years, it would still have 20 years of life today. The right-of-way for that line might have cost me $1,000,000. I [fol. 2583] would have 30 years over which to amortize it. I think today that right-of-way is worth $1,000,000.

That is, it has not lost its value because, if I had not built that pipe line ten years ago, I would put it in today even though I only had 20 years future life for it and I think the value of the one right-of-way today would be precisely that of the other one, that there would have been no loss in value of the first piece of right-of-way.

Mr. Lee: May I ask a question?

Then it is your idea that the duration of the term for the use of the right-of-way does not affect its value?

The Witness: That is right. It does affect the rate at which you must accrue funds by which to effect the retirement.

Mr. Lee: You would say that an easement for this purpose that has 20 years to go is just as valuable as the easement that has 30 years to go?

The Witness: Yes.

By Mr. Littman:

Q. If you had two rights-of-way, Mr. Biddison, one that had 20 years to run and one that had only one yar to run, assuming all other things to be equal, which one would be worth the more?

A. The longer-termed one would be the more valuable if you had a requirement for the longer term.

Q. I said all things being equal. The longer one would [fol. 2584] be worth more than the shorter one?

A. If you had a requirement for the longer term, but if you hadn't, one would not be more valuable than the other.

Q. Yes. Looking at the annual allowance side, you have made an annual allowance for the replacements of these rights-of-way, have you not, in your Exhibit 68?

A. Yes.

Q. In the amount, I believe, as shown in Line 15 of that exhibit, of $1,181.04 per year?

A. That is right.

Q. And you have proposed that substantially that amount would represent the proper amount from the beginning down to June 30, 1941?

A. No.

Q. You would have to calculate to tell exactly what it would be, but you would at least apply the rate of .1 per cent to compute on the right-of-way for an annual allowance for replacements?

A. That is correct.

Q. That would amount to a sizeable sum of money, would it not?

A. Yes, it would.

Q. But you will have collected that, that is, the company will have collected that under your theory for ten years and yet you make no adjustment for depreciation? [fol. 2585] A. That is right.

Q. Will you please turn now to the item of gas wells shown in Line 9, in the book amount of $2,620,290.94 for which you make a deduction for depreciation of $216,232.61, leaving a "book cost less depreciation" shown in Column E of $2,404,058.33?

What method was used to arrive at the deduction for depreciation for that account?

A. In most cases, I have deducted one percent per year of age but, in those cases where specific deterioration was determinable by examination of records, I have made additional allowances beyond the allowance of one percent per year of age.

Q. How many wells were depreciated by you on the so-called life method of one percent per year that you just described?

May I ask, were those wells in the Local Area?

A. Exclusive of Local Area wells, I have depreciated 114 wells on the basis of age and I have depreciated 23 wells on the basis of factors other than age factors [producting] a lower condition than the age figure would prodnce.

Q. Now, the age method that you described was to take a straight flat one percent per year, is that right?

A. That is right.

Q. That would indicate a life, on the average, of 100 [fol. 2586] years for each well, would it)not?

A. No, sir, it would not.

Q. Would it indicate a physical life of 100 years?

A. No, sir, it would not.

Q. The 23 wells that you based on factors other than age were depreciated how? Describe your method, generally.

A. In the Hugoton Field, the Gregory No. 1-19 needs the setting of an additional string of casing. The original producing string appears to have been perforated by corrosion. I have, therefore, deducted 25 percent of the cost of this well.

Q. How did you arrive at 25 percent?

A. That is a judgment figure as to the amount of value that has been lost by virtue of the fact that there is some leakage in the casing.

Q. Did you observe that well?

A. No, I got this information from data on file in the Production Department of Panhandle Eastern Pipe Line Company.

Q. In other words, the casing represents approximately 25 percent of the entire cost of the well and you, therefore, deducted 25 percent from new to get your percent condition?

A. No, I estimate that by virtue of the fact that the casing has been perforated at some point, that the well has lost 25 percent of its value.

Q. I see. Will you proceed to explain your method [fol. 2587] please?

A. The Youngren No. 1-24 in the same field shows indications of caving conditions and it is estimated that it will probably have to be reworked.

It is also stated there is probably some material in this hole, some junk material left there at the time of drilling or at the time of cleaning out.

Q. What percent condition did you place on that well?

A. I deducted 25 percent on that well for that condition.

Q. Did you see that well? A. Yes, sir.

Q. How much of the well did you see?

A. I saw that portion of it which is above ground.

Q. And that portion of it which is above ground represents what portion of the total cost of the well, approximately, in percentage?

Something like five percent, would you say?

A. Close to that.

Q. How long did you spend at that well?

A. Three or four minutes.

Q. And what did you do during that three or four minutes, Mr. Biddison?

A. Just looked at the well.

Q. Did you take a picture of it?

A. I believe I did.

[fol. 2588] Q. How much of the three or four minutes was spent in taking the picture?

A. Probably thirty seconds.

Q. All right. Will you proceed with the next one?

A. Crawford No. 1-31, on this well which is proposed to be acidized, it appears that the cementing of the casing was not as good a job as is required preliminary to acidization and it is proposed to re-cement this casing before acidization and for that well I deducted 15 percent.

Q. How did you arrive at the 15 percent, Mr. Biddison?

A. That is my estimate of the value lost by that well by the failure of the cement job to last.

In this same field, the Gaskell No. 1-100 is in the same condition as for the Crawford well just referred to, and for it I have also deducted 15 percent.

Q. A judgment estimate? A. Yes, sir.

Q. Did you see that well?

A. I do not recall. I would have to run through my field notes to determine that.

Q. Now, you have cited several examples. Is that representative of the method and manner in which you determined the percent conditions on the 23 wells that were based upon a determination other than the basis of age?

A. That is correct. I endeavored to give effect to the [fol. 2589] information that was available as to conditions of these wells which detracted from their value even though you could not see it by observation.

Q. Now, that is a total of 137 wells that you determined a percent condition for.

How many of those wells did you observe?

A. I will have to make a count on that before I could tell you. I have to count from my field notes.

Q. Can you give us a general idea, Mr. Biddison? We would not hold you to an exact figure.

A. Well, in the Panhandle Field, I judge I saw 15 or 20 wells.

In the Hugoton Field, about half-a-dozen. That is as near as I can make a guess at it right now.

Q. Yes. When I used the term "saw", I do not mean driving by in a car, you understand. I mean, a detailed observation, what you would call an inspection.

A. Yes.

Q. How many did you actually inspect?

A. Well, I think probably in the Panhandle Field 15 or 20 and maybe something like a half-a-dozen in the Hugoton Field. That is as near as I can give it to you from memory.

Q. That is around 30 out of the 137, roughly?

A. Say around 25, roughly.

Q. And you spent three or four minutes at each?

[fol. 2590] A. Yes.

Q. And you took a picture of each one, did you not?

A. No, I did not take a picture of each one.

Q. About how many of those that you observed did you take a picture of?

A. I probably took pictures of half of what I looked at.

Q. What is the basis of your one percent deduction per year for depreciation on the 114 wells?

A. It is an allowance to take care of the known fact that these wells would depreciate. That depreciation accelerates with age and, in comparatively young wells, the amount of depreciation is hardly detectable and cannot be determined in any event, by purely surface inspection.

Q. Now, will you name the factors or causes that bring about the retirement of a well? First, name the most important one.

A. Depletion, depletion of reserves.

Q. That is correct, the exhaustion of the gas. Why didn't you use that as the basis of determining the depreciation on the wells, bearing in mind, Mr. Biddison, that you used that basis for the determination of your annual allowance for depletion?

A. Because that does not fix the amount by which a well has depreciated. If you were justified in drilling a [fol. 2594] well upon a tract of land, the value of that well is not reduced just the minute you drill it in by virtue of the fact that 25 percent of the total reserve of that tract had been withdrawn before you drilled the well.

Q. Now, are you talking about the well without gas in it or are you talking about the well and the gas together.

A. I am talking about the well and the effect of previous withdrawals upon that well.

Q. Who is going to buy a well without any gas in it, Mr. Biddison?

A. I have not suggested that anybody would.

Q. Well, in the hypothetical case that you are giving us, I understood you to say it was a well without gas.

A. No, sir, I did not say any such thing as that.

Q. Your valuation, the valuation you are speaking of is the value of the well without the gas, isn't it?

A. It is the value of the well.

Q. Without the gas?

A. I am not including the value of the gas in the value of the well. I am speaking of the value of the well.

Q. Without the gas?

A. The gas is not part of the well.

Q. Can't you answer me yes or no?

A. I will answer any questions susceptible of being answered that way.

[fol. 2592] Q. Are you talking about the value of the well without the gas in it now, separate and apart from the gas?

A. I am talking about the value of the well separate and apart from the value of the gas, but I am not talking about a well that would not produce gas and that does not have gas at its location.

* * * * * * * *

[fol. 2597] P. McDonald Biddison having been previously sworn, resumed the stand and testified further as follows:

* * * * * * * *

Cross-Examination (Continued)

By Mr. Littman:

[fol. 2598] Q. Mr. Biddison, at the close of yesterday's session, we were discussing Exhibit 69, which shows the amount deducted by you from book cost for depreciation to determine the amounts which are shown in Column E to be the "book cost less depreciation" and we were discussing particularly the well account shown in Line 9 of that exhibit.

I believe you testified near the close of yesterday's session that the major cause for the retirement of gas wells is exhaustion of the gas supply.

Is that correct?

A. Yes, sir.

Q. And I believe you were going to enumerate other causes that brought about the retirement of gas wells and we had not completed that line of inquiry.

Did you want to state what other causes there are, if any?

A. Wells may sometimes be retired because of peculiar conditions arising in the producing sand, such as caving of the hole, water intrusion, salting up of the producing sands and wells may also be abandoned because of failure of casing.

There are rare instances when a well may need to be abandoned because of blow-outs around the casing.

Q. Those items which you have just named, of course, effect, do they not, the ability of the well to produce gas?

A. Yes.

. . . . . .

[fol. 2601] Q. Mr. Biddison, do you know of any instance in which any of Panhandle Eastern's wells have been retired by reason of cave-in, watering up, salting or failure of casing, which, I believe, summarizes the reasons you just made?

A. No, I do not.

Q. In some of those instances, at least, cannot the well be repaired for future use after a cave-in or a failure of casing or after some of the other things occur which you named?

[fol. 2602] A. Yes, quite often, and I have called attention to some instances where rehabilitation was in immediate contemplation with respect to some of those wells but, on the other hand, they are matters that do cause the abandonment of gas wells.

Whether the wells can be reworked and put in good condition depends upon the extent and locality of the damage that is done.

Q. You mean, sometimes they can be rehabilitated after these events occur and sometimes they cannot?

A. That is right.

Q. Generally, may we not agree that the predominant cause of retirement of wells is the exhaustion of the gas supply?

A. That is right.

Q. And you did not use the depletion of the gas supply as a basis of measuring the depreciation of the wells, did you?

A. No, sir, I did not. I used the depletion method to set up the accruals for ultimate retirement.

Q. That is, the annual allowances for accruals?

A. Yes, sir, but I did not use depletion in order to determine the amount of value which the wells had lost at this

time because the value which they have lost at this time is not a function of depletion.

Q. In your opinion, of course?

[fol. 2603] A. Yes, sir, in my opinion and in the opinion of a great many others.

* * * * * * * *

[fol. 2608] By Mr. Littman: And did you make a determination of the amount to be deducted for depreciation for 80 wells in the Hugoton Field?

A. Yes.

Q. Very well.

A. I think I should explain that a little bit.

Q. Proceed.

A. I made a calculation of the amount to be deducted for depreciation on each well based upon its reproduction cost and thereby determined a figure to be deducted for depreciation for the wells in the Panhandle Field and a separate figure for the wells in the Hugoton Field.

Q. And you used the same percentage for deduction of depreciation for purposes of Exhibit No. 69 applied to book cost, did you not?

A. That is true, but I do not believe I separated that by fields in making that application to the book cost figures.

Q. I see. Well, let's talk now about the 80 wells in the Hugoton Field, Mr. Biddison.

Now, with the exception of four wells which I believe [fol. 2609] you described yesterday, the balance of the wells, namely, 76, were depreciated by you how?

A. One percent for each year of age.

Q. That is to say, you had before you the date of the completion of each of these 76 wells in the Hugoton Field and you simply deducted one percent per year of age for each well, did you not?

A. Yes, sir.

Q. In other words, if I correctly understand you, if a well was drilled in 1939, you simply deducted 2 percent for depreciation for that well?

A. That is right.

Q. Now, how did you arrive at that one percent figure?

A. That is a matter of judgment.

Q. Can you elaborate for us on that method, Mr. Biddison?

Let me get at it this way: Did you have any working papers that showed the process whereby the one percent per year was reached?

A. No, sir, that is a primary figure. That is the beginning point. I used one percent not because I believed that each well in that field has lost value to the extent of one percent per year of age. Many of those wells will have lost value at less than that rate; some of them have lost value at more than that rate, but, upon the average, a group [fol. 2610] of wells will, in my opinion, lose value on the average at about one percent per year for a considerable period of time.

It may well be that that rate will be accelerated at later dates, particularly if, at later dates, there be an appreciable amount of water encroachment.

Q. Did you base the one percent judgment figure per year upon any experience of Panhandle Eastern in the Hugoton Field?

A. No, sir.

Q. Or in the Panhandle Field, Texas Panhandle Field?

A. No, sir. There is no record of experience in those wells by which such a matter could be determined or even investigated.

Q. Did you determine that one percent figure from any other experience?

A. That is a matter of my own general experience in the handling of gas producing properties.

Q. In other gas fields?

A. Yes, sir.

Q. Not in these gas fields in which Panhandle Eastern operates, however?

A. Not as a manager myself of producing properties, no, but I have had access to information on other peoples' records as to what happened to some of their gas wells.

Q. Are you talking now about the Panhandle Field and [fol. 2611] the Hugoton Field?

A. I am talking particularly about the Panhandle Field.

Q. What does that experience show?

A. That experience showed that, with a few exceptions, wells showed no signs of any physical depreciation for long terms, 15 years or more.

Q. That is to say, if you looked at those wells, you could not observe any material physical depreciation, is that what you mean?

A. That is partly it.

Q. What is the rest of it?

A. And there were no indications manifested by the operating characteristics that indicated anything in the way of deterioration.

Q. Now, you did not observe any part of the wells owned by Panhandle Eastern that was below the surface of the ground, did you?

A. No, I previously acknowledged that.

Q. Nor of any other wells in the Panhandle Field?

A. No, I have never been below ground on any of those wells.

Q. Then what did you observe in those wells that caused you to come to the conclusion that you state you just reached with respect to your claim that there was no physical depreciation that you could observe? What do you mean by that?

[fol. 2612] A. I mean, as I said, that the records of their operations showed no indications of any deterioration.

Q. In other words, the records showed that they were still able to efficiently produce gas?

A. That is right. There was nothing in the operating records which indicated that anything had gone wrong.

Q. This one percent figure is kind of a loose estimate, is it not, Mr. Biddison?

A. I think that would be a matter of opinion. I think it is a good estimate.

Q. Is it one of those round and flat figures that you referred to the other day as being a judgment figure?

A. No, it is just a straight up and down one.

Q. Now, any school boy starting out with the premise of one for each year could have taken these 76 out of the 80 wells in the Panhandle Field and computed the amount of depreciation on that basis, couldn't he, Mr. Biddison, by just taking one percent for each year?

A. Certainly, that is really a matter of arithmetic.

Q. It was not much of a trick to do that?

A. No.

Q. Now, as to the remaining four wells, you varied the procedure somewhat, did you not?

A. Yes, sir.

Q. And that was, I believe, because you had received [fol. 2613] some information from the Production Department to the effect that something was wrong with those four wells as you described yesterday?

A. Yes, sir.

Q. Mr. Biddison, will you refresh my recollection whether you covered the four wells in the Hugoton Field yesterday?

A. I believe I did.

Q. Suppose we go back to one of them again. Let's take the Crawford No. 1-31-5464C. I believe that well is shown on Page 3 of Schedule 4 of Exhibit 17, Line 15.

Will you state what caused you to vary the procedure on that well?

A. The information I have is that this well is to be acidized, that the cementing of the casing is in such a condition that re-cementing is required before it can be acidized.

Q. When was that well installed or completed?

A. I do not believe I have a list here that gives the completion date on that well.

Q. Do you have the date of completion on the other three wells that you described yesterday for which you used a different method than the one percent per year method?

A. No, sir, I do not. I have such a list in my papers some place, but I do not have it with me.

Q. Now, going back to the Texas Panhandle Field, there are 55 wells in the Panhandle Field.

[fol. 2614] Mr. Culton: Just to clarify the record, do you know if that Crawford well is a partnership well or 100 percent well, Mr. Biddison?

The Witness: That Crawford well is a partnership well, 50 percent ownership in Panhandle Eastern.

By Mr. Littman:

Q. Now, there are 55 wells in the Panhandle Field upon which you made a determination of percent condition, are there not?

A. That is right.

Q. Thirty-six of which were determined by the straight one percent a year deduction method, is that correct?

A. Yes, sir.

Q. And 19 of which were by a somewhat different method which we will soon have you describe. Now, you have the dates of those wells, haven't you, before you?

A. Yes, sir, I do.

Q. Suppose we go to one of the 19 wells in the Panhandle Field on which you varied the usual procedure. Let's take the Sneed well No. 1025A and it also has the number 1-33 opposite it. When was that well first installed?

A. The completion date on that was 7-15-1931.

Q. What percentage did you deduct for depreciation of that well?

A. Fifteen percent.

[fol. 2615] Q. That is 5 percent more than would be indicated by the application of one percent for each of the ten years of its expired life?

A. That is correct.

Q. Now, will you tell us how you went about getting that 15 percent depreciation on that one?

A. The data on that well shows a poor job of cementing with water leaking in the well as the result. That is not depreciation. That is just bad construction.

This well also needs a new master gate, that is, the master gate that is on there needs to be retired and a new one put on.

Q. Isn't that the well that requires frequent blowing to keep flowing?

A. If it has some water leaking in it, frequent blowing might be required. I do not have any note to that effect.

Let me get straight on this, maybe I am reading the wrong well.

Q. This well is shown on Line 30 of Page 7 of Schedule 4 of Exhibit 17.

Mr. Culton: The Sneed well in Section 33 is what it is.

The Witness: The Sneed 1-33 well No. 1025A, requires frequent blowing to keep it flowing and, on that well, my deduction for depreciation is 15 percent.

By Mr. Littman:

Q. May I clear up this part of the record, Mr. Biddison. [fol. 2616] Your previous answer with respect to that well was in error, was it not?

A. Yes, the data which I gave applies to a different Sneed well.

Mr. Culton: What was the completion date on this well, if you have that figure before you?

The Witness: 7-15-1931.

Mr. Culton: You had the correct completion date, then?

The Witness: Yes, sir.

By Mr. Littman:

Q. Now, you may proceed with your explanation as to how you arrived at the 15 percent. The well was 10 years old?

A. It is my estimate that a well in that condition has lost 15 percent of its value. The situation can be remedied by additional investment, as will be needed to be done in most of the wells in this territory in any event, by the installation of a syphon.

Q. Well now, if that condition which you described which requires frequent blowing to keep flowing were not present, you would have placed a percent depreciation on that well of 10 percent, would you not?

A. That is right.

Q. You merely added another 4 percent depreciation by reason of the condition which you described?

A. Five percent, 5 percent is right.

[fol. 2617] Q. I beg your pardon, 5 percent.

Now, how did you arrive at that figure of 5 percent, Mr. Biddison?

A. That is my judgment of the amount of value that is lost by reason of that condition.

Q. Do you know how much money would be required to be spent to put that well back into 10 percent depreciation or 90 percent condition?

A. I do not know whether any amount of money would do that or not.

Q. Did you inquire of the production department how much money they expected to expend to remedy the condition which you describe?

A. No, I did not inquire as to the amount of money that would be required to remedy the situation. I estimated the amount of value that had been lost by virtue of the situation.

Q. How could you determine that this well should be depreciated 5 per cent below what it ordinarily would be depreciated at without making some investigation of the amount of expenditure that would be required to repair this condition which you describe?

A. I did not make any such determination. I determined that, in my judgment, this well had lost 15 percent of its value by virtue of the condition it was in.

I did not add 5 percent to 10 percent. I deducted 15 [fol. 2618] percent from the value of this well on account of the condition it was in.

Q. Mr. Biddison, if it did not have this condition which you describe, you would have put this well in 90 percent condition, would you not?

A. I would have deducted 10 percent.

Q. Well then, didn't you just add another 5 percent by reason of the condition which you found?

A. No, sir, I did not. I deducted a total of 15 percent for this particular well on account of the condition it was in.

Q. Did you have any further information about this well other than that you were told that it required blowing to keep flowing?

A. Yes, I had information that that condition would eventually be remedied by the installation of a syphon as is contemplated for practically all wells in both the Hugoton and Panhandle field.

* * * * * * * *

[fol. 2619] Q. Well, let's have a look at the Thompson well No. 1-25-1041A in the Texas Panhandle Field which is shown on Page 8 of Schedule 4 of Exhibit 17 at Line 37.

A. The information is that the Thompson well makes a little moisture.

Q. Did you have any other information on that well?

A. No, that is the sum total of my notes.

Q. Now, Mr. Biddison, when was that well completed?

A. December 17, 1937.

Q. Will you look again, isn't that 1938?

A. My data show 1937.

Q. All right. Now, if you had not been advised that this well "makes a little moisture", how much would you have deducted for depreciation for that well?

A. Four percent.

Q. How did you arrive at the deduction of 15 percent?

A. That is my judgment that, because of this water condition, the well has lost some value and I estimate that loss to be 15 percent.

Q. With no other information than the notation to the effect that it makes a little moisture?

A. Yes. If there had been information available that this moisture was caused by faulty cementing, by the failure of the cementing or by the leakage of casing or some [fol. 2620] such factor as that, if there had been such information, I would have made a notation of it and would likely have had a different deduction for depreciation.

Q. Now, did you make any determination of how much would be required to be spent to put this well back in 96 percent condition?

A. No, I do not think anybody could make any such estimate as that.

Q. You have no idea of what would be required on this particular well to make the repair?

A. I do not think it can be done by repairs. I do not suppose it would be physically possible to ever put this well back in condition where this did not exist.

Q. What might cause this moisture condition?

A. Condensation of moisture out of the gas as it flows from the producing sand into the well bore.

Q. Well, I am referring now to what condition in a well might cause this to occur? Is it a condition that is inherent in the sand or is it caused by some difficulty in the well itself?

A. It may be caused by peculiar sand conditions at the proximity of the well bore. If the sand conditions be such that there be a material throttling of the gas close to the well bore, there is a refrigerating effect produced which tends to produce condensation in the well bore.

[fol. 2621] These conditions may exist in a well upon drilling in and they may develop at a later period. It is also true that water can come into a well through a bad job of cementing or through perforated casing.

Q. And you did not know what was the cause of this moisture condition, did you?

A. My notes were compiled on the basis of accounting for defects in the wells, if any were known to exist, which would cause any of these features.

I know, from my notes, of no defect in the casing or cementing job that would cause this.

Q. Some of those causes you mentioned do not have anything to do with the depreciation of a well, do they, Mr. Biddison?

A. Yes, if the cementing job goes bad, that is depreciation. If the casing corrodes and leaks, that is depreciation.

Q. What of the sand condition which you described?

A. I would say if the hole caves, that that depreciates the well. If bottom hole water were to come in, I would say that would depreciate the well. If the sand salts up so as to produce a throttling near the well bore with a resulting refrigerating action that causes precipitation of moisture in the well bore, I think that depreciates the well.

[fol. 2622] Q. Are there any conditions that might cause this moisture that do not have anything to do with depreciation of a well which you can think of? A. Yes.

Q. Name us a few of those, please?

A. It might have existed from the beginning, in which case it has not produced depreciation.

Q. So far as you know, that might be the cause?

A. So far as I know now, it is true that this might have existed on this well from the beginning. I do not now recall any information as to when this situation was first noticed.

Q. Now, what do you mean by a "little moisture"? How much moisture is "a little moisture"?

A. Enough so that it is noticeable when a well is blown but not enough to produce material difficulties in the operation of the well.

Q. Well, suppose we go to the Burnett well No. 1031A. It also has another number, namely, 1-81, in the Texas Panhandle Field. It is shown in Schedule 4, Page 8, Line 4 of Exhibit 17. When was that well completed?

A. That well was completed November 7, 1935.

Q. Why did you vary the procedure in determining the amount of depreciation to be deducted for that well? When I speak of "vary the procedure", I mean, why did you not use the straight one percent a year deduction method?

[fol. 2623] A. The information on this well is that this well does not feed properly, cause not determined.

Q. Will you enumerate the reasons why a well does not feed properly?

A. Well, there may be several reasons. It might not feed properly because of water in the well bore. It might not feed properly because of wetting of the producing sand in the neighborhood of the well bore. It might not feed properly because there was not any gas left. It might not feed properly because of caving of the well bore. It might not feed properly due to some construction in the flow string caused mainly by sand and rock particles having been carried upward in the flowing stream. It might not feed properly due to the deposition of salt in the producing sand.

Q. Would you put a figure of 20 percent depreciation on that well regardless of whatever caused that well to feed improperly?

A. No, I put that 20 percent on there because the cause had not been determined. If the cause had been determined, I might well have used a lesser percentage, depending on what the cause had been known to be.

Q. You would have used, I presume, your usual one percent a year deduction if you had known that the cause sprung from a condition that did not have to do with de-

[fol. 2624] preciation, is that a fair statement? A. Yes.

Mr. Culton: Mr. Littman, at this time, and so that the record may show, it might be advisable for me to state into

the record the meaning of the different identifications we have on these wells. We all understand it but the record does not show.

The name, for instance, with respect to the last well, I believe it was Burnett, refers to the name of the lessor. The No. 1, most of these have been No. 1 so far, refers to the number of the well on the lease, whether it is the first well, second well and so forth. The number following the dash, for instance 1-81 means that that was the first well drilled on the Burnett lease on section 81 and the next number, for instance 1031A, is the number of the well on the company records, representing the file in which the record of that well is found and "A" means it is in Texas.

The capital letters represent different States; I believe "A" for Texas, "C" for Kansas, "E" for Missouri.

Trial Examiner: What is the letter for Oklahoma?

Mr. Culton: I do not know whether it is "B" or "D", Mr. Examiner, because we do not have any wells there yet, but I assume it is "B" since it is coming up. We will soon have a "B" well since we are now drilling there.

By Mr. Littman:

Q. Now, this method which you have described gener- [fol. 2625] ally occurred and was used for 19 wells in the Panhandle Field and by that I mean the method other than the straight one percent a year method?

A. That is correct.

Q. And for only four wells in the Hugoton Field?

A. That is correct.

Q. And all the rest of them were straight one percent a year, to summarize your testimony? A. Yes, sir.

Q. Now, will you please turn to your list of wells in the Local Area and describe, generally, the method used to depreciate the wells in that Local Area? It was the depletion method, wasn't it?

A. The basis for depreciation on these wells is to depreciate them substantially on the basis of their rock pressure decline below 35 pounds, 35 pounds being estimated by me to be the economic pressure limit at which drilling would be justified in that area.

Q. In other words, when you came to the wells in the Local Area, you then did base the depreciation upon the exhaustion or depletion of the gas supply, did you not?

A. Not strictly so, no.

Q. Mostly so?

A. No, sir. I definitely did not use the depletion method of depreciating the value of gas wells in the Local Area.

[fol. 2626] I believe that when the rock pressure in a field has declined to the point at which the drilling of wells would not be economically justified, that the existing wells are depreciated through obsolescence substantially in the proportion that the existing rock pressure is below that figure at which drilling would be economically justified and it is upon that basis that I did depreciate the wells in the Local Area.

Trial Examiner: Mr. Littman, will you refer us to a list of wells that you classify as wells in the Local Area?

Mr. Littman: You mean other than Exhibit 62?

Trial Examiner: Yes.

Mr. Littman: I am sorry I cannot refer to a list in this record other than that which appears on Page 8 of Exhibit 62.

Trial Examiner: Do you wish that list that you were evidently using copied into the record?

Mr. Littman: I think it would be well at this point to copy into the record Column A which appears on Page 8 of Exhibit 62.

Trial Examiner: Excluded Exhibit 62.

Mr. Littman: Yes.

Trial Examiner: I will now hand the reporter that list and she may extend it into the record at this point since there seems to be no objection on the part of anyone.

[fol. 2629] By Mr. Littman:

Q. Mr. Biddison, have you completed your description of the method used for depreciating the gas wells in the Local Area? A. Yes, sir.

Q. Am I correct in understanding your method, that it was the depleted condition of the wells in the Local Area that caused you to find such a high rate or amount of depreciation?

A. It was the fact that depletion had occurred to such an extent that drilling of the wells would not now be justified.

Q. But this is an entirely different method of basis of depreciating wells than that which you used for the wells in the Hugoton and Texas Panhandle fields, is it not?

A. Yes, because it is an entirely different situation. I have tried to adapt the method to the situation that exists, or use a method adaptable to the situation that exists with respect to all these wells.

Q. That is to say, you did not use the physical condition method, so to speak, in determining the depreciation for the wells in the Local Area, did you?

A. No, sir, I did not, because I do not think that that would produce the measure by which they have lost value. I think they have lost value to a greater extent than the [fol. 2630] extent of their physical deterioration.

Q. In other words, the wells themselves in the Local Area are still in good physical condition, are they not?

A. Fairly good, yes.

Q. Notwithstanding the fact that you, in this case, disregarded that physical condition and looked rather to the depleted condition of the field to find the answer?

A. That is right.

Q. Now, is that condition going to someday come about in the Panhandle and Hugoton gas fields? A. Yes.

Q. Do I understand that there will come a time in the Panhandle field and the Hugoton field when you will change your method of determining the amount to be deducted for depreciation?

A. There will come a time when if I have a similar proposition before me, I will use a different method.

In other words, when the conditions in those fields are such that the drilling would not be justified if the wells were not already in existence, I would deduct for depreciation an amount generally in excess of that represented by the deterioration which had occurred, and would base the deduction upon the amount by which the rock pressure had declined below the point at which development was justified economically.

Q. Now, when were the last rock pressure readings [fol. 2631] taken on these Local Area wells?

A. 1936, in September.

Q. The data which you used, then, for determining your depreciation for the Local Area wells, was five years old, was it not? A. Yes, sir.

Q. Did you have any rock pressure reading on the first well in Kansas, called the Wendte No. 1-5003-C?

A. No, sir.

Q. What was the rock pressure reading in 1936 on the next well, the Day well?

A. Thirty pounds.

Q. Did you have any rock pressure reading on the next well called Tulloss No. 3? A. No, sir.

Q. The reading on the Tulloss No. 4 was what?

A. Sixty pounds.

Q. And the Tulloss No. 5?

A. Seventy-five pounds.

Q. The Borland No. 5?

A. Twenty-five pounds.

Q. The Borland No. 6? A. No test.

Q. The Borland No. 7? A. Fifteen pounds.

[fol. 2632] Q. The Ischey No. 1? A. Thirty pounds.

Q. The Detweiler No. 1? A. No test.

Q. The Lewis No. 1?

A. No test for rock pressure.

Q. Now, let's go through the wells in the Missouri Local Area, the Morgan No. 1?

A. Seventeen pounds.

Q. The Pendleton No. 1? A. No test for pressure.

Q. The Pendleton No. 2? A. Fifteen pounds.

Q. The Boten No. 1? A. Eighteen pounds.

Q. The Boten No. 2? A. Seventeen pounds.

Q. The Boten No. 3? A. Nineteen pounds.

Q. The Boten No. 4? A. Seventeen pounds.

Q. The Boten No. 5? A. Seventeen pounds.

Q. The Boten No. 6? A. Nineteen pounds.

[fol. 2633] Q. The French No. 1?

A. Fifteen pounds.

Q. The Rich No. 1? A. Twelve pounds.

Q. Those wells are all still in operation, are they not?

A. They were as of June 30, 1941, yes, sir.

Trial Examiner: They were all shallow wells that were rather inexpensive, were they not?

A. Very inexpensive wells, Mr. Examiner. The total estimate of original cost of these wells is only about fifteen thousand and some odd dollars. That is based upon the book cost of those wells for which a separate cost can be ascertained from the books and an estimated figure for other wells which were required in connection with leases and for which the separate cost of the wells could not be ascertained.

Trial Examiner: How old are they?

The Witness: I do not have a record here of the individual age, but some of these wells are in the neighborhood of ten years old. Some of them may be a little older than that.

Mr. Wheat: I may state in response to the Examiner's questions that I am informed by Dr. Bartle those wells were brought in starting in 1929 and 1930.

Trial Examiner: Thank you.

[fol. 2634] By Mr. Littman:

Q. Did you see any of these wells in the Local Area?

A. I have seen a few, not very many and I did not make specific notes as to any well in the Local Area. I saw a number of them in 1938 but I only saw a few of them which could be seen from the highways, driving through in the inspection of 1941.

Trial Examiner: These, I assume, are all dry gas wells?

The Witness: Yes, sir.

By Mr. Littman:

Q. Now, going back to the wells in the Panhandle and Hugoton fields, do I understand that you would expect to find the depreciation taking place at an accelerated rate along towards the end of the life of these wells?

A. Yes.

Q. In other words, it would be a rate higher on the average than 1 percent a year? A. Yes, sir.

Q. That being the case—assuming that that is the fact—your rate of 1 percent does not represent an average age over the entire life of the well, does it? I should have said "average rate" over the entire life of the well. I didn't mean to say "average age".

A. No, it doesn't. It represents my estimate of that which has occurred.

[fol. 2635] Q. I am now speaking of the 1 percent per year rate.

A. I am too. 1 percent per year is my estimate as the average figure for these wells to represent the amount of depreciation which has occurred in those wells except for those wells for which I have made other specific allowances as has been pointed out.

Q. But it doesn't represent the average rate that would be expected per year over the entire life of the well. Is that correct? A. That is correct.

Q. Would it be higher or lower over the average of life?

A. It would be higher over the average life.

Q. Now, Mr. Biddison, referring again to Exhibit 69 in lines 30 and 31, you make a deduction of $7,802.70 from book cost for depreciation of transmission measuring station structures, do you not? A. Yes, sir.

Q. How many transmission measuring and regulating structures are owned by Panhandle Eastern Pipe Line Company and its subsidiary, Illinois Natural Gas Company?

A. I don't have anything before me from which I can give you that figure.

Q. Can you give us a general figure?

A. No, I have nothing before me from which I can do [fol. 2636] that. I can refer to Exhibit No. 39 and obtain that figure, I believe; but I don't have anything before me now from which to obtain it.

Q. Will you please determine that figure at the next recess? A. Yes, sir.

Mr. Littman: Off the record.

(Discussion off the record.)

The Witness: This Schedule 8 is not a complete listing of those buildings.

Trial Examiner: Identify Schedule 8, Mr. Biddison.

The Witness: Exhibit 17.

By Mr. Littman:

Q. Well, suppose you supply the figure later on, Mr. Biddison, in order to save time.

You do know that there are a great many of these transmission measuring and regulating structures, are there not? A. Yes, sir.

Q. They run well up into the hundreds, do they not?

A. Yes, sir.

Q. How many of them did you personally observe and make inspection notes on?

A. Well, I will have to count that up.

Q. Can you give us the figure now?

A. It will take me some little time to make a deter-[fol. 2637] mination on that, to count them up.

Q. Do you have a general idea of how many you observed?

A. Under this classification I probably observed about 75.

Q. I see. Well, now, what percentage did you deduct for depreciation of the production stations in Texas?

A. 10 percent.

Mr. Wheat: And what stations are you talking about, measuring stations or something else?

Mr. Littman: The production stations.

Mr. Culton: What line is that?

Mr. Littman: I am not referring to any line.

Off the record.

(Discussion off the record.)

By Mr. Littman:

Q. You gave us the figure for your production stations in Texas and in Kansas? A. 10 percent.

Q. How about the Kansas Local Area?

A. 10 per cent.

Q. Missouri Local Area? A. 10 percent.

Q. Now, what percentage of depreciation did you deduct for the purchase stations in Texas?

A. 10 percent.

[fol. 2638] Mr. Culton: I am really asking for information. Do you mean purchase measuring stations and production measuring stations?

May I understand you one way. I don't know whether there is such a thing as a production station. There is a

production measuring station, of course, and I am just asking for information myself.

Mr. Littman: I am using Mr. Biddison's language and terms at this time. I would be glad to have him explain the meaning.

Mr. Culton: That is the reason I asked you which line you are talking about.

Mr. Littman: Transmission measuring and regulating station structures.

Mr. Culton: That is why I asked the question. You didn't use the word "measuring".

Mr. Littman: Of course, I am talking about the transmission measuring and regulating station structures.

By Mr. Littman:

Q. Now, we have gotten down through the Oklahoma purchase stations. How about Kansas purchase stations?

A. 10 percent.

Q. The Kansas Local Area? A. 10 percent.

Q. The Missouri Local Area purchase stations?

[fol. 2639] A. 10 percent.

Q. What percent of depreciation did you deduct for the wholesale sales stations, speaking now of transmission and regulating station structures in Texas? A. 10 percent.

Q. In Indiana? A. 10 percent.

Q. Now, Mr. Biddison, will you state how you arrived at the 10 percent figure for depreciation for the production stations in Texas, Kansas and Missouri?

A. From what I saw of their stations it is my estimate that 10 per cent of their value has been lost.

Q. Did you make detailed notes as to each station that you saw? A. Yes.

Q. Well, now, will you give us—

A. No, not as to each station I saw, but as to each station of which I saw enough to justify a notation.

There were numerous stations which I saw just in passing by on which I made no notations.

Q. Did you give the ones that you saw 10 percent in each case, or did you give some more or some less, and then average them up?

A. I gave them more or less, and upon reviewing my notes I used 10 percent as representing the average of all [fol. 2640] the observations, not the numerical average but the concluded average.

Q. They all look pretty much alike, don't they, Mr. Biddison? A. Yes.

Q. You couldn't tell from looking at any one of them what its age was, could you? A. No, sir.

Q. They are all painted, I presume. A. Yes, sir.

Q. What did you observe about these structures other than the paint on the outside that gave you enough information upon which to base a determination of a percentage depreciation?

A. Well, I noted whether the painting on it was in good condition and whether it needed paint. In some cases I noted whether or not there had been a thinning of the galvanized coating on galvanized sheets, whether the windows and doors were in good condition, and items of that nature.

Q. Did you examine any of the structures and I am now speaking of the transmission regulating and measuring stations structures in the Local Area? A. Yes.

Q. How many? A. I believe only one.

Q. How many of them are there in the Local Area? [fol. 2641] I think there are seven.

Q. You applied the percent depreciation to the remaining six based on the one that you saw in that area?

A. Yes, sir.

Q. And generally that same method was used throughout for the purpose of determining the amount to be deducted for depreciation on these structures? Is that not correct?

A. That is correct. My object was to see enough of the structures to form a conclusion as to the general condition in which they had been kept, and, from that to form a conclusion as to the amount of value which has been lost by depreciation.

Q. Do you know whether or not the ratio of those which you saw to those which you did not see was 1 to 10 or what, throughout the system?

A. I think it would be nearer about 1 to 3.

Q. Well, you will check that, will you not, during the noon recess and give us the figure based upon the actual count?

A. I will try to get that at noon.

Q. Now, are the measuring stations in the Local Area going to be of any value after the gas is totally exhausted in those wells?

A. No, except for such salvage as there may be there and there will be practically none in the structures.

Q. Now, that day is close at hand, is it not?

[fol. 2642] A. Yes, sir, it is.

Q. Yet you did not base depreciation of the structures in the Local Area upon the depleted condition of the field, as you did in the case of the wells in that field?

A. That is correct, I did not do so.

Q. Why?

A. On the production measuring station structures in the Local Area, I believe I should have depreciated them more heavily. However, as to the gas purchase stations in the Local Area they are not in quite the same condition as the production measuring stations because production is being maintained by these other producers and the life of those structures and that equipment will be considerably longer than for the company's own production.

Q. Mr. Biddison, is it simply a coincidence that you have so many flat 10 percents for deductible depreciation on these structures, some of which are located in Texas, others in Kansas and others in Oklahoma and others in Missouri?

A. No, it is the result of the fact that I think this property in general has lost 10 percent in value.

Q. Now, you mean your thought is general or the result is general?

A. The result is general. I think in general these properties have lost 10 percent in value.

Q. That is another round figure, is it not?

[fol. 2643] A. One of the digits in there is a round one. I don't think it would be possible to determine with a high degree of accuracy the amount by which these structures have depreciated without consuming a great many times the amount of time that was available in which to make a determination and without entailing an expense that would be almost as much as the amount of the figure we are trying to ascertain.

Q. Well, Mr. Biddison, some of those production stations in Texas and purchase stations in Texas, are approximately ten years old, are they not?

A. That is right, and some are of very recent construction.

Q. Now, according to Mr. Hinton these structures will be abandoned in fifteen years when, according to his estimate, the gas will be exhausted in the Panhandle field.

As a matter of fact, you used a remaining life of fifteen years in Exhibit 66, did you not, Mr. Biddison?

A. That is substantially right, yes.

Q. Now, insofar as all of those production stations and purchasing stations in the Texas field are concerned, they only have a remaining life of fifteen years, don't they?

A. That is right.

Q. And some of them having been built in 1931 have had almost a half of their life exhausted by now, have they not?

A. Well, if they are ten years old and have fifteen [fol. 2644] years of future expectancy, 40 percent of the life has expired.

Q. But, of course, you didn't relate your percentage to be deducted for depreciation to the life of that property, did you? A. Certainly not.

Q. Or of any property in the Panhandle Eastern System with some minor exceptions?

A. That is correct, because I do not think that the relationship of age to the life fixes the amount by which property has depreciated.

* * * * * * * *

[fol. 2647] The Witness: The deduction in column D, line 36 on Exhibit 69, is the composite result of the deductions from several groups or classifications of measuring station equipment.

[fol. 2648] On some of this equipment the deduction is 5 percent, some is 10 percent, and some is 15.

By Mr. Littman:

Q. Have you completed your answer, Mr. Biddison?

A. Yes.

Q. Now, coming back to the deduction of the flat 5 percent for the equipment in the Local Area, is it your

testimony that the salvage value of that equipment is anything like 95 percent?

A. No, I didn't testify to that.

Q. You know that the field is about to be abandoned, do you not?

A. I know that the company owned wells are about to be abandoned.

Q. And what is going to happen to this equipment?

A. It will be used at other locations for similar purposes.

Q. By Panhandle Eastern? A. Yes.

Trial Examiner: Let me ask you, Mr. Biddison: This testimony you have been giving about the depreciation, the last few pages of questions and answers, have you been basing your deductions for the depreciation covering the life consumed in any way on a prospective salvage value? Has that been taken into consideration?

[fol. 2649] The Witness: No, sir, Mr. Examiner. What I have taken into consideration was simply the amount of value which I believed to have been lost, that value being fixed after investigation of the property.

Trial Examiner: You are not basing it on salvage value or on depletion, but rather on physical conditions?

The Witness: That is correct.

By Mr. Littman:

Q. Will you describe briefly what this regulating station equipment looks like? I am speaking about regulating and measuring station equipment generally.

Trial Examiner: You probably mean of what does it consist, don't you, Mr. Littman?

By Mr. Littman:

Q. Of what does it consist. I don't mean for you to go into great detail on that, Mr. Biddison.

Mr. Culton: I think Mr. Burnham's Exhibit has a photograph of it, if I am not mistaken.

The Witness: The measuring and regulating stations consist in general of pipe running into the station lot from the transmission main and have attached a meter either

of the orifice type or of the displacement type, and a regulator whose function is to automatically reduce the pressure of the incoming gas from whatever pressure that may be, to a uniform predetermined pressure.

[fol. 2650] The gas may pass first through the meter and then through the regulator, or the reverse order may be used.

The regulating device and the meter are in some cases housed in a single structure and in some cases they are separately housed. Regulation is not always performed in connection with measurement, but in the case where both functions are performed the gas is again conducted through a pipe from the site of the measurement and regulation, back to the transmission main, there being a cutoff valve in the transmission main between the inlet connection to the measuring station and the outlet connection from the measuring station, -

Now, in connection with this measuring and regulating equipment there are valves of various sorts and sizes; quite often there are welded steel headers, and generally there are recording gauges to record the pressure, and in the case of displacement meters the volume, which passes through the meter, as well, and in the case of orifice meters and gauge would record the pressure on the orifice and the pressure drop across the orifice.

Some of these stations are multiple stations; others may have two or more runs of pipe through such a station with the appurtenant meters and fittings and regulators.

. . . . . .

[fol. 2651] Q. Now, have you examined a number of stations in which that equipment is?

A. Yes, sir I have.

Q. On the average, how much time did you spend at each station examining the equipment?

A. Probably ten minutes?

Q. And what did you do during that ten minutes in order to determine this percent?

A. Looked at the equipment, looked the equipment over.

Q. What did that consist of: just having a look around?

A. That is right.

Q. Did you open up any of the equipment and take a look inside?

A. No, sir, I did not.

Q. That can be done, can it not, on certain of the equipment?

A. It can be by shutting the station down or taking part of it out of operation.

Q. Well, did you look at the works in the meters?

A. No, sir.

Q. You can do that without shutting it down, can't you?

A. No, sir.

Q. What equipment could you make a thorough examination of without shutting down the station?

[fol. 2652] A. The outside surfaces of all of it, and that is all.

Q. Is it much of a trick to shut down a station and start it up again?

A. Well, these stations which are serving communities must be kept in operation or some other means provided whereby the communities can be supplied with gas. If it is a measuring station on a well it requires shutting off the well.

Q. Do these stations have by-passes?

A. The measuring stations to some of the distribution plants would have by-passes, but those on wells generally not.

Q. Well, what about the pipe in the station? Did you examine that? A. Yes.

Q. What did you see outside of the paint on the pipe?

A. That is about all you could see, and I determined that it was kept well painted and there were very seldom any indications of any corrosion whatever.

Q. You didn't scrape the paint off of this pipe? A. No.

Q. Did you observe any depreciation on any of the equipment other than merely the deterioration in the paint?

A. That is about all I could see.

Q. Do you have any working papers that show any detailed study of this equipment?

A. You have had all the working papers that I have [fol. 2653] on that matter.

Q. We don't have any papers that show any detailed study and we assume that that is the fact.

A. There is not much detail to the study. I have observed the equipment and reached a conclusion as to the amount by which it has lost value.

Q. You didn't put down a percent for each part of the equipment that is housed in these regulating and measuring structures, did you?

A. No, sir, I did not.

Q. It was just a general percentage estimate for the whole works, was it not?

A. That is correct.

Q. Based upon what you have referred to as your judgment? A. Yes, sir.

* * * * * * * *

[fol. 2659] By Mr. Littman:

Q. Well, let us then discuss the $40,001.80 of gathering lines other than Local Area lines which is included in Line 20 of Exhibit 69.

Is my understanding correct that you made a deduction of 10 percent for depreciation of those $40,000-odd worth of lines? A. That is correct.

Q. How many miles of well lines are represented by that account? I am still talking about the $40,000-odd.

A. I do not know.

[fol. 2660] Q. Can you give us a rough idea?

A. No, I cannot. I have not any figures on this available here.

Q. Did you make any detailed inspections on any of those lines? A. Yes.

Q. How many inspections did you make?

A. I am not certain of the division of my observations between what are classed well lines on Exhibit 69 and other lines but as to what I have called well lines in my compilation for Exhibits 39 and 62, I have but one observation on a well line and that would generally correspond to gathering lines as shown at Line 20 on Exhibit 69.

There may be some of the others of my observations which really would apply on what is classed on Exhibit 69 as gathering lines but I cannot sort it out here.

Q. Well, I understand your testimony to be on direct examination that you did not make any detailed inspections of these gathering lines but that you applied the findings on other gathering lines to these particular gathering lines which you had classed at one time heretofore in this proceeding as well lines.

A. That is substantially right. However, I find my notes do show that I inspected Line AW-1032 and the designation "AW" means that it is a well line in Texas. [fol. 2661] Q. Did you make any inspections on the $18,695 worth of Local Area gathering lines that you mentioned a moment ago? A. I did not.

Q. So that out of the total of $59,707.45 which appears in Line 20 of Exhibit 69 entitled "Gathering Lines," you made the one personal inspection?

A. That is correct and I based my deduction upon the condition found on other lines in the area as respects the gathering lines in Hugoton Field and Panhandle Field.

. . . . . .

[fol. 2674] By Mr. Littman:

Q. Now, referring to the gathering lines in the Local Area which you claimed have a book cost of $18,695.65 and which you claimed you found 80 percent depreciated, what method did you use to determine the depreciation for those lines, bearing in mind that you have already stated that you did not inspect those lines.

A. The method which I used was to give consideration to the fact that many of those lines would have short future life, that a great deal of it had never been very well protected when it was originally laid and that its value as of today was not greatly in excess of junk value so I just depreciated it 80 percent.

Q. It was based very largely, was it not, upon the depletion of the gas supply?

A. No, sir, rather upon the fact that the life of those lines in any one location in that area is short and total supply of gas in that area, from wells not owned by Panhandle Eastern Pipe Line Company; is expected to con- [fol. 2675] tinue for quite a long while but the life of individual wells is short and these lines require considerable shifting and rearranging to keep up with the shift in the center of production.

For that reason, I am satisfied, upon inquiry, that the lines themselves have suffered considerable physical depreciation, and it is also true that loss through obsolescence is imminent on a good deal of that property so, combining all of the factors, it is my judgment that they are worth about 20 cents on the dollar so I depreciated them 80 percent.

Q. When you speak of obsolescence in this instance, you are referring to obsolescence by reason of the depletion of the gas field or by reason of the depletion, rather, of the wells served by these lines?

A. That is right.

Q. In other words, this is an entirely different method used by you in the Local Area than was used by you in determining the percent of depreciation for similar lines in the Panhandle Field and Hugoton Field, is that corect?

A. Yes, sir, because the conditions are different. I applied a method which I thought would account for the conditions.

Q. Now, what condition usually brings about the retirement of a line that serves a well which you have sometimes referred to here as well lines and which is classified here as gathering lines?

[fol. 2676] A. The line may become pitted, rusted out, for one thing. As the well becomes old and the rock pressure lower, they may become inadequate for another thing and require to be changed on that account.

This is quite a common reason because, as the rock pressure declines, in order to maintain production it often becomes desirable to install well lines of larger diameter.

Another factor, of course, is the failure of the well itself.

Q. That is to say, the exhaustion of the gas in the well served by the line?

A. Yes, sir.

Q. Isn't the last cause the most prevalent one for lines that serve individual wells?

A. I think so, yes, sir.

Q. That is to say, may we not agree that ordinarily the well line will outlast the supply of gas coming from a particular well, physically?

A. No, I would not say that. I would not say that. I will agree with you, however, that exhaustion of the gas supply of a well is the most common cause for retirement of a well line.

Q. You fully expect that to be the case with the well lines or gathering lines that serve particular wells in the Panhandle Field, would you not, inasmuch as according to [fol. 2677] your testimony that field will be exhausted, according to your Exhibit 66, within 15 years from today?

A. I expect the bulk of the retirements of well lives in that area to be due to exhaustion of gas supply, yes sir.

Q. And what would you say with respect to the lines in the Hugoton Field?

A. The same thing.

Q. Now, let us proceed to the lines called "Transmission Mains" shown in Exhibit 69 at Page 1 on Line 37:

How many miles of gathering lines are included in the classification labeled "Transmission Mains", from the book cost of which you deducted $2,741,396 for depreciation?

Incidentally, when I speak of gathering lines now, I am not referring to the trunk gathering line, so-called, by you running from Windmill Junction northward.

A. I do not believe I have any figure with me from which I can give you that.

Q. Will you furnish that figure later in order to save time?

A. I will try and obtain it for you, yes, sir.

Q. Incidentally, before I forget, are you prepared to state now how many transmission station metering and regulating structures there are in the Panhandle system?

A. No, sir, I did not get an opportunity to get that compilation made.

. . . . . .

[fol. 2680] By Mr. Littman:

Q. Mr. Biddison, I believe you were going to tell us the approximate mileage of the gathering lines other than the trunk gathering line which runs from Windmill Junction north. When I use the term "trunk gathering line" for that Windmill Junction line, I am, of course, using your term, you understand.

A. Excluding the 22 inch line from Windmill Junction to Liberal Station, according to the statement in Schedule 11 of Exhibit 17 there are approximately 383 miles of gathering lines outside of the Local Area.

Q. How many inspections did you make on those 383 miles of gathering lines?

A. Forty-nine.

Q. Were you present at each of those inspections?

A. Yes.

Q. Now, what is the approximate length of the line which you have called a trunk gathering line, extending from Windmill Junction, Texas to Liberal Compressor Station in Kansas?

A. I believe it is about 110 miles.

Q. How many inspections did you personally make on that line?

A. Thirty-nine.

Q. Did you make any inspections on the Beaver River [fol. 2681] crossing on that line?

A. No.

Q. On Cimarron River crossing of that line?

A. Yes, sir.

Q. You deducted approximately 5 percent, did you not, for this so-called trunk gathering line, for depreciation?

A. Yes, sir.

Q. How did you make a determination of the percent to be deducted for the Beaver River crossing which, as you say, you did not inspect?

A. I included it with the balance of the lines.

Q. You did not apply the finding made by you upon inspection of the Cimarron River crossing to that of the Beaver River crossing, did you?

A. No, sir.

. . . . . .

Q. What percent did you deduct for depreciation of the Cimarron River crossing which you state you inspected?

A. I used 95 percent.

Q. 95 percent condition or 5 percent—

A. Or 5 percent deduction, yes, sir.

[fol. 2682] Q. What was the deduction for depreciation on the Beaver River crossing which you did not inspect?

A. 3 percent.

Q. Now, if you had applied the finding by inspection of the Cimarron River crossing to that of the Beaver River crossing, you would have deducted approximately another 2 percent, would you not, for depreciation?

A. Yes, sir.

. . . . . .

Q. Now, Mr. Biddison, you stated that you have determined the percent to be deducted for depreciation for the Beaver River crossing from the other inspections which I take it were not at river crossings. Is that correct?

A. Yes.

Q. That is, for this line.

[fol. 2683] A. Yes. It is in at the same percentage of deduction for depreciation as the balance of the line in the state of Oklahoma.

Q. Now, how did you arrive at such a conclusion as that, not having made any inspection at all on the Beaver River crossing?

A. My conclusion was that in view of the conditions noted on the pipe line, that an allowance of 3 per cent for that section of the line including the river, was an ample allowance for the depreciation which had occurred upon it.

Q. You are merely restating your conclusion, Mr. Biddison. I wanted you to give me the reason for the conclusion.

A. The reason for it is that having made the inspection it is my opinion that a 3 percent allowance for depreciation upon that section of line, including the river crossing, was an ample allowance for the depreciation which had occurred.

Q. That is not the method you used for determining the percent to be deducted for depreciation on river crossings on the main line, was it?

A. No, sir. I think it was in some instances but not in all of them.

Q. Why did you vary your method here from the usual one followed, or was there no reason for it particularly?

A. Well, I could have done it this way or some other [fol. 2684] way, but I just picked out this method to do it. That is all.

Q. Wouldn't you ordinarily expect to find conditions at river crossings, where, as here, the crossing is under the

river, different than conditions ordinarily found elsewhere on such a line?

A. Yes.

Q. River crossings such as the one at Beaver River, you would ordinarily expect to find in a further depreciated condition that elsewhere ordinarily, would you not?

A. Yes.

Q. Well, let's turn to main lines, and when I use the term "main lines" now, I am referring to the main transmission line running from Liberal Compressor Station north and east to Dana Station at the Indiana-Illinois State Line.

I exclude the lateral lines from this term, and I include the loop lines within the term.

Will you please state the approximate mileage of the main lines as I have defined them?

A. Approximately 1,157 miles.

Q. And how many inspections did you personally make on those main lines?

A. 298.

Q. Will you state the percent which you deducted for depreciation of the main lines within the meaning of the ferm as I have defined it?

[fol. 2685] A. Approximately 3.6 percent.

Q. Now, of course, that is the largest account, isn't it?

A. Yes, sir.

Q. What is the size of pipe embraced within the meaning of that term?

A. 20 inch, 22 inch, and 24 inch.

Q. Now, there are a number of river crossings on the main transmission lines, are there not?

A. Yes, sir.

Q. How many of those river crossings did you personally inspect? When I use the term "inspect", Mr. Biddison, I mean a detailed inspection.

A. I believe only on the Arkansas and the Missouri and the Mississippi Rivers.

Q. The Mississippi River crossing is an overhead crossing, is it not?

A. There is both an overhead crossing and an underwater crossing.

Q. Which one did you make the detailed inspection on?

A. Both. Of course, on the underwater crossing we had to excavate to see the pipe. The overhead crossing was visible from the bridge and from the approach.

Q. I see. Well the Arkansas River crossing is on the main line, called Kansas Line 100, is it not—well, and Kansas Line 200, the latter of which is the loop line?

[fol. 2686] A. That is correct.

Q. You did not make any examination, I take it, or detailed inspection, of the Neosho River crossing in Kansas?

A. No, sir.

Q. Or the Osage River crossing?

A. No, sir, I did not.

Q. How did you determine the percent of depreciation for those latter two river crossings, Mr. Biddison, not having inspected them?

A. I used my judgment and assigned a figure that I thought was ample to cover any depreciation that might have occurred upon them.

Q. Your judgment in that regard was based upon what facts?

A. Upon the inspections I did make on river crossings and upon my knowledge of the general care in maintaining this property.

Q. Well, can you tell the condition of one river crossing by examining another river crossing, especially when they are two different rivers?

A. No, but one can form an enlightened judgment as to what the condition of the property in general is by making observations upon selected items of that property.

That is the general practice in sampling and in inspection.

Q. Why didn't you inspect the Neosho River crossing [fol. 2687] and the Osage River crossing?

A. Purely and simply because there was a dead line set as to when I had to appear before this Commission with the data which I was accumulating.

Q. That is to say, you did not have ample time to make the inspection?

A. That is correct. However, I did make such inspections as would, in my judgment, be required to determine

the value and condition of the property for the purpose of purchase or sale.

. . . . . .

Q. Well, there are two crossings at each of these three rivers, if I correctly understand you, are there not, Mr. Biddison, that is one for the loop line and one for the main line?

A. I am not sure I know which three rivers you are talking about.

Q. I am referring to the Arkansas River, the Neosho River and the Osage River.

A. That is correct.

Q. And you applied your findings by inspections on the Arkansas River crossings, to those of the Neosho River [fol. 2688] crossings and the Osage River crossings, did you not?

A. That is right.

. . . . . .

[fol. 2689] Q. Now, Mr Biddison, there are some river crossings on the main lines entitled "Main Line 100" and "Loop Line", "Main Line 200", are there not?

A. Yes, sir.

. . . . . .

[fol. 2690] Q. The Missouri and the Mississippi River crossings. You did not examine the Lamine River crossing, did you?

A. No, sir.

. . . . . .

I applied to the Lamine River crossing the data which I derived from the Missouri River crossing.

Q. Now, at what hour of the day or night did you make an inspection of the Missouri River crossing?

A. This inspection was made on August 22, 1941.

Q. Do you recall what hour of the day or night it was that inspection was made by you?

A. I believe this was rather late in the evening.

Q. Do you remember what time it was?

A. No, I made no record of the time of day of any inspection.

Q. As a matter of fact, this inspection was made by you after dark, wasn't it?

A. Partially so.

Q. You took a picture at this inspection point too, did you not, Mr. Biddison?

A. Yes.

[fol. 2691] Q. That is, with your camera, the same one that you described a moment ago?

A. Yes, sir.

Q. And you used a flash bulb to get that picture, did you not, because of the darkness?

A. I did in an attempt to get that last picture.

Q. What was the last answer?

A. I did in an attempt to get the last picture.

Q. We are referring now to the Missouri River crossing?

A. Yes, sir, and I say in an attempt to get the last picture at that river crossing I used a flash bulb.

Q. Did you take any other pictures at this particular crossing?

A. I believe so. I made two shots at that river crossing, one on the group of lines on Line 100 and one on the group of lines on Line 200.

Q. Which one of those lines was inspected by you after dark?

A. Group of lines on Line 200.

Q. Do you know a Mr. George Shattuck who is a member of the engineering staff of the Federal Power Commission? A. Yes, sir.

Q. He was present with you at that latter inspection, was he not? A. Yes, sir.

. . . . . .

[fol. 2693] By Mr. Littman:

Q. What is the fact with respect to these two river crossings, Mr. Biddison? Will you give us a description of these two river crossings?

A. On the Missouri River?

Q. I am talking about the Mississippi.

Mr. Wheat: The Examiner asked about the Missouri.

. . . . . .

[fol. 2694] The Witness: On the Missouri River both the crossing on the original Line 100 and on the Loop Line 200, or underground crossings, multiple crossings.

Mr. Wheat: You mean underwater crossings?

The Witness: Yes, sir, laid in the stream bed and the multiple lines on each side of the river carried up to comparatively high ground to be out from the flood plain.

On the Mississippi River crossing the original crossing is on a bridge and in 1936 an additional crossing of the Mississippi River was made upstream from the bridge as a multiple line underwater crossing.

Q. Now, when you make an inspection on a river crossing that passes under the river, what kind of an inspection do you make? You don't look at the pipe in the water, do you?

A. I did not do so.

Q. Is that usually done, or can it be done?

A. Well, it can be done by going in there and taking off the probable five to six feet of cover and sending a diver down, but otherwise it cannot be done.

Q. What is the method you used?

A. What I did was to look at the pipe on the multiple line approaches to the stream.

Q. Is that on one side or both sides?

A. I looked only on one side.

Q. How far was that ordinarily from the bank of the [fol. 2695] river?

A. Well, on the Missouri River that was about a quarter of a mile, I believe, possibly one-half.

Q. Why didn't you make your inspection at a point closer to the river than one-quarter of a mile or one-half of a mile?

A. Because we were in the flats where we had the river bottom soil and river bottom conditions and I picked a location that would be fairly accessible.

Trial Examiner: May I ask, Mr. Biddison, if you are able to state, what is the effect of corrosion on these pipes that are laid under river beds? Is it greater or less or similar to the corrosion in the ordinary soil?

The Witness: It is very much less than the corrosion which you ordinarily experience on the land approaches to the streams.

Pipe lines continuously submerged in water, except in some rather unusual cases where you might have mine water overflow or drainage from some chemical plant that would produce a high acid condition of the water, show very little effects of corrosion after a great many years and, that is true even on lines laid under salt water.

These lines under salt water will quite generally corrode at the water line where the pipe is subjected both to the salt in solution and oxygen from the air, but those parts [fol. 2696] continually submerged corrode very, very slowly, and will last a great many years without any difficulty from pitting.

I have never known of difficulty in the stream bed of an ordinary river from pitting.

Mr. Wheat: May I ask a question also along that line?

Are any of the crossings of this line we are talking of in this case, the river crossings, so located as to be just below a mine or some chemical plant such as you mentioned in your last answer?

The Witness: Not on the main lines. There may be some minor situations in that respect with regard to some of the smaller lateral lines in the state of Illinois.

By Mr. Littman:

Q. I take it from the answer you have just given that the depreciation on well constructed underwater crossings then, would be very slow?

A. Yes, sir, it would be very low. The underwater crossings may require a high rate of accrual to maintain them against factors other than the deterioration of the pipe, but as to deterioration of the pipe itself in such a stream crossing, that is very slow.

Q. I take it from your last answer that the annual allowance for depreciation in such instance should be high, but that the deduction for depreciation from book cost [fol. 2697] should be very low.

A. Comparatively so, yes, sir.

Q. Did you make any tests of the waters in these rivers to ascertain their corrosive effect on these main lines?

A. No, sir, I did not.

* * * * * * * *

[fol. 2700] Q. Now, what kind of inspection did you make of the overhead river crossing of the Mississippi River?

A. Well, the inspection on the Mississippi River I find was confined to the overhead crossing and I simply looked at it as we went over the bridge.

Q. In an automobile?

A. I believe we got out on the east side and went down below the bridge approach to look at the pipe bends at that side of the crossing.

Q. How much time did you spend looking at the pipe [beds]?

A. Just a few minutes.

[fol. 2701] Q. The rest of your inspection of that overhead river crossing consisted of looking at it while driving by in an automobile?

A. I looked at what could be seen from the approach on the west side too. I do not believe I got out of the car at that point, though.

Q. I see. And, of course, in that time you had no opportunity to uncover the pipes?

A. No, made no attempt to uncover them.

Q. Then, in reality it appears that you made actual inspections on two river crossings—by actual inspections I mean detailed inspections—namely, the inspection of the Missouri River crossing, that is two of those, and one of the Arkansas River crossing. Or was it two on the Arkansas River?

A. One crossing on the Arkansas River.

Q. My statement then is correct?

A. Two on the Missouri and the overhead crossing on the Mississippi.

Q. And you applied your findings on those, one of which was determined by an inspection made after dark, to all the other river crossings of the main lines, is that correct?

A. Well, I based my deduction for depreciation upon all the other main line river crossings upon the observations that I made at the ones which I did inspect.

[fol. 2702] Q. Now, there are a number of river crossings on the Illinois Line number 100 and the Illinois loop line number 200, are there not? A. Yes.

Q. Am I correct in stating that there are two river crossings, namely, the South Sangamon River and the Illinois River?

A. On Line 100, yes, sir.

Q. And, of course, you made no inspections on those rivers? A. That is correct.

Q. Now, the lateral lines have some river crossings, too, have they not? A. Yes, sir.

Q. By the way, did you make any inspections on any of the lateral lines? A. Yes, sir.

Q. Which lateral lines did you inspect? When I use the term "inspect" I mean to make a detailed inspection.

A. 96 lateral line inspections were made.

. . . . . .

[fol. 2707] P. McDonald Biddison, a witness, having been previously duly sworn, resumed the stand, was examined and testified as follows:

. . . . . .

[fol. 2709] Cross-Examination (Continued).

By Mr. Littman:

Q. Mr. Biddison, at the close of last Friday's session, we were discussing the account in Exhibit 69, Page 1, Line 37, titled, "Transmission Mains."

I believe you stated that there were approximately 1,157 miles of main lines included within this account, including the loop lines, as distinguished from gathering lines, trunk gathering lines, lateral lines and Local Area lines.

[fol. 2710] I do not recall at the moment whether you stated how many inspections had been made on the main lines thus classified. Could you give us that figure, please?

A. 91.

. . . . . .

Q. What I am seeking is the breakdown of the account entitled, "Transmission Mains" shown in Line 37 of Ex-

hibit 69 in the amount of $46,511,611.72 as between gathering lines, the figure of which I believe you gave us, trunk [fol. 2711] gathering line, main lines including loop lines, lateral lines and Local Area lines.

Can you state what percent condition you found or, stated conversely, what percent of depreciation you deducted for the main lines, including the loop lines?

A. In determining the deduction for depreciation on transmission mains in Exhibit No. 69, I did not break that item down into the detail which you have mentioned.

I weighed out my determinations on the classification which I had used in connection with the determination of reproduction cost and in that determination I had depreciated transmission mains.

I have divided the item of transmission mains, amounting to $46,511,611.72 into $1,666,783.92 of Local Area transmission mains and $44,844,827.80 of other transmission mains. I have depreciated the Local Area transmission mains 49.6363 percent and I have depreciated the $44,844,827.80 of other transmission mains 4.2682 percent.

The amount by which I have depreciated Local Area mains is $827,329.86. The amount by which I have depreciated other transmission mains is $1,914,066.95. The two make a total of $2,741,396.81.

Trial Examiner: When you said local transmission mains, Mr. Biddison, you are referring to the Local Area production, so-called, in this proceeding?

[fol. 2712] The Witness: The mains in the Local Area around Kansas City, yes, sir.

Trial Examiner: You are not referring then to well lines in the field, that is, in the major fields of Hugoton and Panhandle?

The Witness: No, sir.

Mr. Wheat: Nor are you referring, Mr. Biddison, to so-called lateral lines, are you?

The Witness: I am referring, in that connection to the lines in the local area field around Kansas City as they are

so classified upon the books of Panhandle Eastern Pipe Line Company.

By Mr. Littman:

Q. Then it is the $44,844,827.80 figure that includes the lateral lines, is it not? A. Yes, sir.

Q. And the so-called trunk gathering line of 110 miles which you spoke of last Friday? A. Yes, sir.

Q. And it also includes some gathering lines, too, does it not? A. Yes, sir, it does.

Q. You are not prepared to give us a breakdown of that $44,844,000 figure as between the classes that I just named, are you?

[fol. 2713] A. No, sir, I did not make such a breakdown of the miles and do not have the data for such a breakdown. I think I would have to get that out of Kansas City.

Q. What were the figures against which you applied your basic percentages?

A. My basic percentages were applied against reproduction cost new and in weighing the observations out against the general class of the property, I found that the weighted amount to be deducted on this item of $44,844,827.80 of transmission mains, other than local area, as carried on the books, was 4.2682 percent.

Q. In other words, in securing the percent of depreciation to be deducted of 4.26 percent for transmission mains other than the Local Area transmission mains, you did not ascertain a separate percent for each of the classes of other transmission mains, did you?

A. Not for each of the classes as they are classed in the accounts. I did not weigh my observations out by classes on the book cost of property.

I weighed them out on reproduction cost of property and applied the resultant figure to the total book cost.

* * * * * * * *

[fol. 2714] Trial Examiner: Mr. Biddison, when you made an inspection to determine the existing depreciation in a certain piece of property, would you have a different conclusion as to the existing depreciation if you had made that inspection as a preliminary to a computation of reproduction cost new less depreciation than if you had been

making your inspection without reference to any estimation of reproduction cost new?

The Witness: No, I would have had identically the same figure—

Trial Examiner: (Interposing) Of existing depreciation.

The Witness: (Continuing)—I made a determination of what proportion of value had been lost and what I deter- [fol. 2715] mined was the proportion of value and then I have applied that to at least two different methods that might be considered in determining the value. My proportion would be the same, no matter how the value was obtained and my proportion would be the same, no matter what the cost was, whether it might be considered high or low.

* * * * * * * * *

The Witness: In an estimate of reproduction cost new? I determined that, based upon that reproduction cost, the percentage of value to be deducted for depreciation which had occurred in the property on well lines, gathering lines, [fol. 2716] trunk gathering lines, main lines and lateral lines, excluding any Local Area lines of any sort, character or description, was $1,710,828.99.

That was on property in the amount of $40,083,188.80 and amounts to 4.2682 percent.

I have, therefore, in Exhibit No. 69, depreciated $44,844,827.80 of book cost of well lines, gathering lines, trunk gathering lines, main lines and lateral lines by 4.2682 percent or in the amount of $1,914,066.95.

Now, in addition to that amount of depreciation on the book cost of what, in Exhibit 69, is called "Transmission Mains" and which does include all of the lateral lines, all of the main lines, the trunk gathering line and the greater part of the gathering lines and well lines, I have depreciated $58,707.45 of gathering lines, so-called, upon the books of Panhandle Eastern Pipe Line Company by $18,957.70 which is composed of $14,956 52 of deduction for Local Area lines and $4,001.18 of other gathering lines.

The proportion in which the Local Area lines have been depreciated is by 80 percent applied to $18,695.65. The proportion by which the other lines have been depreciated is 10 percent applied to $40,011.80.

Now, the amount of $58,707.45 of gathering lines, as now classified in Panhandle Eastern Pipe Line Company's accounts, represents gathering lines which have been classi-
[fol. 2717] fied in accordance with the requirements of the Federal Power Commission.

* * * * * * * *

[fol. 2719] By Mr. Littman:

Q. Have you completed your answer? A. Yes.

Q. Mr. Biddison, did you make any inspections on the loop lines that were installed in 1938?

A. No, sir, I did not. I did inspect some of the 1937 loop lines but I believe none of the 1938 loop lines.

Q. Did you inspect any of the looped lines that were installed in 1939?

A. No, sir, I did not.

Q. Did you inspect any of the loop lines that were installed in 1940?

[fol. 2720] A. No, sir, I did not.

Q. Were there any installed in the first six months of 1941, that you recall?

A. I think there was a little bit of construction work still in progress from last year's program.

Q. You did not examine any of the loop lines that were installed in the first part of 1941? A. No, sir.

Q. Now, those loop lines which I have named which were installed in the years 1938, 1939 and 1940, and which you did not inspect, constitute a rather substantial part of the present transmission mains, do they not?

A. Yes, sir.

Q. Don't take the time to look it up now, but can you tell me approximately how many miles of loop lines were installed in total?

A. I would have to look it up to give you anything within reason.

Q. Well, do you have a copy of Exhibit 15, Mr. Burnham's map of the system?

A. No, I do not have a copy of it.

Q. I believe Mr. Burnham's map, Exhibit No. 15, shows in light green color the loop lines that were installed in 1939 and 1940.

A. I have some figures here that indicate that the 1939 [fol. 2721] and 1940 program was about 133 miles.

Q. Did you make any deduction whatever for depreciation on any of the loop lines installed in 1938, 1939, 1940 or 1941?

. . . . . .

The Witness: On the Liberal loop in 1937 construction, I deducted one percent; on the 1939-40 construction, I deducted nothing.

On the Greensburg loop for the 1937 construction, I deducted one percent; for the 1939-40 construction, I deducted nothing.

On the Haven loop for the 1937 construction, I deducted one percent; for the 1939-40 construction, I deducted nothing.

For the Olpe 1937 construction, I deducted two percent; for the 1939-40 construction, I deducted nothing.

For the Louisburg loop for the 1937 construction, I deducted one per cent; for the 1939-40 construction, I deducted nothing.

For the Houstonia loop for the 1937 construction, I [fol. 2722] deducted two percent; for the 1939-40 construction, I deducted nothing.

For the Centralia loop for the 1937 construction, I deducted one percent; for the 1939-40 construction, I deducted nothing.

For the Pleasant Hill loop for the 1937 construction, I deducted one percent; for the 1939-40 construction, I deducted nothing.

So, in general, I deducted one to two percent on 1937 construction and nothing on the later construction.

In two sections, however, I deducted two percent on 1937 construction based upon the fact that they were the sections in which depreciation appeared to have taken place the most rapidly on the older construction.

By Mr. Littman:

Q. In other words, to summarize, you made no inspections on any of the looped lines constructed subsequent to 1937?

A. That is correct.

Q. And you placed that all in 100 percent condition?

A. Yes, sir.

Q. Notwithstanding the fact that some of them were two and one-half years old as of June 30, 1941?

A. That is correct—not 2½ years, 1½ years.

Q. Well, it would be closer to two, wouldn't it?

A. No, it would be closer to 1½. They were completed along at the close of the year.

. . . . . .

[fol. 2724] Q. We would appreciate your securing it at your early convenience.

Now, the main line in the Local Area to which you alluded a few minutes ago were not personally inspected by you at all, were they?

A. That is correct.

Q. That is the Local Area main lines. I believe you answered a similar question with respect to Local Area gathering lines?

A. Yes, sir, and a similar situation exists with regard to Local Area well lines. The same situation exists with regard to all lines classed as Local Area lines.

Q. Am I correct in stating that you used a flat 25 percent deduction for depreciation on the main lines in the Local Area? I believe you testified to that at transcript Page 1193.

The Witness: Will you read me that question?

[fol. 2725] (Whereupon, the pending question, as recorded, was read by the reporter.)

The Witness: No, that is not correct. In connection with Exhibit 69, I just explained here a short time ago what I did with respect to the lines in the Local Areas.

Mr. Wheat: I think the deduction was around 80 percent, was it not, Mr. Biddison?

The Witness: The deduction was 80 percent upon those lines which, in Exhibit 69, are called gathering lines and the deduction was 49.6363 percent for the other Local Area lines included in the group of transmission mains on Exhibit 69.

Now, I think likely that the figure you are referring to was used with regard to a certain group of those transmission mains as classified in my reproduction estimate.

. . . . . .

By Mr. Littman:

Q. Well, whatever your deduction was for depreciation on the main lines in the Local Area, it was not based upon inspection, is that correct?

[fol. 2726] A. That is correct. It was not based upon inspection because I made no inspection.

Q. What was it based on?

A. It was based on the consideration of the field conditions in that field.

Q. What do you mean by "field conditions?"

A. That the lives of lines are short because the lives of wells are short. Therefore, there is considerable shifting of lines in that field and considerable obsolescence in pipe lines in the field.

Q. Now, is it a proper method to depreciate a main line on the basis of the rate of depletion of gas in the fields from which it takes gas? Is that a proper method?

A. If a field from which a pipe line takes gas is so depleted that the installation of that pipe line would not be justified, then that pipe line has lost value through obsolescence and, in any estimate of its value, that obsolescence should be given full force and effect.

If the obsolescence has not occurred, it should not be given any effect.

Q. In other words, you begin to switch from the observation method to this so-called depletion method or whatever you want to call it, the minute the gas supply begins to run low, is that correct?

A. No, sir, I do not switch.

[fol. 2727] Q. When do you make the change?

A. I have got a consistent policy in that regard and I try to give effect to the factors that produce depreciation

and when I believe obsolescence has produced depreciation, I give it effect and when I do not think obsolescence has produced depreciation, I do not give it effect.

Q. Well, in your opinion, will the main transmission lines of Panhandle Eastern reach this stage when you will begin to give effect to the obsolescence in the lines?

A. Sure.

Q. Approximately when?

A. I have not estimated the date and I do not read the crystal.

Q. How far depleted, would you say, that the gas field would have to be before you begin to change your method from that of observation to the one which you just described?

A. They would have to be depleted to the extent of when the laying of the lines would not be feasible economic venture on account of the life of the supply.

Q. That is similar to the method employed by you in depreciating wells, is it not?

A. That is correct.

Q. Now, inasmuch as pipe of all kinds which make up the various types of lines represents, by far, the largest [fol. 2728] amount of the property owned by Panhandle Eastern, I would like to examine you a little further with respect to the method used by you in arriving at the observed percents which you deducted for depreciation.

I believe you described that numerous test holes were dug and that four feet of the pipe was uncovered, is that correct?

A. Six feet of pipe was uncovered by the test hole and out of the six feet, four feet was cleaned of its protective coating so that four feet of pipe could be inspected and two feet of the protective coating could be inspected.

Q. And then you made notations with respect to what you saw at each particular point, both as to the coating and as to the pipe itself, did you not?

A. Yes, sir.

Q. Now, what were you particularly interested in with respect to the pipe? Were you looking for general corrosion?

A. I was looking for any kind of corrosion.

Q. You had them in about four or five different classes, did you not? Will you briefly enumerate those again for us so that we can discuss them in connection with this point? Will you proceed with your answer, Mr. Biddison?

A. I made notations as to whether there was no rust, whether there was definite surface rust, whether there was shallow metal attack and if there were measurable pits, [fol. 2729] I recorded the depths of those pits, the deepest pit in each foot of the continuous four feet of pipe that was exposed.

Q. How did you translate those data to percents? If you wish, you might take a typical inspection sheet and cite it as an example.

A. I did not translate any particular inspection sheet to a percentage but I did draw alignment charts to represent sections of this pipe line so that the conditions that had been found, both in my inspection and in the routine reports of inspections by Panhandle Eastern's employees, could be utilized.

Taking the section from Liberal station to Greensburg station—

Q. (Interposing) Which page of your working paper notes are you referring to now?

A. I am referring to a set of charts, a copy of which has been furnished to the engineers of the Federal Power Commission and I am referring to Page 3 of that set of charts.

Q. Thank you.

A. The survey station on this pipe line for Liberal station is Station 5700 plus 00.

Mr. Wheat: How was that now?

The Witness: Station 5700 plus 00 and the station number for Greensburg station is Station 10,348, plus 80. Now, between Liberal station and Greensburg station on Line C-100 I made five inspections on Line C-100.

. . . . . .

[fol. 2731] Q. Just before the recess, Mr. Biddison, you were explaining the method used by you to determine the amount to be deducted for depreciation and you were giv-

ing us that method with respect to that portion of the main transmission line extending from Liberal Station to Greensburg Station.

Will you please proceed with your explanation?

A. On the alignment chart which we have been referring to, that is page 3 of the set of charts, I have indicated by a letter "a", a lower case "a", that at the point where this "a" is located I made an inspection and found no rust.

Where a small letter "b" is located, it indicates that upon that line at that location I made an inspection and found definite surface attack, and where a "c" appears it indicates that at that point I made an inspection and found a shallow metal attack.

Where a solid vertical line appears upon that line on the chart it indicates that I made an inspection and found definite measurable pitting and the height of that vertical line indicates the depth of the pitting in mills, that is, in thousandths of an inch.

A similar code is used on this chart to indicate the results of inspection by employees of Panhandle Eastern Pipe Line Company. Those inspections are indicated by capital letters and the depths of pitting, where pitting was found to exist, is indicated by a broken vertical line.

[fol. 2732] On this chart at Station approximately 6010 plus 00, there appears a capital "A" indicating that the Company's inspection at that point disclosed no rust. Between that point and Liberal Station I also had an inspection with the same result, that is, no rust showing. But at Station approximately 6040 plus 00 my inspection showed pitting to the extent of about 30 mills maximum.

Q. Just a minute. Is that the average of the deepest pits on each of the four foot sections?

A. No, that is the deepest pit.

Q. In the entire exposed portion of the pipe at that point?

A. Yes, sir.

Q. Pardon the interruption. Go right ahead.

A. I have, therefore, classified this section of line from Liberal Station up to the point at which the pitting was observed, as having no rust up to a point half way between the eastward observation of no rust and the first observation of pitting. That is, from Station 5700+00 to station 6,400+00.

Engineers for the Federal Power Commission, I believe, have photostatic copies of the work paper on which I tabulated such a classification.

Q. What percent condition did you put that portion of this line in which extends from Liberal Station to the mid-
[fol. 2733] point that you describe, between the point where no rust was found and the point where pitting was found?

A. 99 per cent.

Q. What is the distance for which you found a 99 percent condition?

A. Well, in this particular stretch that distance is 70,000 feet.

Q. That is approximately 14 miles, isn't it?

A. Yes, sir.

Q. And how many inspection points did you personally view over that stretch?

A. Two—no, over that stretch of 70,000 feet, one.

Q. And then you had the inspections of the Company at another point?

A. Yes, sir.

Q. You were not there when the Company representatives inspected that point, were you?

A. No, sir.

Q. Will you please proceed with your explanation?

A. From the location of the first observation where pitting was discovered, going eastward, that is at Station approximately 6840+00.

Q. Will you please proceed with your explanation?

A. From the location of the first observation where pitting was discovered going eastward, that is at station [fol. 2734] approximately 6840+00, the next eastward observation was at station approximately 6875, and from a point roughly half way between those last two observations or station 6850+00 to midway to the next observa

tion, that is, to station about 7200, I have classed that as no rust.

Q. What was that mid point that you just mentioned?

A. From station 6850 to station 7200.

Q. That is the mid point between what two stations?

A. Well, it is approximately the mid point between station 6840 and station 6870 or 6875.

Q. How did you establish the 7200 as the mid point?

A. Well, I think that was done just by eye to make a guess at a mid point there. It looks like I might have missed it a little bit.

Q. It looks like it is not anywhere near the mid point to me, Mr. Biddison. Will you make the determination of the mid point now?

A. The mid point should be approximately 7037.

Q. How many miles were you off on your original mid point, approximately?

A. About three.

Q. You were in error then three miles on that inspection? A. Yes.

Q. Will you proceed with your explanation, Mr. Biddison?

A. From station 6400 to station 6850 I have shown that [fol. 2735] the latter point for the latter stretch which you described. Would you mind doing that for us?

A. In that stretch where no rust was shown, I have assigned a condition of 99 percent. If definite surface rust was shown, I have assigned a condition of 98 percent. If the conditions shown were that of shallow metal attack, I have assigned a condition of 97 percent, and for those sections in which there was pitting, I have assigned a condition of 95 percent.

Q. Did you assign that 95 percent where there are pits everywhere over the system?

A. Yes, sir.

Q. Without any reference to the depth of the pits?

A. That is correct, because the depth of the pits is generally pretty small, and I think that a 5 percent allowance on all these stretches is ample to cover the amount at close to the maximum depth of pitting.

Q. You found some pits that were half way through the pipe, didn't you, Mr. Biddison, at some points?

A. I think we may have on some lateral lines. We are talking now about main lines.

Q. Yes, we are talking about main lines. Didn't you use the same general method on the lateral lines, however? A. No.

Q. Let's confine ourselves at present to the main lines.

* * * * * * * * *

[fol. 2737] I note that you have some pits that were 100 mills in depth, do you not, between Liberal Station and Greensburg Station on the main line?

A. At two points, yes, sir.

Q. You used 95 percent condition at those two points, did you not?

A. Yes; and I also used 95 percent condition at points where the maximum pitting was 20 mills, 25 mills and 30 mills.

Q. And you used 95 percent condition on other parts of this line, inspection points, where the depth of the pitting was in excess of 100 mills, did you not?

A. No, I didn't specifically do that. I used 95 percent on those sections that were pitted.

Q. Without consideration—

A. (Interposing) Without segregating the shallow pit depth sections from the maximum pit depth sections. I used 5 percent as an average.

Q. How did you arrive at that 95 percent? In other words, how did you arrive at a deduction of 5 percent for depreciation at points where you saw what you call measurable pits?

A. That is my judgment by which the pipe has lost value on the average. It is not a result of a mathematical calculation or algebraic equation.

Q. In other words, you have no working papers to show any basic figures from which this 5 percent depreciation was reached?

[fol. 2738] A. That is my basic figure.

Q. And the same is true, is it not, of your 97 percent which you recorded where you saw a shallow metal attack?

A. That is true, and it is also true of my 98 percent when I found definite surface rust, and also true of my 99 percent when I found no rust.

I simply allowed that even in spite of the fact that you couldn't find anything there, there probably was some little deterioration.

In general those percents are arrived at by making allowance for the fact that there probably is some deterioration that you have not been able to see, just on the law of averages.

Q. You mean it is there but you might have possibly missed seeing it?

A. I mean that it is normal expectancy that there would be something there on a line of that age in those stretches, even if you didn't see it at the particular spot where you made your inspection.

Q. Then, as I understand your method you considered the following factors in arriving at the percents: first, whether or not there was rust; second, the appearance of definite surface rust; third, the shallow metal attack; and fourth, the presence or absence of pits. Is that correct?

A. Measurable pits.

Q. Measurable pits?

[fol. 2739] A. Yes, sir.

Q. My summary is generally correct, is it not?

A. That is correct.

Q. And nothing else?

A. That is right, that is, as to pipe alone. These figures do not relate to the condition of the protective coating.

Q. They relate to the condition of all pipe observed by you?

A. Of all pipe in the main lines.

Q. What do you mean by measurable pit? What is the difference between measurable pit and one that is not a measurable pit?

A. None of this pipe is absolutely smooth, and due to that slight roughness you quite often find a point at which you can detect that there has been some action upon the steel itself, but on account of the pipe roughness you have no way in which you can measure it.

That is generally true when it is less, say, than five mills.

Sometimes you can detect a brightening of the surface that looks a good deal like the result you would obtain by

etching with an acid, that is so slight that you can detect the discoloration of the surface, or you may be able to feel it with your thumb nail, but it is too small to measure with ordinary instruments used for that purpose.

Q. Wouldn't that be called shallow metal attack?
[fol. 2740] A. Yes, sir.

Q. In other words, you then took it out of the category of pitting and put it in the category of shallow metal attack, where the pitting was approximately under two mills?

A. Well, if it were such that you couldn't with any certainty measure it with a measuring device such as we were using, the common device used for that purpose, I called it shallow attack.

With that measuring device you can measure down to five mills and anything under that you can't be sure whether you are measuring pipe roughness or just fooling yourself as to whether or not you are measuring at all.

Q. Did you use a different method than that which you have described, in determining the percent of depreciation to be deducted for the "trunk gathering line", to use your term, in describing that portion of the line running from Windmill Junction to Liberal Station?

A. No, sir, I used the same method.

Q. Now, how about the gathering lines? Did you use the same method for those? A. No, sir, I did not.

Q. Will you describe the method you used to determine the percent of depreciation for those lines? Let me ask you this while you are seaching through your papers:

Whether you used the same method on field lines and [fol. 2741] gathering lines.

A. No, sir, I used that method only on the main lines.

Q. But my question is: Did you use a different method on both gathering lines and well lines?

A. Yes, I used a different method. I did not use the same method.

Q. But it was the same method for the latter two?

A. In general, a determination on gathering lines was made for gathering lines and the results then used for well lines.

Q. All right. Now, will you please explain the method used for gathering lines and the well lines?

A The gathering lines in the Texas field, using both my own observations and those shown in the company's reports, I had twelve observations at which no rust were shown, I had four at which there was definite surface rust, and I had six at which there was shallow metal attack, and I had five at which there was pitting.

Now, assigning to the condition of no rust a value of 98 percent, to the condition where there was surface rust a value of 97 percent, to the condition where there was shallow metal attach a value of 95 per cent, and to the condition where there was actual pitting a value of 90, I arrive at a weighted figure of 95.77 for pipe in those lines, and I used a condition of 95 percent even.

Q. Now, Mr. Biddison, I notice you have changed your [fol. 2742] percents for similarly described conditions.

Now, on the field lines or, rather, on the gathering lines, you ascribe a percentage of 98 where there was no rust, whereas on the main lines you used a percentage of 99 where there was no rust. Why the difference?

A. It was just simply that in my judgment there is more apt to be more deterioration in those lines in the field under those conditions than on the main lines.

Q. What would be the cause for that?

A. Well, the cause for that would be that the lines in the field do not have as good a protective coating, did not have originally, and have not held up as well.

I am simply allowing in that estimate for the conditions that I can foresee that would affect those values.

Q. What kind of coating did the gathering lines have?

A. A great many of those are coated with a cold paint, whereas the main lines are, in general, coated with a hot application.

Q. What is the name of that paint?

A. Ace paint, I believe it is.

Q. Wasn't that paint, namely, Ace paint, used on the main lines?

A. No, that is very largely a bitumastic coating applied hot.

Q. Now, when you found pitting on the gathering lines, [fol. 2743] you put those lines in 90 percent condition, whereas when you found pitting on the main lines, you put them in 95 percent condition. Why the difference?

A. Because I think those conditions represent more depreciation on those lines than they do on the main lines.

Q. Those same conditions? A. Yes, sir.

Q. Can you give us any further reason than the mere repetition of your conclusion? What is the basis for your conclusion?

A. I think that in the field lines that because of the general condition of the protective coating, there is very likely an amount of depreciation on the pipe itself by virtue of attack on the pipe itself, than is represented by the observations, and I simply allowed for it.

Q. You didn't see any more depreciation at a point on a field line where you used a 90 percent condition, than you did at a point on a main line to which you ascribed a 95 percent condition, did you?

A. No, but I allowed for that, which I think represents the facts.

Q. The unobserved facts?

A. Yes, sir. It was my opinion that they had suffered that much depreciation and so I set it down at those figures.

[fol. 2744] Q. Even though you didn't see it?

A. Yes, sir.

Q. You didn't make any allowance for any depreciation which you did not see on the main lines, did you?

A. I certainly did. I took off one percent on those main lines where there wasn't a sign of rust, just for that very reason.

Q. And you took off two percent on the gathering lines where the same condition exists?

A. That is right.

Q. Are these percentages related to 100 percent? By that, I mean when you find a field line in 90 condition that means it is 90 percent of 100 percent, does it not?

A. That is what percentage means.

Q. And 100 percent means what?

A. It means perfect condition, that it has suffered no loss in value.

Q. So far as you can see.

A. It means that it has suffered no loss in value if it is 100 percent condition.

Q. So far as you can see?

A. See or not see it. If it is 100 percent condition it has suffered no loss in value.

Q. Now, 90 percent condition is related, is it not, to a zero point, or is it? A. Yes.

[fol. 2745] Q. When is zero point reached?

A. When all value is lost.

Q. And when does that come about?

A. That comes about when you can't use the article for the purpose for which it is intended.

Q. You mean, it is the point at which the pipe line will not carry gas?

A. No longer serve to carry gas. That is correct.

Q. And this pipe may possibly be removed, may it not, and retired from service, before that point is reached?

A. Yes.

Q. Then, your zero percent condition has no relation whatever to the abandonment of the pipe by reason of the alleged exhaustion of the gas supply, before it has reached the physical stage at which it will carry no gas?

A. Certainly not.

Q. How much pitting is necessary to put a pipe in zero percent condition under your theory?

A. It depends upon the pattern of the pitting.

Q. Will you give us an example?

A. If there be scattered individual pits, that is, pits not connected with each other, and which perforate the pipe walls to the extent that it is more economical to remove the pipe than to patch up the pits, then I think that pipe has reached zero value.

[fol. 2746] If, on the other hand, the corrosion pattern is one of scaling off on comparatively large areas, the pipe may reach zero value when this erosion has penetrated less than half way through the pipe walls because under those conditions the pipe walls may be so weakened that the pipe would no longer withstand the stresses to which it was intended to be put.

So, as I say, it depends upon the pattern of the attack upon the pipe how far that must go before all value is destroyed.

Q. What zero point did you have in mind?

A. Any zero point that brings the pipe into condition where it is of zero value, that is, not suitable for use any longer for such gas transmission, no matter what brought it about.

Q. Now, if you found at an inspection point that the deepest pit was as much as 75 percent through the pipe wall, what percent condition would you put that pipe in?

A. That would depend entirely upon the pattern of that pitting as to whether or not there were many other pits in that vicinity, whether this was a pit of small diameter or a large patch.

Q. You can conceive of a situation then, I take it, under those circumstances, where a pit at a point is as much as three-quarters of the way through a pipe wall, and it could still be in 90 percent condition?

A. Yes, I can conceive of where you could have a hole [fol. 27474] clear through it and still be in 90 percent condition if it is one of those pits that you could go in there and quite readily patch up.

On the other hand, I can conceive also of a pitting pattern, and I have seen many of them, that have not gone halfway through the pipe walls and yet the pipe was in substantially zero condition.

Q. You didn't take into account, did you, Mr. Biddison, the pattern of the pitting in the method you described for either the main lines or the gathering lines?

A. Yes, sir.

Q. I thought you said, wherever you found pitting on the field lines, you used 90 percent and on the main lines you used 95 percent. Is that correct? A. That is right.

Q. Will the pattern that you speak of ever affect those percentages?

A. They were generally the one pattern, that is, isolated, scattered pits. We did not have any of that pattern where such areas were eroded away so as to have any measurable effect on pipe wall strength. That would have been a different proposition, had we seen those.

Trial Examiner: We will recess until 2 o'clock.

(Whereupon, at 12:35 p. m. the hearing in the above entitled matter was recessed until 2:00 o'clock p. m. of the same day.)

. . . . . .

[fol. 2748] By Mr. Littman:

Q. Mr. Biddison, you have made a great many pipe inspections on natural gas lines, have you not? A. Yes, sir.

Q. Throughout your experience? A. Yes, sir.

Q. Have you, at any time, ever seen such pipe at any time at such inspection point which was in zero percent condition? A. Yes.

Q. Will you describe such pipe at one or two of those inspection points, what did it look like?

A. I cannot sit down and describe today a particular piece of pipe. I can only say, in general, that it looked like it was not worth anything, that it ought to be out and not in service.

Q. Can't you be a little more specific than that? Don't you have some recollection of the appearance of the pipe? [fol. 2749] A. Well, I have seen some pipe in the last sixty days that was in zero percent condition.

Q. At an inspection point?

A. Yes.

Q. Then that is recent enough for you to have a fairly vivid recollection of the situation. Can't you describe that particular pipe?

A. Well, I have seen more than one. I do not know whether I can pick out a particular one or not but I have seen pipe that was down close to that percent condition in the last sixty days.

That pipe was, generally, heavily pitted and had a number of leak clamps on it.

Q. About how many leak clamps?

A. I do not know.

Q. What was the diameter of the pipe that you are speaking of, approximately?

A. I think one was 16 and another 18 that I found in zero percent condition. That is my recollection.

Q. And what was the approximate thickness of that pipe?

A. Well, I think the 16-inch was either a quarter or 5/16, I am not certain which; and the 18-inch, I believe

that was 5/16, that is my recollection of about what the thickness was of that pipe.

Q. How much of that pipe was uncovered at the inspection point?

[fol. 2750] A. On the 16-inch, we had six feet uncovered. On the 18-inch, at one inspection hole, we had six feet uncovered and at points close to there, there were half joints uncovered that could be seen.

Q. Was the pipe leaking gas at the time?

A. No.

Q. How many leak clamps were observed in the six-foot section that was uncovered on the one?

A. I do not remember.

Q. Was there more than one?

A. Yes.

Q. Was it pretty heavily pitted?

A. Yes, very badly pitted.

Q. But there were not any holes other than those which might have been under the leak clamp?

A. That is right. There were some almost through.

Q. Do you know what kind of soil was observed at that point?

A. No, I do not. I do recall that, on the 16-inch pipe, it was in a swale. There was a low spot where the drainage was comparatively poor but I do not remember what the soil characteristics were.

I feel sure that it was not in the black waxy belt but just what the soil was I do not recall.

[fol. 2751] Q. Have you ever seen pipe in a natural gas system at an inspection point which was in zero percent condition and which did not have any leak clamps on it?

A. Yes.

Q. What caused you to put that pipe in zero percent condition?

A. Because the corrosion had been so heavy the pipe walls were so thin that I thought it was unsafe for use and ought to be discarded.

Q. How thin? A. I do not remember.

Q. Well, it was quite thin, practically gone, wasn't it?

A. Well, thin enough that I thought it was unsafe for use. I do not know how thin that was now because I have nothing before me about it. That is just one of the things

that have occurred in a long experience, occurred many times.

Q. Now, I believe you stated that you used a different method to determine the depreciation to be deducted for the lateral lines than that which was used for the main lines and the field lines and well lines.

Will you describe the method used on the lateral lines?

A. For the lateral lines in Kansas, I have taken the reports on pitting and paint condition of Panhandle Eastern Pipe Line Company and I have classified them as to [fol. 2752] whether there was no rust, whether there was definite surface rust or shallow metal attack or pitting.

On those laterals, 9 observations out of 14 showed no rust; 5 out of 14 showed definite surface rust. Weighing those observations produces 97 percent. I have, therefore, deducted 3 percent from those laterals.

Q. Have you completed your answer, Mr. Biddison?

A. Yes.

Q. Do I understand that you personally made no inspections on any of the lateral lines in Kansas?

A. That is correct.

Q. You utilized certain inspections made by company employees?

A. Yes, sir, on which there are routine inspection reports.

Q. Didn't they find any pits anywhere on this line?

A. There are none reported on the observations in Kansas.

Q. Does that mean that there were not any or does that mean that they did not record any, whether they saw them or not?

A. That means that none showed up at the points where they made the inspection.

Q. Mr. Biddison, do you know anything about the lateral line which runs from the main line in Kansas for a distance of approximately 32 miles down to Mildred, Kansas, called the Mildred lateral?

A. I know of such a line, yes.

[fol. 2753] Q. You have never seen it?

A. I have seen a little bit of pipe out of it.

Q. Isn't it a fact that that lateral is one which was the subject of a proceeding before the Federal Power Commission in an abandonment proceeding?

A. I so understand.

Q. Do you know what is being done with that line at present?

A. I understand it is being taken up and relayed some place in Illinois.

Q. Do you know how much money is being spent by Panhandle Eastern to recondition that pipe?

A. I do not think any is being spent to recondition it. I understand the line is being taken up and relayed.

Q. It is your understanding that that pipe is not going to be reconditioned prior to relaying?

A. I understand that it will be cleaned up prior to relaying but that is not what is generally referred to as a reconditioning job.

It is being put in shape for relaying. There is a little distinction there between reconditioning for use in its location and reconditioning for use in another location. It is not being reconditioned because it was in bad shape at all. It is simply being put in the best condition it can be put in for the new location.

[fol. 2754] Q. Do you know whether or not Panhandle Eastern expects to weld the pits on that pipe?

A. No, I do not know whether there are any on it or not.

Q. If Mr. Burnham, who is the company's Chief Engineer, testified that the Mildred lateral line was in 10 percent condition—I beg your pardon, in 90 percent condition or 10 percent depreciated as he did in a proceeding before this Commission in which the company requested the abandonment of that line, would you say that he was in error?

A. I do not think he so testified. That is not my understanding but I do not think that I am in a position to argue with him about a matter that is his own judgment.

Q. You do not know what he testified to in that regard, do you? A. I do not. I was not there.

Q. Obviously, if he testified that this line was in 90 percent condition and you testified that it is in 95, both of you could not be right, could you?

A. I have not testified it is in 95 percent condition.

Mr. Wheat: Mr. Littman, you said 10 percent and prior you said 90 percent.

Mr. Littman: I corrected that to 90 percent condition or 10 percent depreciation. I corrected that.

Mr. Wheat: I see.

By Mr. Littman:

[fol. 2755] Q. Now, that is the method by which you determine the percent condition of the lateral lines in Kansas. Did you inspect any of the lateral lines in Missouri?

A. Yes.

Q. Before proceeding to the question of the lateral lines in Missouri, did I understand you to say that you did not put the lateral line, called the Mildred lateral, in Kansas, in 95 percent condition?

A. I did not assign a specific condition to any single lateral line in the State of Kansas. I deducted 5 percent of the value from the lateral lines in Kansas as a whole group.

Q. Over what period of time were these inspections made on the lateral lines in Kansas to which you alluded a few minutes ago?

A. They are the inspection reports for the year 1940 and '41, mostly in '41 is my recollection now.

Q. Assuming that the Mildred lateral line is to be taken up from its location running from the main line down to Mildred, Kansas, and removed to Illinois, wouldn't that pipe be considered by you to have been fully depreciated?

A. I do not know what you mean by "fully depreciated." You mean depreciated down to zero?

Q. Yes, depreciated down to zero and retired from the service of Panhandle Eastern Pipe Line Company.

A. Certainly not. We depreciated it down to not less [fol. 2756] than recovery value at that time. If it had been known that it were going to be moved—

Q. (Interposing) What about the labor cost of installing that line? What happens to that?

A. It is lost when you remove it.

Q. It certainly is in zero percent condition, is it not, under those circumstances?

A. If it is known, if that fact be known. It was not known at the time I made the inspection.

Q. Well, when did you make the inspection? You did not make any inspection on this line, Mr. Biddison, did you?

A. I made the inspection on the system and that is the inspection I am talking about. I previously stated I did not inspect that particular line.

Q. Well, assuming the fact is that this line, this Mildred lateral, is now being taken up and sent over into Illinois for use in Illinois, what would you say with respect to the labor cost of installing that line in Kansas? Is it or is it not in zero percent condition?

A. It is gone now, certainly.

Q. Is it in zero percent condition? A. Yes.

Q. If you had known that situation when you made this inspection, would you have put that labor cost of installation in zero percent condition?

[fol. 2757] A. I would have depreciated the whole line down to its recovery value. That is exactly what I would have done.

Q. Now, we were discussing the Missouri lateral lines and I believe you stated you made some inspections on those laterals. Will you give us the number, please?

A. I made one.

Q. There are approximately 266 miles of laterals in Missouri, are there not, as shown in Schedule 11 of Exhibit 17?

A. If I can refer to Exhibit 17, maybe I can answer your question. This schedule shows there to be 266.77 miles of lateral lines in Missouri.

Q. Well, did you base your percent condition of the Missouri lateral lines on that one inspection that you made? A. I did not.

Q. What did you base it on?

A. I based it upon the routine inspection reports made by Panhandle Eastern Pipe Line Company's employees which, on the Tipton lateral, showed pitting at three locations and, at one location, showed shallow metal attack and which, on the Fayetteville lateral, one report showed pitting to the extent of 15 mills and, on the Jefferson City lateral, showed no rust at four locations and showed definite surface rust at one location.

Q. One man's opinion of what is definite surface rust and what is not might or might not coincide, is that correct?

[fol. 2758] Mr. Wheat: Coincide with what?

Mr. Littman: The two men's opinion.

Mr. Wheat: You said one man's opinion might not coincide—

Mr. Littman: (Interposing) Coincide with the opinion of another. I am sorry I did not complete the question.

The Witness: Well, I suppose there would be times when there might be a little divergence of opinion on that, yes.

By Mr. Littman:

Q. And the same is true of the other factors that you have named here from time to time, which you ordinarily take into account in determining your percent of depreciation, is that correct?

A. I suppose there is room for a little bit of difference of opinion but, among competent observers, that difference would very seldom arise.

Q. Who were the men that made these inspections on behalf of the Company?

A. The Division Superintendents in each section.

Q. Did they receive their instructions from you with rsepect to the observations at these inspection points?

A. They did not.

Q. But it was upon these inspection points, with one exception, that you relied in determining your percent condition for the lateral lines in Missouri, is that correct?

A. That is correct.

[fol. 2759] Q. Are there any lateral lines in Missouri that nobody inspected?

A. Yes.

Q. Will you name those lateral lines in Missouri upon which you had no inspection data?

A. If I have access to a map.

Q. I believe Exhibit 15 is pinned on the wall and I believe that it shows the lateral lines.

A. There is a small tap to Centerview, a short tap to Houstonia and a short tap to Pilot Grove.

Q. Could you give us the approximate distances from the legend on the map? We won't hold you to exact distances, Mr. Biddison, but I would like to have an idea about what you mean by "A short tap."

A. There is no scale shown on this map. I have to make a pretty long guess at this but those taps—

Mr. Wheat: (Interposing) Do you want to change that answer, Mr. Biddison, as far as the scale on the map is concerned?

The Witness: (Continuing) Those taps that I referred to are pretty short. I have found a scale on the map and the Centerview tap shows it to be about 2½ miles; the Houstonia tap about 4 miles; the New Franklin tap about 2 miles; the Columbia tap about 10 or 11 miles; the Moberly tap about 20 miles with a branch off of it of about 5 miles.

The Centralia tap is about 4 miles and the Fulton tap [fol. 2760] about 20 miles; Boonville tap about 4 miles. The Wellsville tap is about 15 miles. There are two or three other small sized taps of a couple of miles or so, the Bowling Green tap is about 5 miles.

By Mr. Littman:

Q. How about the Windsor tap running south from a point just west of Houstonia station? Were any inspections made on that lateral?

A. No, sir.

Q. How long is that lateral, approximately?

A. About 10 miles.

Q. Now, Mr. Biddison, how did you arrive at the percent of depreciation for these lateral lines which you just named and on which neither you nor the company made any observations?

A. On the Tipton lateral, it is my estimate that there has been a loss of 30 percent in value. Therefore, I deducted from the value of the Tipton lateral 30 percent. On the—

Q. (Interposing) Pardon me, would you mind explaining how you arrived at that 30 percent before proceeding to the next lateral?

A. That is my judgment as to the amount of value that has been lost by virtue of the fact that, in four of the lo-

cations, there has been considerable pitting and, at one location, it is a shallow metal attack.

Q. Now, that Tipton lateral is one that you had some [fol. 2761] inspection data on that was made by the company?

A. Yes, sir.

Q. I see. Proceed with your explanation, Mr. Biddison.

A. On the observations on the Fayette lateral and Jefferson City lateral, they being the company's inspections, since there was pitting only at one location out of 7 inspections, I estimate that there has been a loss in value of 5 percent on the pipe and I have, therefore, deducted 5 percent from the value for all the pipe and equipment in the lateral lines in the State of Missouri exclusive of the Tipton lateral.

. . . . . .

By Mr. Littman:

Q. You did not accord any weight to the observations on the Tipton lateral then, did you?

A. Yes, I applied the observations on the Tipton lateral to the Tipton lateral.

Q. That lateral was found to be 30 percent depreciated, was it not?

A. That is my estimate of it, yes, sir.

Q. The other two laterals which you named, namely, Fayette and Jefferson City, on those you found approxi- [fol. 2762] mately 5 percent depreciation, did you not?

A. I did not find that from the observations but I used 5 percent for the Fayette lateral, the Jefferson City lateral and the other laterals in the State of Missouri.

Q. Why?

A. To allow for the loss in value which had occurred on them.

Q. How did you know 5 percent loss had occurred on them, Mr. Biddison?

A. That is my estimate on what had occurred, based on the information which I have recited.

Q. Let me get at it this way: There were observations made by the company representatives of the Tipton lateral, is that correct?

A. Yes, sir.

Q. And were there observations made on the Fayette lateral?

A. Yes.

Q. And were there observations made on the Jefferson lateral?

A. Yes.

Q. And those three laterals were the only three upon which any observations had been made, is that correct?

A. I think that is right, yes, sir. Those are the only ones I find of record.

[fol. 2763) Q. Now, the Tipton lateral was found to be 30 percent depreciated, is that correct?

A. That is my estimate of the depreciation that has occurred in its based upon the information.

Q. At the inspection points on the Tipton lateral?

A. Yes, sir.

Q. And the percent of depreciation ascribed by you to the Fayette and Jefferson laterals was 5 percent, is that correct?

A. Based upon the observations there, I estimate there has been 5 percent depreciation occur in the other lateral lines in the State of Missouri, exclusive of the Tipton lateral. These other lateral lines include the Fayette lateral, the Jefferson City lateral, and the conclusion I have reached is based upon the inspections on the Fayette lateral and the Jefferson City lateral.

Q. Without giving any weight or effect to the inspections made on the Tipton lateral, is that correct?

A. That is correct.

Q. Now, will you tell me, Mr. Biddison, how you can arrive at a conclusion that a lateral, such as the Moberly lateral and its stub totaling 25 miles in length was in 95 percent condition without having made any observations on that lateral and without having before you anybody else's observations on that lateral?

[fol. 2764] A. I have not said that that lateral was in 95 percent condition nor that it had suffered 5 percent depreciation. I have said that, based upon the data which is available to me on the Fayette lateral and the Jefferson City lateral, that I estimate there has been a loss in value of 5 percent on the lateral lines in the State of Missouri, exclusive of the Tipton lateral.

Q. Well now, how much is being deducted from book cost in your Exhibit 69 for the Moberly lateral?

A. I have not made any segregation of the Moberly lateral in that respect.

Q. Well, it certainly would be 5 percent, wouldn't it? It would have to be, wouldn't it?

A. I have not made any deduction on the Moberly lateral, as such. I have made a deduction on a group of laterals as an over-all figure for the group.

Q. None of which exceeds 5 percent depreciation?

A. It is 5 percent on the group. I have not segregated the group and applied individual figures to them.

Q. The group that you speak of is the group on which you did not ever make any observations and is the group on which neither the company's representatives nor anybody else, so far as you know, ever made any observations, is that correct?

The Witness: Will you read me that question again?

(Whereupon, the pending question, as recorded, was [fol. 2765] read by the reporter.)

By Mr. Littman:

Q. When I speak of "group", I mean the group exclusive of Tipton, Fayette and Jefferson laterals.

A. No, the group includes the Jefferson and Fayette laterals. The group includes all lateral lines in Missouri exclusive of Tipton lateral.

Q. Well, Mr. Biddison, do you think that the data that you had on the Tipton, Fayette and Jefferson lateral was sufficient data upon which to predicate a true and correct percent condition on the other lateral lines in the State of Missouri?

A. Of course, it is not as good as if you had twice as much information but it is enough upon which to draw a rational conclusion.

Q. Why didn't you weight into your judgment the findings on the Tipton lateral?

A. Because my information that I secured upon inquiry indicated that on this line, conditions were particularly severe and the information obtained upon the inspection of the main line running clear across the State did not indicate that such conditions were at all general in the State.

Q. Well, you certainly used two laterals, namely, the Fayette and Jefferson laterals which showed the lowest percent of depreciation and applied that to the remaining laterals in Missouri which you did not observe?

[fol. 2766] A. I used the only other two available. If there had been ten others available, I would have used them.

Q. Why were the conditions on the Tipton lateral so extraordinary as not to be usable as data?

A. I do not know. All I know is that the conditions indicated by the reports show them to be unusable.

Q. Now, did you make any inspections on any of the laterals in Illinois? A. Yes, sir.

Q. How many inspections did you make? A. Five.

Q. Were there any lateral lines in Illinois upon which neither you nor company representatives made any inspection? A. Yes.

Q. Will you name those, please, and give the approximate mileages from Mr. Burnham's map No. 15?

A. Roodhouse lateral, about 5 miles; Jacksonville lateral, about 10 miles. There may be, in addition, some branches of laterals on which there were no inspections. I cannot determine that without an analysis of the inspection reports on the alignment map.

Q. Now, there were a number of river crossings, were there not, on the lateral lines in the States of Missouri and Illinois?

A. Yes, there are some river crossings on some of [fol. 2767] those laterals.

Q. For instance, there is in Illinois the San Gamon river crossing and the Illinois River crossing, is there not?

A. Yes, and the Mackinaw River and Salt Creek.

Q. You did not make any detailed inspections on any of those river crossings, did you, Mr. Biddison?

A. No, sir, I did not.

Q. In Missouri, there is the Salt River and Turkey Creek crossings, is there not? A. Yes, sir.

Q. The Mississippi River crossing and the Missouri River crossing, is that correct? A. Yes.

Q. Did you make any inspections on those river crossings, Mr. Biddison? A. No, sir.

Q. Now, speaking of inspection points, generally, at which you personally were present, Mr. Biddison, who

selected the various inspection points over the pipe line system? I am now speaking of all of the lines that were inspected?

A. I did.

Q. Will you describe, generally, the method pursued by you in selecting these inspection points?

A. Well, the method was to roughly secure a fairly uniform distribution of observations over the pipe line [fol. 2768] system and restrict the observations mostly to the larger lines.

Q. May I interrupt to ask, Mr. Biddison, who determined the number of inspection points? A. I did.

Q. What was the basis of the number selected? Was it based upon the amount of pipe or what? What governed that situation?

A. Well, the thing that governed was my judgment of the number of inspections that would be requisite to make a rational determination of the condition of those mains.

Q. And by mains here, you are talking about the entire pipe line?

A. That is right. I had it in mind as to well lines, that observations upon the larger gathering lines would give a comprehensive picture of the situation that existed upon pipe lines in either of the producing fields and that, therefore, it would not be necessary to make inspections on the smaller well lines, that their condition would be in accord, generally, with the condition found upon gathering lines.

As to the Local Area around Kansas City, it was my idea that it was not advisable to use time inspecting that pipe when it was required that we be prepared for this hearing by a specified day which did not allow much time for preparation and that their value could be predicated upon the prospects of future life if they had not already suffered obsolescence.

[fol. 2769] Q. May I interrupt to ask, did you use the company's soil survey in locating the inspection points?

A. I did not.

Q. You knew there was such a survey, did you not?

A. I knew some soil survey work has been done.

[fol. 2770] Q. Now, did you use a map to assist in the selection of the inspection points?

A. Yes, sir. I did.

Q. And did you spot the inspection points on the map over the lines?

A. Yes, sir. I made approximate locations upon a system map and I discussed the number of locations and their approximate location with representatives of the Federal Power Commission prior to making the final and definite locations.

That was done with the view that those representatives might themselves wish to make some locations and in the final analysis, I, myself, made all the locations and using this system map as a guide, the locations were marked off upon alignment sheets so as nearly as possible, to obtain locations that would be convenient of access by automobile.

Q. How did you determine the spacing between inspection points on the lines?

A. I first examined the total number of holes and then gave them a fairly uniform distribution along the lines.

I originally had about 60 test holes upon the main lines, and I subsequently added about 31 more.

Q. You didn't select these points on the basis of, for example, one inspection point for every so many dollars [fol. 2771] of pipe, did you?

A. No, sir. I did not.

Q. It was kind of a random selection, was it?

A. I don't know whether you would call it random or not. It was a selection made in just the fashion I stated. I selected a number of holes and then gave them a fairly uniform distribution over the main line system.

Q. At points that were easily accessible by automobile?

A. Well, at points that we thought would prove to be fairly ready of access.

Q. Now, were those holes dug at precisely the point or points designated by you on this map?

A. No, there were a few instances where the locations were moved a little bit.

Q. What were your instructions with respect to the exact point at which the inspection holes should be dug?

A. If this proved to be a point where it would be of considerable inconvenience to the land-owner, or a location where there were obstacles to digging, or where it was solid rock so that the digging of the hole would be unduly expensive, the field superintendent had freedom of action to move the location.

Q. How far could he move it one way or the other?

[fol. 2772] A. I didn't set any limit on it.

Q. And he did move some of those inspection points, did he not?

A. Yes.

Q. Your inspection point was designated on the map close to a road in each instance, was it not?

A. I picked locations on the map which were close to what were designated as roads on the map.

Q. And you left the matter of the precise location in the hands of the superintendent?

A. I gave the station location for the hole and gave instructions which I have already recited, but if, as a matter of practicability, the location was one where the digging of a hole would be unduly expensive, or would cause a property owner undue inconvenience, it would be satisfactory to move the location.

Q. Now, Mr. Biddison, you mentioned something a moment ago about representatives of the Federal Power Commission in connection with these inspection points. Did any representatives of the Federal Power Commission select any inspection points?

A. No, sir. They refused to do so on the final analysis.

Q. So that the selection of the points was entirely yours and that of the superintendent?

[fol. 2773] A. The selection of the point was entirely mine, as I have previously explained two or three times.

* * * * * * * *

Q. Mr. Biddison, I believe you testified that the inspections which you made for the purpose of this proceeding were the same as that which would be required to determine the value and condition of the property for the purpose of purchase or sale, is that correct?

A. Yes, sir.

Q. Does your percent condition represent the proportion of the pipe lines which a prospective purchaser would expect to receive for his money?

Mr. Culton: May I have that question read, again?

(Thereupon, the last question was repeated as recorded by the reporter.)

By Mr. Littman:

Q. Expressed in percent of condition new, if that will help clear it up.

A. Well, it might or it might not, depending upon the condition of sale.

Q. Well, then, what do you mean when you say that the inspections which you made for the purposes of this proceeding, were the same as those which would be required [fol. 2774] to determine the value or condition of the property for the purpose of purchase or sale?

A. Well, if a purchase or sale is to be made, there is usually some bargaining about it. But the matter of what the value is is always a matter for consideration, and it is this value that I sought to determine by use of the results of my inspection and other factors.

Q. Well, does your percent condition then represent the percentage of the value of the pipelines which a prospective purchaser would expect to pay?

A. I think what a prospective purchaser would pay is a matter of bargaining, but the value is a guide to him in making his negotiations.

Q. And this percentage would be your recommendation to a prospective purchaser in that connection, would it not, if you were representing the prospective purchaser?

* * * * * * * * *

The Witness: The percentage which I have deducted is the percentage which I would tell a prospective purchaser if I were working for him, or a prospective seller if I were working for him, by which the property had lost value.

By Mr. Littman:

[fol. 2775] Q. Now, what is the purpose for which a purchaser would use this property?

A. In making up his mind what price he could afford to pay for it.

Q. Perhaps you misunderstood my question, Mr. Biddison.

To what use would you expect a purchaser of this property to put this property of Panhandle Eastern's system? What would a prospective purchaser be expected to use this property for?

A. The only purpose I know to use it for would be to transmit, produce and sell natural gas. That is what it is designed for and used for and usable for.

Q. And what you have said, of course, is true of the pipe line, isn't it?

A. It is useful for the transportation of the gas; yes, sir.

* * * * * * *

Q. Now, don't you think that under those circumstances, a purchaser of this property would take into consideration in the fixing of the price that he was to pay for this property, the length of time that this line will remain useful for the purpose of carrying gas?

A. Yes, I feel right sure he would.

Q. And would he make some deduction from cost new [fol. 2776] by reason of the claimed depletion of the gas supply?

A. No, I think not. On the contrary, I think he would pay a handsome bonus for the fact that the thing is finished; operating, the plant is proven and tested, operating efficiently, the market is developed, and the concern has a history of business and success rather than a prospect.

Q. And suppose this purchaser were contemplating buying this property in 1964, one year before, according to your claim, the gas supply would be exhausted.

Would he then deduct anything by reason of the fact that practically all of the gas supply has been exhausted?

A. I feel sure he would.

Q. Certainly. And he would make a deduction in his own mind a good deal sooner than 1964, would he not, by reason of the claimed exhaustion of the gas supply?

A. I think probably he would.

Q. Have you made any deduction from your value or book cost by reason of that element, Mr. Biddison?

A. No, because that element is not operative as to value on this property and will not be operative on this property until after such time as, due to the failure of gas supplies, the construction of the system would not be an economic venture.

Q. But it is operative right now, as far as you are concerned, in fixing an annual allowance for amortization, is it not?

[fol. 2777] A. Certainly. We have to accrue for a great many things that we know will happen, things which do not cause loss in value until they occur, but the certainty that they are going to occur requires that we accrue for them in advance.

Mr. Lee: May I ask a question?

Then what happens to those accruals predicated upon the time you have fixed, if the occurrence does not take place and you continue in business?

The Witness: If the occurrence doesn't take place, that is just a pice of good luck.

Mr. Lee: It is a piece of poor luck for the consumer in the meantime, isn't it?

The Witness: That may be. On the contrary, it is a piece of bad luck for the owners of the property if those things occur and they have not accrued for them. So the best one can do is to exercise an intelligent judgment in taking care of the things which experience has shown us do occur in such a business.

. . . . . .

[fol. 2783] By Mr. Littman:

Q. You said a minute ago, Mr. Biddison, that a prediction had to be made about the abandonment date of this property. You have not made any prediction yourself, have you?

A. I have taken the abandonment date predicated as coincident with the time when gas production from these [fol. 2784] fields will not be profitable.

Q. That is simply a way of saying that you made an interpretation of the statement submitted by Mr. Ralph

E. Davis and based upon that interpretation you arrived at your abandonment date in 1965.

Isn't that all it amounts to?

A. That is substantially it and I have so explained it several times.

Q. So that it is not your prediction, but if it is anybody's prediction it is Mr. Davis'. Is that correct?

A. That is a result of his written statement and I have used the period through which he predicts sufficient supplies, or substantially that period, as a period by the end of which amortization of the property should be complete.

Q. And Mr. Davis didn't make any prediction about this property being abandoned in 1965 either, did he, Mr. Biddison?

A. No.

Q. Now, before leaving the subject of transmission lines and other lines included within the meaning of that term, I believe you testified this morning that where you found pitting at inspection points on that part of the main transmission line leading and extending from Liberal station to Greensburg station, you used a factor of 95-percent condition and, that when you came to the gathering lines and found pitting of the same type and sort, you classed those lines as in 90 percent condition.

[fol. 2785] Is that substantially your testimony?

A. That is what I did do and that is what I said I did.

Q. Now, you gave as the reason for that the fact that the gathering lines were covered with Ace paint which is a cold application, whereas the transmission lines were covered with a hot application of paint.

Is that a correct statement of your testimony?

A. There are exceptions to that, but that is a rather general situation. In the field they have used a lot of that Ace paint.

Q. Are there any other reasons why you went from 95 to 90 percent on the field lines and gathering lines?

A. Yes, as I explained this morning and as I will try to do again, because the field lines are not as well protected as are the main transmission lines, and because of the field conditions in general as affecting pipe, I have made an

additional allowance on field lines for depreciation above those that I allowed on the main lines for the same viewed conditions as a matter of judgment.

Q. What are these field conditions in general that you speak of? I think I understand what you mean when you talk about paint, but the field conditions in general is something I do not understand.

A. In general, on field lines you have the opportunity for some of these small but rather intensively corrosive [fol. 2786] spots due to the blowing of drips and items of that sort.

Q. Don't you have drips on the main lines?

A. Yes, you have drips on the main lines but you do not have the liquid in those main lines as you would in the field lines.

Q. You would not have much in his line. This is the line closest to Liberal station where the gas is dehydrated.

A. You don't have much in any of the lines because the gas is dehydrated before it goes to the main lines. But you do have it in your field lines.

Q. That is a matter of corrosion, isn't it?

A. No, sir, it is not. As I was explaining, the drips from the field lines produce conditions around the lines which produce concentration of action on the pipe and, numerous elements of that sort affect field lines that you don't have on the main lines.

Further than that, you have exposed fittings on field lines that are subject to damage from stock and conveyances that get around over the producing areas, and it is for those things that I made an additional allowance from what I would have made had I seen the same conditions on the pipe on the main line system.

Q. Was that by the observation method?

A. You can call it any name you want to. I am trying to explain to you what I did and why I did it.

Q. You didn't see any effects of what you just de- [fol. 2787] scribed, did you, on these lines?

A. Yes, certainly I did.

Q. As reflected at your observation points?

A. My observations were on lines which I have classed as gathering lines and for them I have made a determination of condition and given that condition to include the well lines.

Q. All right. Now, tell us at what inspection points did you observe the effect of drips that you explained a minute ago?

A. I don't know, but I do know that I saw drips and saw the accumulation of stuff that you find around drips in proximity to pipe lines. And I know it is common to find that in fields, and you find it in the Hugoton field and in the Panhandle Field. It is in every field that I have ever been in.

Q. You didn't see the effect of it on the bare pipe, the exposed pipe, at an inspection point, did you?

A. If I did, I don't know. If I did I have not made a notation of it to that particular effect, that I now recall, at least.

Q. At any rate, one of the major reasons for the difference between the 90 and 95 percent condition which you have described, was due to the difference in the protective coating?

A. Due to what I consider to be the effects of that difference in coating. The major element is just my judgment, but I think as a matter of common sense, one can [fol. 2788] expect a greater loss in value on lines of that sort than you would find on the main lines from identical observations at scattered locations and one should make allowance for it.

Q. Although you didn't see it?

A. That is right.

Q. But where you had two of the same things, the same conditions observed on a transmission line and on a gathering line, pitting in both places of the same kind, you put the transmission line in 95 percent condition and you put the gathering line in 90 percent condition?

A. No, I did not.

Q. That is what I thought you said.

A. No, that is not what I said.

Q. What did you say?

A. I said that on the main lines for the average condition of pitting which I found, I made a deduction of 5 percent on that proportional part of the length which I computed to be pitted, and then I said that on the gathering lines where I had data that showed there was pitting, I estimated that on the average that meant a loss of 10 percent value.

Pitting on none of these lines is severe. In most cases, it is trivial.

Q. Was that 10 percent based at all upon the fact that those gathering lines might be taken up ahead of the main transmission lines?

[fol. 2789] A. No, sir, it was not.

Q. Now, you have made a deduction, as shown on Exhibit 69, from the book cost for compressor station structures shown in Line 29 of Page 1 in the amount of $57,773.53 which, according to my arithmetical computation amounts to a deduction of 4.4 percent. Is that correct?

A. That appears to be 4.39 percent.

Q. Now, did you personally visit and inspect all of the compressor station structures?

A. No.

Q. Which ones did you not inspect?

A. I did not inspect the ones in the Local Area around Kansas City.

Q. Did you inspect all the others?

A. I inspected structures at all the other compressor stations, I did not make notations on every structure inspected.

Q. Well, now, will you give us the method used by you in arriving at your percent for compressor station structures, using as an example, for instance, the Lewisburg compressor station?

In the first place, tell me how long you were there, approximately?

A. Well, I was in Lewisburg about an hour and a half.

Q. What did you do when you were there?

A. I looked at the compressors in the main compressor building. I looked at the shop equipment in the shop [fol. 2790] building and the auxiliary equipment in the auxiliary building.

Q. Pardon me, Mr. Biddison. May I interrupt you and ask you to confine your answer to observations on the transmission station structures as distingnished from the equipment?

How much time did you spend making observations on the structures as distinguished from the equipment?

A. I couldn't separate those two because I was looking at one or the other alternately.

Q. About half the time on each would, you say?

A. I don't know.

Q. What did you examine about the structures?

A. I looked to see if they were well maintained, whether corrosion was manifest, whether windows and doors were intact and, I looked for signs of deterioration.

Q. Do you recall offhand in what percent condition you placed the Lewisburg compressor station structure?

A. For the compressor building at Lewisburg station I have deducted 10 percent.

Q. Do you have any breakdown of that percent as between the various items of property?

A. No, sir.

Q. That is an over-all figure for the entire structure?

A. That is correct.

Q. Now, in order that it may be perfectly clear, you didn't put a percent condition on the foundation, for instance, and then on the floors and then on the lighting, [fol. 2791] heating and plumbing, and then on the siding and roof, did you?

A. No, sir, I did not.

Q. How did you arrive at this over-all 10 percent?

A. That is my judgment after having looked at the structure and found that so far as the framing was concerned there was no deterioration noticeable, but having also noted that there was some loss of zinc on the galvanized coating on the corrugated sheets.

Q. What part of the cost, would you say, of a structure of this kind, is represented by the walls and roof, that is, the corrugated sheet iron to which you referred?

A. I can't give you a breakdown on that. I have nothing before me that would give it.

Q. Do you have a rough idea of approximately the percentage of the over-all cost?

A. I have nothing before me. It would be purely a guess on my part in the absence of any information being available.

Mr. Culton: You might refresh his memory, Mr. Littman, from what you are looking at there.

By Mr. Littman:

Q. Did you look at the roof of this compressor station structure at Lewisburg?

A. Yes.

Q. How did it look to you?

[fol. 2792] A. It looked like some of the galvanizing was pretty thin on it, on the old portion.

Q. Did you make any inquiry of any one at the compressor station with respect to the condition of that roof and the corrugated sheet-iron walls?

A. I don't recall having done so. I don't think I did.

Q. Well, in what percent condition, you having observed this roof and the walls, would you put the roof and the walls?

A. I didn't segregate it. As I stated, I deducted 10 percent for the structure.

Q. Well, you looked at it, didn't you?

A. Yes.

Q. Well, tell us.

A. I have told you.

Q. Tell me now. What percent would you have put it in had you made a segregation? You saw it, and it wasn't very long ago.

A. I don't know. I deducted 10 percent on the building as a whole, and I did not make a separate determination of the amount to be deducted on the constituent items thereof, nor did I make any records from which I could do so.

Q. Did I ask you, Mr. Biddison, whether you did or didn't? I asked you now to state the percent condition which you would, in your opinion, place upon the walls and roof of the Lewisburg compressor station.

[fol. 2793] A. I don't know.

Q. You were talking a minute ago about the condition it was in. You said it had lost some metal and so forth. Don't you remember enough about it to give us an idea of the percent condition?

A. No, sir, I do not. My field notes do show that on the main building, the galvanized sheets were about 90 percent condition, but I have no segregation whatever as between walls and roof, but the over-all figure on those sheets.

[fol. 2795] By Mr. Littman:

Q. Now, you have made an allowance or deduction for depreciation as shown on Page 2 of Exhibit 69 near the bottom of the page of $42,540.70 for depreciation on the gasoline system property.

That represents a deduction for depreciation of 6 percent, does it not?

A. That is substantially it. It looks like it would be just about that.

Q. All of this property described in Lines 19 to 29, inclusive, represents the Liberal gasoline plant, does it not?

A. Yes, sir, and Lines 26 and 27 represent construction work in progress at the gasoline plant.

Q. Yes, that is a small item. And, of course, you have made no deduction for depreciation on that?

A. That is correct.

Q. Do you know when the Liberal gasoline plant was constructed? A. 1936.

Q. So that at June 30, 1941, this plant was approximately 4½ years old, wasn't it? A. Yes.

Q. Now, your deduction of 6 percent for depreciation represents an average depreciation of 1.33 percent per year since the gasoline plant was constructed 4½ years ago, does it not?

[fol. 2796] I am speaking now of an average.

A. The total amount which is depreciated divided by its age represents a figure about like that.

Q. Now, you are claiming in Exhibit 68 for an annual allowance for replacements on this gasoline plant as shown in Line 33 of that exhibit the sum of $34,993, or 5 percent per year, are you not?

A. Yes, sir, that is correct.

[fol. 2797] Q. At any rate, your claim for annual allowance for amortization and for replacements on the Liberal gasoline plant totals approximately $50,000 a year, does it not?

A. Yes.

Q. And your deduction for accrued depreciation over the expired life of Liberal gasoline plant of 4½ years is only $42,540. Is that correct?

A. That is right.

Q. Now, let's turn to general office equipment, Mr. Biddison. You have deducted approximately 15 percent for depreciation on that equipment, have you not?

Line 2 of Page 2 of Exhibit 69 shows office equipment as per books in the amount of $78,082.36, and the deduction [fol. 2798] for depreciation in the amount of $11,712.35, which makes a reduction of 15 percent, does it not?

A. Yes, sir.

Q. Now, how did you go about determining the depreciation to be deducted for the office equipment?

A. That is simply my judgment of the amount by which that equipment has lost value.

Q. Did you observe all of the office equipment owned by Panhandle Eastern Pipe Line Company, wherever located?

A. I don't think so.

Q. How much of it did you observe approximately, in percentage?

A. Well, I think probably I have seen 75 or 80 percent of it.

Q. Did you ascribe a definite percentage to each item of office equipment that you observed?

A. I did not. I estimated that, on the whole, it had lost about 15 percent of its value.

Q. How did you estimate the 80 percent of this equipment that you didn't see?

Mr. Wheat: The what percentage?

Mr. Littman: The 20 percent. I am sorry.

The Witness: I didn't estimate it. I estimated that, on the whole, this $78,082.36 worth of office equipment had lost 15 percent of its value in one estimate. I didn't [fol. 2799] segregate it down between property which I had seen and property which I had not seen. I didn't break it down at all in any way, shape or fashion.

Q. How did you arrive at the percent condition of the property which you did not see, by the observation method?

A. I didn't arrive at it separately. I arrived at the conclusion from what I did see, that the property as a whole had lost value to the extent of 15 percent and, therefore, I deducted 15 percent.

Q. Without looking at one-fifth of it?

A. That is right.

. . . . . .

[fol. 2801] Q. Suppose you tell us upon what you based this 15 percent. What did you look for, and what did you see? Tell us about it.

A. I saw the equipment was generally in excellent condition and showed little signs of wear and tear; that the machines and calculators were in excellent shape; that the steel filing cases showed practically no wear and tear.

Some of the office furniture and fixtures was of quite recent purchase.

Now, I have at various times examined office furniture and fixtures in detail and assigned a specific condition to each and every individual item on the inventory, and having done that in some other cases, I think I have been expe-[fol. 2802] rienced enough in looking at that sort of material that I can form an over all judgment that may not be exact, but is close enough to the truth to serve the purpose and very little in error, if any, one way or the other.

Mr. Lee: Did you have before you the books of the company showing what this furniture cost?

The Witness: I did not.

By Mr. Littman:

Q. You had to have the cost of the property or some basis of cost in order to make a proper weighting, and in order to arrive at a properly weighted percent condition, did you not?

A. As I have previously stated to you, Mr. Littman, in regard to this item of office furniture and fixtures, and I will state it again, I did absolutely no weighing on it whatever.

It is my judgment that that property as a group has lost 15 percent of its value.

Mr. Lee: Without [tell] us what that value is from which you deducted 15 percent?

The Witness: Yes. The value against which I applied the 15 percent is shown in the exhibit which we are discussing.

* * * * * * * *

[fol. 2806] P. McDonald Biddison, a witness, having been previously sworn, resumed the stand, was examined and testified as follows:

Cross-Examination (Continued).

By Mr. Littman:

Q. Mr. Biddison, did you make an inventory of the property of the Panhandle Eastern Pipe Line Company and its wholly-owned subsidiary, Illino Natural Gas Company?

A. I compiled an inventory.

Q. What was the basis of your compilation of inventory?

A. The basis of my inventory was a statement of the property upon the plant and property records, details of property records maintained by the Gas Production Department, details of gas property maintained by the Engineering Department of Panhandle Eastern Pipe Line Company, and with respect to some small classifications of comparatively small amounts of property, a field check and inventory. That applied, however, to a very small amount of property.

Q. Is that the character of an inventory that you usually make for purposes of rate proceedings?

A. It is if there is sufficient information available. If there be not sufficient information available, it is some-
[fol. 2807] times necessary to resort to field count in order to obtain suitable inventory. That is seldom necessary, however.

Q. Well, let me see if I correctly understand your testimony with respect to inventory.

You relied on the records or inventory made by the company, did you not?

A. Very largely.

Q. In other words, you did not go out and make your own inventory of the property, did you?

A. I didn't go out and make a new count on the property. I relied on the data which was available in the office, with some supplemental checks in the field on some few items and spot checking on general items.

Q. Do you know, of your own knowledge, whether all the property whose book cost is reflected in Exhibit 69, is all present and accounted for as used and useful in the public service?

A. I do not.

Q. In arriving at your weighted percent of depreciation to be deducted, did you base your percentages upon the assumption that all the property whose cost is included in Exhibit 69 was all present and accounted for as used and useful in the public service?

A. It was not necessary to make any assumption whatever in that regard. I determined the percentage by which [fol. 2808] various classifications of property have lost value. I have applied those percentages to the stated value.

Q. Well, in arriving at your basic percentages of depreciation, you took the company's inventory at face value, did you not?

A. I did not take any inventory in connection with Exhibit 69. I simply applied the results of my observations to the stated book value of the various classes of property.

Q. Well, I am now speaking of your original determination of the depreciation based on the reproduction cost of the property.

A. In my reproduction cost estimate of the property I made spot checks to check the inventory, and I checked the records in the Engineering Department against those on the plant and equipment records to reconcile any discrepancies, and to make sure that there were no material errors in inventory that would affect the result.

Mr. Wheat: May I ask the witness a question?

Mr. Littman: Yes.

Mr. Wheat: In this last answer, you were referring to what you did in connection with Exhibit 62, were you?

The Witness: Yes, and 39.

By Mr. Littman:

Q. How extensive was your spot check of the company's inventory?

[fol. 2809] A. Well, I checked the footage of pipe on various lines as shown by the plant and equipment records, with the footage shown by the Engineering Department's survey records upon completion of lines.

I checked the fact that the compressor stations are substantially as called for by those records.

I have been in every one of them. I had been in all of them prior to the time of preparation of this case and knew what most of them contained. I have been in every one of them since.

I have seen a great many of the structures under the heading of "Transmission system measuring station structures." I have seen a great many of the wells and well measuring station structures and their equipment. I have taken photographs of the system from one end of it to the other.

Q. Did you make any inventory of the office equipment? A. I did not.

Q. Did you make any check of the company's inventory of the office equipment? A. I did not.

Q. In other words, you cannot state positively that all of the office equipment which appears on the company's books as of June 30, 1941, is present and accounted for and used and useful in the public service, can you?

A. Obviously not, since I didn't take an inventory of it, [fol. 2810] obviously not.

Q. Do you know what amounts have been accumulated in the depreciation reserves of the Panhandle Eastern system June 30, 1941? I mean by "depreciation reserves" reserves for depreciation and amortization and depletion.

A. No, sir, I do not have that data before me.

Q. Do you have a copy of Exhibit 48 before you?

A. No, sir.

Mr. Culton: It is Mr. Watkins' balance sheet.

The Witness: No, sir.

By Mr. Littman:

Q. I hand you a copy of Exhibit 48 and refer you to Page 2, lines 28 to 33, inclusive, and ask you whether I am correct in stating that the balance in the reserve for depreciation of gas plant as of June 30, 1941, was $9,345,403.01?

Mr. Wheat: Are you asking this witness to testify as to a fact on that or whether he sees that figure on that exhibit?

Mr. Littman: I am asking him whether he knows that to be a fact.

By Mr. Littman:

Q. Do you know that to be a fact?

A. All I know is that the figure is correctly read from the line and page of the exhibit quoted.

Q. Do you know whether or not that is the correct balance in the reserve for—

A. (Interposing) All I know about it is—

[fol. 2811] Q. Just a minute. —For depreciation of gas plant as of June 30, 1941?

A. All I know about it is that the figure was correctly read from the line and page of the exhibit quoted.

Q. Am I correct in stating that the figure shown for reserve for amortization and depletion of producing natural gas land and land rights, as of June 30, 1941, is $403,389.43 as shown on that exhibit?

A. All I know is that the figure has been correctly read from the line, page and exhibit quoted.

Q. And am I correct in reading from that exhibit that the reserve for abandoned leases at June 30, 1941, was $386,721.48?

A. All I know is that the figures were correctly read from the line, page and exhibit quoted.

Q. Do you have an opinion as to whether or not the total of those amounts of $10,135,513.92 represents reasonable and proper reserves?

A. Yes, I have an opinion on that matter.

Q. And what is that opinion?

A. My opinion on that matter is that as a matter of corporate business policy those reserves are a satisfactory balance for the present situation.

Q. And they are reasonable and proper?

A. From a corporate and business standpoint, yes, sir.

[fol. 2812] Q. Well, what other standpoint do you have in mind?

A. Well, from the standpoint of testing for what may be called the reserve requirement, I do not know whether they are in line or not.

Q. You advised the company, did you not, that the aggregate annual provision and the total reserves provided to date, were reasonable and proper?

A. I have so advised them upon occasion.

Q. And am I correct in stating that the total deduction that you recommend from book cost for depreciation is the amount shown at the bottom of page 2 of Exhibit 69 in the amount of $3,903,102.46?

. . . . . .

The Witness: I have not recommended it as a deduction from book cost. I have computed it as the amount by which the property had lost value, basing the computation upon book cost.

By [the] Littman:

Q. The figure that I have read you is the total deduction? A. $3,903,102.46, yes, sir.

Q. Before leaving Exhibit 69, Mr. Biddison, I would like to take up the account shown on Page 1 of that exhibit entitled, "Compressor station equipment" shown in Line 34, which has a book cost of $8,436,264.23, and [fol. 2813] from which you deducted for depreciation the sum of $622,777.63.

I believe you have explained generally the method used by you to determine the depreciation to be deducted. That method was based upon the total hour life and expired hour life of the machinery, was it not?

A. It was for the main compressing units and for the auxiliary engine and generator units. It was not for any other property.

Q. Can you state the total life used by you for engines Nos. 500, 503, 504 and 505 at the Olpe station?

A. Are those numbers of main compressor units?

Q. Yes.

A. I have based the life of the main compressor units at Olpe station upon 300,000 engine-hours.

Q. And what was the expired life expressed in hours of these engines?

A. One engine had operated 14,881 hours.

Q. Which one was that?

A. No. 500. No. 501 had operated 15,087 hours; No. 502 had operated 15,329 hours; No. 503 had operated 14,808 hours; No. 504 had operated 14,014 hours; No. 505 had operated 12,180 hours.

Q. Mr. Biddison, did you know at the time you made your estimate of the depreciation to be deducted for these engines, that several of the cylinders had been [fol. 2814] changed from their original positions due to repair of cracks and leaking liner joints?

A. Yes, sir. I have before me a record of those changes.

Q. Did that affect your determination of depreciation? A. Yes.

Q. How?

A. That is one of the things that I am accounting for by this allowance of deduction in value based upon engine-hours used.

Q. Does your 300,000 engine-hour figure take those things into account that I just named, such as cracks and leaking liner joints?

A. Yes, and if these things become serious and of great moment they will depreciate an engine more than the engine-hours basis that I have used.

If they are not of any moment, then the engine does not depreciate as much as in proportion to the engine-hours, the way I set it up.

Q. Now, on the Haven station your deduction for depreciation was there also based upon relating the expired life in engine-hours to the total life expressed in engine-hours, was it not? A. That is right.

Q. Do you recall whether it was the same total engine-hour life at the Haven station as at the Olpe station, namely, 300,000 engine-hours?

[fol. 2815] A. No, sir. At Haven station I used 325,000 engine-hours total life.

Q. Mr. Biddison, I don't recall whether you have stated on the record the total engine-hour life used by you for each of the compressor stations.

I know you gave some of them in your direct examination but I don't know whether they were all given. Could you refresh my recollection on that?

A. No, but I can put them in the record right now.

Q. And then we will have them all at one point in the record.

A. The total lives for engines and operative engine-hours which I have used in the determination of the amounts to be deducted for depreciation which has occurred in that equipment is as follows for the main compressor engines:

Sneed station ..... 325,000 hours;
Hansford station ..... 200,000 hours;
Liberal station ..... 350,000 hours;
Greensburg station ..... 325,000 hours;
Haven station ..... 325,000 hours;
Olpe station ..... 300,000 hours;
Lewisburg station ..... 350,000 hours;
Houstonia station ..... 325,000 hours;
Centralia station ..... 300,000 hours;
[fol. 2816] Pleasant Hill Station ..... 300,000 hours;
Glen Arm station ..... 350,000 hours;
Tuscola station, for the horizontal units, 300,000 hours;
for the vertical units ..... 200,000 hours.

Q. Have you completed your answer? A. Yes.

Q. When you made your determination of depreciation of the compressor equipment at Haven station, did you know that during the 1941 over-haul four of the power cylinders at that station were found to be cracked and were repaired by the chain lock process?

A. Yes. I had a letter before me telling me about that. I asked for a statement of matters of that sort in this connection.

Q. Did that affect the total number of engine-hours which you used, up or down? A. No.

Q. In other words, am I correct in understanding that you would have used the same total engine-hour life whether you were in possession of that information or not?

A. Certainly, I would use the same engine-hour life. The engine-hour life is predicated upon a general knowledge of the way in which machinery of this character

performs. I have been working with machinery of this character since 1905, and based upon experience during that period I set up these lives for units of the various [fol. 2817] classes.

Now, the condition on these cylinders is one of having been repaired and taken care of; not a condition of being out of repair.

Q. Am I correct in understanding that you would have used 325,000 engine-hours of life for the compressor engines at Haven station irrespective of whether these repairs had been made?

A. Certainly because the life is not predicated upon whether or not you are going to have a crack or two in a cylinder or in an exhaust valve part.

The life is predicated upon how long you are going to be able to keep the unit in service.

These things here may readily affect how much it will cost you to keep the units going throughout that life, but they are not the things that fix the life.

Q. And you have made a provision for replacements to take care of repairs such as those which I have described, in your Exhibit 68, have you not?

A. No, sir. These repairs are maintenance. There is no replacement of a unit there at all. It is a plain, ordinary repair charged to maintenance.

Q. Now, if an entire cylinder were replaced, what would that be charged to?

A. Under the classification of Panhandle Eastern Pipe Line Company that is a retirement and would be charged [fol. 2818] against the reserve account.

Q. And if these repairs to the cracked cylinders do not hold up and the entire cylinder has to be replaced, of course the cost of the entire new cylinder would come out of such an allowance as that made by you in Exhibit 68?

A. That would be the net effect of it. That would not be the process, I suppose, through which the matter would be carried. The new cylinder would be a capital charge and the one removed would be charged against reserve.

The net result is the same as I mentioned and that is the way I usually like to think of it but to do so in a

proceeding of this sort gets you snarled up when you are providing for retirements or replacements.

Mr. Chamberlain: Would the cylinder be a unit?

The Witness: It is under the classification used by Panhandle Eastern Pipe Line Company.

Mr. Chamberlain: But not in the present Uniform System of Accounts?

The Witness: This classification in use by Panhandle Eastern Pipe Line Company is in accordance with the classification requirements of the Federal Power Commission.

Mr. Chamberlain: And under that they have determined that the cylinder would be a unit?

The Witness: That is correct.

* * * * * * * *

[fol. 2820] Trial Examiner: May I ask a question in connection with your testimony as to the exhibit marked for identification as 69?

After listening to these questions and answers the Trial [fol. 2821] Examiner's understanding of the purport of the entire testimony with reference to this exhibit might be condensed into this question which I will now ask:

Your deductions for depreciation as shown in this proposed Exhibit 69 reflect only your judgment of the present physical and mechanical condition of the property, as an indication to you of the percentage of useful life or capacity for service already consumed.

And in this study you have not taken into account the fact that this property may not be worn out before the gas is exhausted.

Is that a correct statement?

The Witness: Not quite, Mr. Examiner.

The deductions do include some allowances for obsolescence, they do include some allowances for loss in value or loss in service life, that cannot be seen. They do take

into account in the Local Area the fact that the reserves have been heavily depleted.

It is true, however, that generally the amount of deduction for depreciation which I have estimated is that which can be determined by investigation of the physical aspects of the property.

It is not, on the other hand, a determination of the deduction on the basis of making the deduction in proportion to the expired life in years compared to the total life in years.

* * * * * * *

[fol. 2822] Mr. Lee: (Interposing) But the last part of the question as given by the Examiner was: "Have you taken into account the fact that the property may be worn out before the gas supply is exhausted".

Mr. Wheat: "May not be worn out."

The Witness: Yes, sir, I have taken that into account and I feel certain that the property will not be worn out at the time the gas supply is exhausted.

On the other hand, I feel certain that the property will be in pretty good operative condition at the time the gas supply is exhausted and for that reason there must be provided an accrual to make the replacements that will be required to let it operate until the supplies are exhausted, and because it will have been maintained in a highly efficient state of operation, in order that the investment in it may be recouped there must be an allowance made for amortization of that investment because this highly efficient plant when the reserves are gone [fol. 2823] will be worth just salvage value.

There is another sense, however, I think, in which maybe I have not answered that part of your question, and that sense is that I have not predicated the deduction for depreciation upon any ratio of past production to total reserves. I have not considered that in general this property has depreciated, because of the partial depletion up to date of its reserves and because of the shortening of its total life by the expired life expressed either in years or in reserves.

Trial Examiner: This answer may or may not clarify the problem that was in the Trial Examiner's mind. It seems to me, Mr. Biddison, in your Exhibit 66 you approached the retirement problem purely from the standpoint of the life of a wasting asset, the exhaustion of the gas reserves, but I did assume that in your proposed Exhibit 69 you had attempted to measure depreciation from a standpoint purely of the present physical condition without regard to the number of years that this property would be required in its present purpose or its present service.

I think this will all clear up, undoubtedly, on the redirect, but the answers which Mr. Biddison has just given have rather—

Mr. Culton: (Interposing) Clarified it to some extent in your mind?

Trial Examiner: To some extent.

[fol. 2824] Mr. Littman: I think, Mr. Examiner, that in view of the fact that we have just completed our cross-examination on Exhibit 69 it might be wise to go over the various elements that he did or did not consider, to make certain on this record as to just what they were.

It won't take a minute, and I think it will clarify this record.

By Mr. Littman:

Q. Mr. Biddison, did you consider in arriving at your estimate of depreciation to be deducted, the wear and tear—and I appreciate you have answered this once but I think it should be summarized again here at this point while your recollection is refreshed and so is ours—did you consider wear and tear? A. I did.

Q. Did you consider decay? A. I did.

Q. Did you consider the action of the elements?

A. I did.

Q. Did you consider inadequacy? A. I did.

Q. Did you make any deduction for inadequacy?

A. I did.

Q. In what instance—in the Local Area?

A. No; in general on my allowance on the gasoline plant. I have made some allowance there for inadequacy.

[fol. 2825] Q. Is that the only place or are there others?

A. That is the only one that I recall now.

Q. If there are others, they would be—

A. Minor amounts.

Q. Did you consider the factor of obsolescence?

A. I did.

Q. Where? A. Particularly in the Local Area.

Q. Are there any others that you now recall [then] the Local Area, in which you made any deduction for obsolescence?

A. Not that I recall. If there be others, they are of less amount even than the Local Area property.

Q. Did you consider changes in the art?

A. Yes, but I do not think I have any allowances that could be particularly attributed to changes in the art.

Q. You considered it but you didn't find any or make any deduction for any. Is that correct?

A. That is correct.

Q. Did you consider changes in demand and requirements of public authorities? A. Yes, sir.

Q. Did you make any deduction by reason of such fact?

A. I don't recall having done so. I think I did not.

Q. Did you consider and did you give effect to the ex-
[fol. 2826] haustion of the natural gas supply?

A. I did where I thought that exhaustion or approach of exhaustion had reached the stage that it produced an effect upon value.

Q. Now, your answer with respect to the effect that you gave to it applies only to property in the Local Area, does it not? A. That is correct.

Q. In other words, is my understanding correct that you gave no effect to the exhaustion of the natural gas supply anywhere in the entire Panhandle Eastern system other than in the Local Area? A. That is correct.

Q. Now, in setting up your annual allowances for amortization in Exhibit 66, and in setting up your allowances for depletion in Exhibit 67, and in estimating your annual accruals for replacements in Exhibit 68, taking the three together, I will ask you whether you considered the following elements— A. Yes, sir.

Q. Decay? A. Yes, sir.

Q. Action of the elements? A. Yes, sir.

Q. Inadequacy? A. Yes, sir.

[fol. 2827] Q. Obsolescence? A. Yes, sir.

Q. Changes in the art? A. Yes, sir.

Q. Changes in demand and requirements of public authorities? A. Yes, sir.

Q. And did you consider the exhaustion of the natural gas supplies? A. Yes, sir.

Q. And the latter answer applies to the entire Panhandle Eastern system, pipe lines, compressor stations and all of its physical properties, does it not? A. Yes, sir.

Trial Examiner: Mr. Littman, there would be no question as to the definition of "obsolescence" as used by the witness.

Mr. Littman: I have been reading to this witness the various elements that appear in the Uniform System of Accounts prescribed for natural gas companies on Page 4 of "Definitions", which in part reads as follows:—I will read the sentence that includes the elements:

"Among the classes to be given consideration are wear and tear, decay, action of the elements, inadequacy, obsolescence, changes in the art, changes in demand and requirements of public authorities, and in the case of natural gas companies, the exhaustion of natural resources."

[fol. 2828] Trial Examiner: Mr. Biddison, in your first answer to the question addressed to you by the Trial Examiner, if I correctly remember it, you used the word "obsolescence".

I think perhaps it might be well for you to define "obsolescence" as you used it in that answer.

The Witness: My recollection is that in that answer I used that term in speaking of investment in the Local Area.

Trial Examiner: You did not so limit it, but that may be included in your explanation.

The Witness: In the Local Area around Kansas City the properties have lost value by reason of the fact that reserves have been heavily depleted, and the investment would not now be made in full if it had not already been made.

That is, the present situation does not justify the making of the investment.

Now, under those conditions, I consider that obsolescence has taken place. It is that form of obsolescence resulting from the wasting away of the asset upon which the business depends, and the condition is referred to in the definition given in the Federal Power Commission classification of accounts which has just been read by Mr. Littman.

It is that particular condition that I have referred to under several circumstances as being a form of obsolescence.

Mr. Goodman: I understand your testimony in this way and will you please tell me if it is a correct understanding.

[fol. 2829] That in estimating the depreciation of a particular unit of property, you did not consider as bearing upon the amount of depreciation the fact that it was used in connection with a wasting resource.

You gave no consideration to the effect of a wasting resource if, in your judgment, an investor in the property would have found it advisable to place a new unit there of the same general type if the present one were to go out of service.

The Witness: That is correct.

Trial Examiner: Any other questions at this time in regard to Exhibit 69?

Mr. Chamberlain: One question I would like to ask here.

Cross-Examination

By Mr. Chamberlain:

Q. You acted as a consulting engineer for Panhandle Eastern in respect to the preparation of their registration statement for the issuance of bonds and their listing agreement with the New York Stock Exchange as mentioned heretofore, and in doing so it is correct, is it not, that you passed upon the propriety or reasonableness of the aggregate annual provision and, secondly, the reasonableness of the total reserves provided to date?

A. I have passed upon such matters upon several occasions.

Q. Well, now, in 1940 you passed upon the reasonableness of the provision for depreciation, depletion and amortization for the years 1938, 1939 and 1940, did you not?

A. I don't think I did all that in one year, for more than the one year.

Q. I call your attention to Exhibit 107 and the statement in Paragraph A at the top of Page 74.

Mr. Culton: What is the item which you are showing him? Is it a letter from Mr. Biddison or a statement from somebody else?

Mr. Chamberlain: A statement that the management has been informed by P. McDonald Biddison, an independent consulting engineer of Dallas, Texas, that in his opinion the annual amounts provided for depreciation, depletion and amortization were reasonable for this purpose.

The provisions for the years 1938, 1939 and 1940 were equal to 2.90 percent, 3.20 percent and 3.16 percent of consolidated property, book, plant and equipment accounts at the beginning of the respective years.

The Witness: Yes, that is the company's statement.

By Mr. Chamberlain:

Q. You did not do that?

A. I never said anything about that percentage proposition they have there. I never made any statement about what that was or what it should be.

Q. You mean you did not go through the formula of ascertaining the percentage, although you said that the [fol. 2831] amount was reasonable?

A. I mean by my statement that I did not determine those percentages.

Q. You mean you did not perform the mechanical feat of determining the percentage after determining that they were reasonable?

A. I didn't determine those percentages at all. Those are somebody else's determinations and you can take an amount of money and divide that by another amount and find it is a certain percentage. Somebody else did that, and not me.

Q. All right, then, I refer you to Page 73 of Exhibit 107 which shows the annual accruals for depreciation,

depletion and amortization of property account and equipment, and also the amortization of gas sales and purchase contracts, and ask you whether the figures for that were not submitted to you and whether it was not from those figures that you made your determination of reasonableness?

A. I think that is correct. I think those are probably substantially the figures that I advised them I thought were reasonable.

Q. Then, the percentages that are quoted on Page 74 are merely mathematical computations from what you said were reasonable, are they not?

A. That is correct, and it is quite apparent that I would [fol. 2832] not go out and state that a percentage figure was reasonable on property when the sums we are talking about contain items for depletion which don't properly tie in with property value.

Q. I think it would be a good time to get in the record here these facts and figures. It won't take but a few moments.

I hand you Exhibit 106 which is a registration statement of Panhandle Eastern under the Securities Act of 1933, Registration No. 2-4579, filed November 18, 1940, and I will ask you to state into the record the amount of the property, plant and equipment account as of the beginning of each of the years 1938, 1939 and 1940 as it was given to you at the time of making these conclusions.

A. I don't know whether those figures are on that page or not.

Q. Would you mind looking?

A. I can't identify the figures. All I can do is read the figures that are stated there. Whether they are the ones I used at that time, I don't know.

Q. Do you suspect that they gave the wrong figures?

A. I have no suspicions at all. I am telling you I don't know.

Q. All right. Were you to look at Schedule 5 identified as S-15, what do you find to be the balance of that account as of the beginning of the year 1938?

A. $58,060,015.10.

[fol. 2833] Q. Now, what does that show the amount of the account at the beginning of 1939 was?

A. $58,547,869.68.

Q. And what was the amount at the beginning of 1940?

A. $59,479,728.22.

Q. And what was the amount of the account at the close of 1940 which would necessarily be the beginning of 1941?

A. $64,854,956.29. Each of these amounts is qualified by a statement on this page of note A on the balance sheet, I don't know what that refers to.

Q. Well, that doesn't qualify your—

A. (Interposing) It doesn't qualify my reading of the figures from the page, but it might qualify their interpretation in some respects. I don't know.

Q. Now, Mr. Biddison, was not a copy or proof of that registration statement under the prospectus sent you before it was filed, and did you not check it before they filed it? A. No.

Q. You did not see that?

A. Well, I think I have seen it, yes. I think probably I have a copy of it.

Q. You haven't the slightest idea that the figures are not correct?

A. I don't have any reason to doubt their correctness at all.

. . . . . .

[fol. 2835] By Mr. Chamberlain:

Q. Mr. Biddison, do I understand you correctly, that you merely gave them a judgment figure of what would be a reasonable accrual on that property?

A. I gave them my judgment after investigation.

Q. But your judgment was that the aggregate amount which had been accrued each of those three years was sufficient. How could you do that without knowing what amount had been accrued and upon what amount of property it was accrued?

A. I did know the amount of property on which it was being accrued and I did know the amount of accrual for the various purposes.

Q. Then, is your objection to adopting the figures appearing in the prospectus as to the amount of the accruals? Is that your objection, that you do not want to adopt those

figures? I call your attention to Page 73 of Exhibit 107 and ask you if—

Mr. Littman: That is 106 for identification.

Mr. Chamberlain: No, 107, the prospectus.

Mr. Littman: Oh, I am sorry.

By Mr. Chamberlain:

Q. I ask you if the figures following the line reading: "Depreciation, depletion and amortization of property, plant and equipment" and the figures following the lines [fol. 2836] "Amortization of gas sales and purchase contracts" do not cover the entire amount of accruals which were submitted to you as being the aggregate which you were to determine the reasonableness of.

A. I don't know. If had copies of my letters here on that matter I think I could tell that, but I can't recall those figures after two or three years.

Mr. Wheat: We can furnish copies of those letters to you, Mr. Biddison.

Trial Examiner: Mr. Culton, you might perfect the record perhaps, on this incident.

Mr. Culton: We will furnish those as exhibits.

Trial Examiner: You have now handed Mr. Biddison some data which will perhaps refresh his recollection. That is what I had in mind and I have now stated it for the record.

Mr. Culton: We will now clear it up by presenting to the witness letters signed by him and addressed to Panhandle Eastern Pipe Line Company or different officers of it, dated December 13, 1937, December 29, 1938, December 8, 1939 and January 11, 1941, which we ask to have marked for identification as the next exhibit numbers, Mr. Examiner.

Trial Examiner: These will be marked as indicated and in the order read as Exhibits Nos. 108, 109, 110 and 111 for identification.

(The documents referred to were marked for identifi- [fol. 2837] cation as Exhibits Nos. 108, 109, 110 and 111, respectively:)

Mr. Culton: We will have copies of those and deliver them to you immediately after lunch.

The Witness: In exhibit 107, page 73, the amount shown to have been accrued for depreciation, depletion and amortization, including in amortization gas sales and purchase contracts is $2,055,500.

Mr. Wheat: May I ask for what year you are reading, Mr. Biddison?

The Witness: For the year 1938. I reported to them upon December 13, 1937—

Trial Examiner: Whom do you mean by "them"?

The Witness: The Panhandle Eastern Pipe Line Company. I reported to them that the amount which they at that time proposed to set up, $2,055,000, was within approximately $60,000 of the amount I considered proper.

Continuing for the year 1939 there is shown to have accrued $2,200,000 for the same purpose and, upon December 29, as shown by Exhibit 109—

Mr. Wheat: What year?

The Witness: December 29, 1938, as shown by Exhibit 109, I advised them that the amount of $2,100,000 which was the amount then proposed to be set up, was a reasonable provision, and continuing, for the year 1940 there is shown to have been accrued $2,210,000, and I advised Panhandle Eastern Pipe Line Company upon December 8, [fol. 2838] 1939, as shown by Exhibit 110, that the amount which they proposed to set up, $2,200,000, was a reasonable provision.

I have furthermore advised them upon January 11, 1941, as shown by Exhibit 111, that the amount which they proposed to set up for these same purposes for the year 1941, namely, $2,400,000, was a reasonable provision for depreciation, depletion and amortization.

Mr. Wheat: In that connection, Mr. Examiner, may I advert to the statement which at the request of counsel and the Examiner I made, I think on the second day of the

cross-examination, which showed that Mr. Watkins' Exhibit 49 disclosed that for the year 1941 with six months actual and six months estimate, the provision for these items would in his estimation be $2,414,657? I think the record should be tied in there so that it will show.

Trial Examiner: I am glad you referred to that. You will find that, gentlemen, commencing at Page 2482 of the transcript and I think that reference will be of interest in connection with all of Mr. Biddison's testimony given this morning.

Mr. Chamberlain: Your estimate as to the reasonableness of these accruals included, did it not, the amount, or an amount for the amortization of the gas sales and purchase contracts which were carried on the books of Panhandle during the years 1938, 1939 and 1940 as $2,930,236.40—

[fol. 2839] Mr. Wheat: From what are you now reading?

Mr. Chamberlain: Exhibit 52, page 2.

The Witness: Yes, sir, I do.

By Mr. Chamberlain:

Q. And in the operating statement on Page 73 of Exhibit 107, the amount of amortization for gas sales is stated separately from that covering the depreciation, depletion and amortization of property, plant and equipment account? A. Yes, sir.

By Mr. Chamberlain:

Q. Referring to Exhibit for identification No. 111—well, I will waive that because it shows it includes a provision for amortization of the gas contracts.

A. Yes, sir, each of those accruals includes that provision.

Q. Now, Mr. Biddison, the depreciation which you have computed in your Exhibit 69 is as of June 30, 1941, is it not? A. Yes, sir, June 30, 1941.

[fol. 2840] Q. The depreciation which you found there would be as great as it would be—or, it would be in excess of what it would have been there on December 31, 1940, would it not, or at least not less?

A. I judge it would be in excess of that existing six months previously.

Q. I make no point of the difference, but it would have been as much, would it not, at the end of December—or a little less?

A. I think so. I can't think of any reason that would reverse that general trend.

Mr. Wheat: Difference in additions?

The Witness: Difference in additions could change it as a matter of percentage, but as to the amount of dollars I don't see anything to change the general forward trend at that time.

By Mr. Chamberlain:

Q. It would be substantially the same amount, would it not?

A. The difference would be so small as to be very difficult of determination.

Q. Now, in reaching your conclusions that the aggregate of the cumulative reserve was reasonable to cover the depreciation, depletion and amortization on the property, I refer you to Page 71 of Exhibit 107 which shows the reserve for depreciation, depletion and amortization of [fol. 2841] property, plant and equipment as of December 31, 1940, and this is consolidated and is $9,189,501.24.

Now, that figure was at your disposal in order to make your determination, was it not?

A. I don't know if that exact figure was or not, but some figure representing that definitely was.

Q. It is substantially so, isn't it?

A. I have no reason to doubt the correctness of the figure here.

Q. Now, again referring to your Exhibit 69, you have made a careful examination of the depreciation on that property, have you not, and made your determination as to what that is? A. Yes, sir.

Q. Now, what is the balance, then, that would be covered in this $9,189,501?

A. That is simply the residue that is left in the account.

Q. Is that the amount, then, for amortization of the property plus the depletion of your gas lands only?

A. It is stated that the reserves for depreciation, depletion and amortization embrace that figure of $9,189,501.24.

. . . . . .

[fol. 2842] By Mr. Chamberlain:

Q. If I understand you correctly, Mr. Biddison, then it would be your judgment that of the $9,189,501.24 which had accrued for depreciation, depletion and amortization of property, plant and equipment, that not to exceed $3,903,102.46 would represent the depreciation existing in the plant account including gas wells, is that correct?

. . . . . .

The Witness: That is correct.

By Mr. Chamberlain:

Q. And the balance, then, would represent the depletion in leaseholds and amortization of the property?

A. Yes, sir, that is correct.

Q. I call your attention to Exhibit 108. I note the absence in Exhibit 108 of a statement which is contained in each of your Exhibits Nos. 109, 110 and 111, these for identification, to the fact that it is your opinion that the reserves for retirements, depletion and amortization at December 31, 1938, are reasonable reserves based on age and estimated life of the properties.

[fol. 2843] What was the reason for its omission in your letter of December 13, 1937, Exhibit 108?

A. I do not know. I just suppose I was not asked to make an expression on the matter and, therefore, did not do it. That is the only explanation I can give at this time. That is something that is not very fresh in my mind.

Q. Yes. I call your attention to Exhibit 52 on Page 2, which shows the gradual accumulation of the reserve for depreciation of gas plant and ask if the condition of that reserve up to and including 1937 refreshes your recollection as to your reason for its omission?

A. No, sir, it does not. I can give you no explanation of its omission except that I presume that I did not make an expression on it because I was not asked for an expression on it.

Q. You knew they had been accruing very light reserves up to that time, Mr. Biddison?

A. Yes, sir, that is correct.

Q. And that, up to that time the reserve was not such as would cover the depreciation on the property based on the age-life theory?

A. I do not know anything about that point. I made no investigation on that point.

Q. Then, in 1937, you made no investigation with respect to that?

[fol. 2844] A. No, sir, I did not.

Q. Then, in 1938, 1939 and 1940 you were asked to form an opinion with respect to the sufficiency of the reserve based upon the age-life theory?

A. No, sir, and never made any expression of it based on the age-life theory. When I say "age-life" theory in that respect, I mean the use of the relation of age to life as a measure of loss in value on property.

Q. I read from Exhibit 110 for identification, your letter to Mr. Neuner, Vice President of Panhandle Eastern under date of December 8, 1939:

"Further, in my opinion, the reserves for retirements, depletion and amortization at December 31, 1939, are reasonable reserves based on age and estimated life of the properties."

A. I meant by that that these properties had a long future life and that they had a low average age. I do not mean by that at all that I based the sufficiency of the reserve accruals upon any ratio of expired life to total life because I did not do that.

Q. You continued that statement each year, did you not, for the years 1938, 1939 and 1940 and also in your letter of January 11, 1941? A. I believe so.

* * * * * * *

[fol. 2846] Mr. Littman: I understand that.

Mr. Examiner, that completes, for the present, our cross-examination of Mr. Biddison on his exhibits. However, there is a matter I would like to have clarified in [fol. 2847] the record before going to another subject.

Is my understanding correct, Mr. Examiner, that Exhibit No. 39 entitled, "Panhandle Eastern Pipe Line Com-

pany and Subsidiary Companies Reproduction Cost New of Plant and Property in Business as of June 30, 1941" has been excluded in its entirety?

Trial Examiner: That is true.

Mr. Littman: Is it also true, Mr. Examiner, that Exhibit No. 39-A which is entitled, "Correction Sheets for Exhibit No. 39" is also excluded?

Trial Examiner: That is also excluded. The ruling of exclusion was made on November 24 and the ruling of exclusion applied, generally, to exhibits establishing reproduction cost or in which the reproduction cost element was conspicuous and while no specific mention was made at that time of Exhibit 70 and Exhibit 71, the ruling then made would also exclude proposed Exhibits 70 and 71.

Mr. Littman: Is my understanding also correct, Mr. Examiner, that Exhibit No. 62 is also excluded?

Trial Examiner: The ruling would also embrace the exclusion of proposed Exhibit 62 which was specifically mentioned in the ruling on November 24.

Mr. Littman: Now, we made an objection to Exhibit No. 38 which was presented by Witness Morton and which consists of two pages. I do not recall that your Honor had [fol. 2848] made any specific ruling as to the said Exhibit No. 38.

Trial Examiner: There has been no ruling that would affect the admission or exclusion of Exhibit No. 38.

. . . . . .

[fol. 2849] Trial Examiner: There being no objection to the reception in evidence of the studies marked for identification as Exhibit 69, this exhibit will be received in evidence.

. . . . . .

Mr. Culton: Defendant notes an exception separately as to the exclusion of each of the Exhibits 39, 39-A, 62, 70 and 71.

. . . . . .

Mr. Littman: Is my understanding correct, Mr. Examiner, that Mr. Wallace's Exhibits 37 and 37-A are excluded?

[fol. 2850] Trial Examiner: These were excluded by the ruling of November 24.

Mr. Culton: And the same exception for the Defendant.

* * * * * * * * *

[fol. 2851] Mr. Littman: If your Honor please, I would like to inquire of counsel for Panhandle Eastern Pipe Line Company whether they propose to make a claim here for going concern value separate and apart from reproduction cost?

The reason I ask that question is in order that I may know how to proceed with my cross-examination. I understand that Exhibit 38 has not been ruled upon by the Examiner.

I understand that Mr. Biddison made an estimate of going concern value based upon the data submitted by Witness Morton in Exhibit 38. Now, I would like to know upon the record whether counsel for Panhandle Eastern are claiming going concern value separately and apart from their reproduction cost estimates?

I think we are entitled to have that information before proceeding.

Mr. Wheat: Mr. Examiner, the company is offering its witnesses on facts now. We will make our contentions at what we deem to be the appropriate time, I assume. We have offered certain facts in respect to the cost of attaching business. Your Honor has ruled with respect to an exhibit which contained certain of those facts and we believe erroneously so ruled in respect, at least, to those facts.

I refer, of course, to Exhibits 39, 39-A. We intend, of course, at the appropriate time and when argument is provided on the matter of the rates of the company to make the appropriate contentions based upon facts which [fol. 2852] have been adduced in this record.

Trial Examiner: It is the recollection of the Trial Examiner that there has been some discussion in the record as to going concern value or the cost of developing business and it is also the Trial Examiner's recollection that counsel for the Commission have perhaps tentatively

expressed a doubt whether the cost of developing business is an inherent element in the presentation of the evidence of reproduction cost new.

Whether claim for going concern value or the cost of developing business would be relevant in the situation we have here, we will adhere to the historical cost or actual cost of the property. Is that a correct statement, Mr. Littman?

Mr. Littman: Perhaps I had better amplify my statement a little further in order to make my position clear.

I contended at the outset that all of this claim for going concern value was part and parcel of Mr. Biddison's reproduction cost estimate. He labels it as such in Exhibit 39. He calls it reproduction cost and, in his summary, he calls it fair value after depreciation.

Now, in his Exhibit 39, he clearly shows that this purported claim for going concern value which he labels clearly and definitely as reproduction cost is composed of three elements: First, a claim for "value of gas purchase contracts"; Secondly, a claim for so-called "cost of business development" which consisted of two items, one, [fol. 2853] "Payments to utility companies" and two, so-called "Carrying costs on that portion of plant idle pending the development of business."

Now, the last element, namely, "Carrying costs on that portion of the plant idle pending development of business" was a figure derived by Mr. Biddison from Mr. Morton's Exhibit 38.

That is, it was Exhibit 38 that formed the basis for the figure adopted by Mr. Biddison.

Now, it is my recollection that I inquired of Mr. Biddison during his direct testimony as to whether or not all of these costs were a part of his reproduction cost and he said they were and that being the case, we objected to it as a part of reproduction cost and your Honor has sustained that objection thus far to everything except the basic exhibit, namely, Exhibit 38.

Now, your Honor has stated in ruling on the objection to reproduction cost that counsel for Panhandle Eastern

Pipe Line Company would be given every opportunity to offer all evidence other than reproduction evidence and they might revise their exhibits and make a new proffer of evidence which, in their opinion, does not represent reproduction cost.

I say that we, at this time, have no objection whatever, and I want to be perfectly clear about this, to counsel of Panhandle Eastern Pipe Line Company coming forward, if they desire, with evidence of going concern value if it [fol. 2854] is not based upon reproduction cost and if it is not, in fact, reproduction cost; reserving, however, all of our rights to object to it on any other ground considered necessary and requisite at the time.

In other words, we invite counsel for Panhandle Eastern Pipe Line Company to offer and present any evidence that they may desire to present on the subject of going concern value which they claim is not reproduction cost.

If they wish to do that, of course, they are at liberty to do so. I want it distinctly understood that our objection heretofore made to this going concern value was because this witness labeled it reproduction cost and we assumed that he meant what he said. Moreover he testified that it was reproduction cost and your Honor rightfully excluded it.

Mr. Wheat: May I ask when he testified this was reproduction cost only?

Mr. Littman: That is my recollection of it and I shall produce the record reference of it after lunch or correct my statement if I am wrong.

Mr. Culton: He did not testify it could be used only in reproduction cost.

Mr. Littman: No.

Mr. Culton: He said it was an element that could be used in determining reproduction cost.

[fol. 2855] Mr. Littman: If I said it was only reproduction cost, then I mis-spoke myself.

Mr. Culton: You did not use the word "only" but that is an inference that could be drawn.

Mr. Littman: This is my recollection of what happened about a month or so ago. I asked him if it was a part and parcel of reproduction cost and he said it was.

Mr. Wheat: May we have that citation because we do not find that in our transcript.

Mr. Littman: I shall give you the page to which I have reference.

Mr. Culton: Page 560 is what I have. Your question was:

"And they represent real costs and actual money expended on the history of this plant rather than mere past losses?"

Mr. Littman: My question was that?

Mr. Wheat: I think that was my question.

Mr. Littman: I do not think I asked any such question as that.

Mr. Wheat: That was my question.

Mr. Culton: What he stated was those costs would be incurred in the reproduction of the property.

Mr. Littman: Yes, there was some inquiry by me that I had reference to.

Mr. Culton: This is what he testified to while he was on the stand also:

[fol. 2856] "They represent value because they are costs which would be incurred in the reproduction of this property, and they are costs which would be escaped by a purchaser who purchased the property with this business which has been attached by the expenditure of that money."

Mr. Wheat: And, of course, we shall, at the appropriate time, make such appropriate representation to the Commission as may properly appear from the facts which have been adduced on this record, whatever type of rate base they may apply to.

Mr. Littman: Well now, Commission counsel take this position: that counsel for Panhandle Eastern should make their position clear here.

They either want this going concern value or they do not. Now, if they want to sit idly by and claim that error has been committed on reproduction cost, I presume they are entitled to take that position. But if they are making any claim here for going concern value to be used in connection with an original cost is used as rate base or with a book cost rate base, separate and apart from reproduction cost, so far as we are concerned, they are at liberty to claim it.

Mr. Wheat: And the law will apply to those facts which are then shown in the record, Mr. Littman.

Mr. Littman: Well, you either want it or you do not, Mr. Wheat. You have not said you do.

Mr. Wheat: We have offered the testimony and it is in the record.

[fol. 2857] Mr. Littman: As a part of the reproduction cost. Do you want it separate and apart from reproduction cost?

Mr. Wheat: Mr. Littman, a witness in this proceeding offered a judgment with respect to this figure and that now appears of record and whether you are embarrassed by the fact that the entire Exhibit 39 and Exhibit 39-A have, upon your motion, been rejected, cannot now concern us.

The fact is we have offered this testimony and we intend to use this testimony as a basis for whatever claim may appear appropriate at the appropriate time. They are facts which we deem to be relevant to this entire proceeding and we suggest that if you have any question about this, you cross-examine Mr. Biddison upon the point.

Mr. Littman: My question, of course, has not been answered on the record.

Mr. Wheat: May I add, Mr. Littman, that it is our understanding that the item of going concern fits with any kind of rate base however it may primarily be developed.

Trial Examiner: This discussion is somewhat academic since there have been no objections stated to the proposed

Exhibit 38 which, I believe, was the basis for this discussion.

. . . . . .

[fol. 2864]

O. W. MORTON, a witness, having been previously duly sworn, was examined and testified further as follows:

Cross-Examination

. . . . . .

[fol. 2895] By Mr. Goodman:

Q. In the case of the Michigan Gas Transmission Company, you know that they built their line subsequent to the making of the Detroit contract and for the purpose of supplying its requirements, isn't that right?

A. That is my impression.

Q. So that when they made their investment and provided the capacity, they had an actual market already secured, is that right?

A. I believe that is correct.

Q. Yes, and what was the interval of time from the completion of their construction project to its attaining capacity use, do you know?

[fol. 2896] A. I do not recall that, Mr. Goodman.

Q. Well now, as an engineer, you would have some knowledge or judgment on that, wouldn't you? Well, Mr. Morton, for all substantial practical purposes, they reached substantial capacity use when the line was completed, isn't that so?

A. I do not know that.

Q. You do not. Well, you took, I take it, the situation shown in Column C as your standard for capacity use, didn't you? That is, referring to Exhibit 38?

A. No.

Q. You did not. Will you show me the distinction between what my question implies what you did and what you actually did do? A. I cannot do that.

Q. You cannot. Does your inability to do that arise out of failure to understand my question?

A. I do not believe that it is worded so that I can get your point, Mr. Goodman.

Q. I see. Now, if you will refer to Page 2 of your Exhibit 38, can you point out upon what basis you have predicated the attainment of capacity use?

A. The attainment of capacity use, I do not recall ever having used that phrase, Mr. Goodman, and I do not understand what you mean by it.

[fol. 2897] Q. I see. Well, you have developed certain figures which you have designated as percent of unused capacity, is that right? A. Correct.

Q. Now, what is the base of that percentage?

A. There are five methods shown on this sheet to which you refer.

Q. All right. Can you indicate to me what is the standard of reference used by you under any one method which you have used for the making of your determination of percent of unused capacity?

A. The standard of reference was what I termed in my testimony as the "loaded year".

Q. What year was that?

A. Which year was October 1, 1936, September 30, 1937, and the performance of that year is the standard to which we have referred the other periods shown in the study.

Q. That is what I thought.

Now, I made reference to Column E before on Page 1, but the figures in Column F would be more applicable, is that right? That is the year that you have in mind?

A. That is the period to which we have referred the other periods.

Q. October 1, 1936, to September 30, 1937?

A. Correct.

[fol. 2898] Q. That is your "loaded year." In other words, you have taken the performance of that year as the representative or standard of loaded capacity?

A. Yes, sir.

Q. Referring to the figures in Line 18, maximum line capacity, for your standard of reference, you have 125,000 M. c. f. which appears in Column F, is that right?

A. Correct.

Q. Now, the corresponding figure appearing in Column E is 80,000, isn't that so?

A. Correct.

Q. Now, as a matter of fact, if you had only a maximum capacity of 80,000 M. c. f. how then can you use 125,000 M. c. f. as a standard of comparison?

A. The 125,000 shown in Column F is the capacity of the main pipe line for the period October 1, 1936, September 30, 1937.

The figures shown in previous columns, that is, A, B, C, D and E, Line 18, 80,000 M. c. f. to be exact, was the capacity of the main line system of Panhandle Eastern Pipe Line Company for those periods shown in Columns A, B, C, D and E.

Q. Exactly, and so, as a matter of fact, if you had a maximum day up to 80,000 M. c. f. prior to September 30, 1936, you had substantially all of the capacity, that is, you had substantially all of the load that your capacity could [fol. 2899] accommodate, didn't you?

A. Under the existing conditions, yes.

Q. As a matter of fact, between January 1 and September 30, 1936, your maximum day was slightly greater than your maximum capacity, is that so?

A. Correct.

Q. In other words, it carried an over-load?

A. Correct.

Q. Yet the purport of your exhibit denies that you obtained maximum use up to September 30, 1936, isn't that so?

A. The purport of the exhibit does not carry with it the idea that the line was carrying all of the gas for which it was designed in that period.

Maybe I can explain it this way. I believe the point you are making, Mr. Goodman, is that since the capacity of the line was 80 million during those early years and since it carried a load of 82 million at one time, then it must have been fully loaded. That is the point that you are making and that is true, that it was fully loaded under the conditions at which it was operating, that is to say, with three compressor stations, but it was not carrying the load for which it had been designed, namely, a full complement of compressor stations and that total capacity being 125 million.

Q. What is the present capacity of the line?

A. The present capacity of the line is 250 million a [fol. 2900] day sales capacity.

Q Well, was the line designed for that?

A. The distinction which I think maybe we should make is that the line, as it stands today, is a looped line, whereas all of these comparisons were made by me on this exhibit, Exhibit 38, on the basis of the original single line.

Q. But as a matter of design, there is contemplated the ability to increase capacity, isn't there?

A. I believe that is correct.

Q. So that you cannot say that this line was in no sense designed for an ultimate capacity of 250 thousand M. c. f. per day, can you?

A. On the other hand, I cannot say that it was not designed as a single line.

Q. You know, as a matter of fact, that when the line was designed, was projected, it was designed in such a way that its capacity could be very substantially increased and increased considerably beyond 125 M. c. f. per day?

A. Now, you say it was designed in such a way that that could be done. Any single line can have its capacity increased by merely adding another line alongside it so that you could not say that this line was specifically designed to be expanded into two lines or three lines or four lines.

That is the inherent fact that goes with the construction of any single line.

[fol. 2901] Q. Well, at any rate, you then have taken as your standard of capacity the maximum performance of a single line, is that correct?

A. That is the basis for one of the five methods shown in Exhibit 38.

Q. Now, is all of the main transmission system looped?

A. No.

Q. It is not?

A. No.

Q. So that the capacity of 250 thousand M. c. f. does not arise merely by multiplying a single line capacity of 125 thousand M. c. f. by two at all, does it?

A. No, there is no relation there.

Q. So, as a matter of fact, this single line, in part, is accomodated to a capacity of 250 thousand M. c. f. per day, isn't it?

A. Not the single line.

Q. Not even in part?

A. The only thing it has a capacity of 250 million cubic feet a day is the combination of two lines with full power.

Q. Well, I asked you if your main transmission line was all looped and you said no.

A. Right.

Q. Does your main transmission line have a capacity [fol. 2902] of 250 thousand M. c. f. or is that capacity a total system capacity?

A. We have used the term indiscriminately. I think maybe you and I are drawing too fine a point as to what is the main line. Panhandle Eastern—

Q. (Interposing) Yes, I am wondering as to that. In other words, do you make up your 250 thousand M. c. f. capacity from more than one line?

A. Yes.

Q. You do. How many lines?

A. At the present time, that capacity is the capacity that goes with a single line plus a certain percentage of looping which has been accomplished to date together with ample powering and we, in our descriptions here, have referred to that as "the line."

Q. Now, I notice that on your various tests of capacity here you get variable figures, thus, according to your first method which you characterized as the volume method, you get for the year 1936 as percentage of unused capacity, 39.26.

For your second method, you get 44.5. For your third method you get 25.8. For your fourth method, 13.04, and for your fifth method, 21.95, all in terms of percent unused capacity.

Now, can you tell me of what particular use such wide [fol. 2903] variations are or, put it differently, what is the particular validity of any one method when you show another method which varies the percentage in wide latitude?

A. I have not attempted to defend one of these methods as against another. I have not attempted to translate the

results that you find here other than to state that, in my opinion, each one of the five methods shown constitutes a fair measure of the unused capacity of the system during the early periods before the pipe line had attained the load for which it had been designed.

Q. Do you mean that each method is equally defensible, is that right?

A. I cannot even say that. I merely say that we have here five different ways of doing the same thing.

Q. Now, Mr. Morton, are you familiar with the methods in general use in the gas business and in the power business for determining percent of unused capacity?

A. I was not aware that the art had developed to the point where you could say there [way] any method in general use.

Q. Did you know that in the power business, engineers generally computed it on the basis of relation of peak demand capacity?

A. I have some familiarity with that, yes.

Q. But you suggested other methods and excluded the simple relation of maximum demand capacity?

[fol. 2904] A. Yes, I made no such showing.

Q. Now, Mr. Morton, is your testimony concerning the time required to attain capacity output after completion of the pipe line, predicated upon speculative considerations or is it based upon the actual experience of the Panhandle Eastern Pipe Line Company?

A. I studied the performance and my study indicated to me that the actual experience of the company was such, during this loaded period, as to justify that period as a fair basis of comparison.

Q. Well, do you mean to offer this, that is, your testimony and your conclusion about it, as something predicated upon your experience with the company in the development of its business? Isn't that so?

A. Yes, this is closely related to my experience with the business.

Q. Now, your claim, Mr. Morton, that based upon your knowledge of the company's experience that it is just and reasonable to allow, in the present calculation of rates, for costs of carrying unused capacity?

A. That question goes to the use to which this exhibit is to be put?

Q. Not at all, not at all. That goes to your own qualifications here.

A. I have attempted to show here five different ways [fol. 2905] of doing this job and as to the translation of the results into the determination of those things that we have previously talked about in this rate case, I have no opinion.

Q. I see. In other words, as to the ultimate propriety of that situation, its prudence or its imprudence, its necessity or its lack of necessity, you express no opinion other than the statement that it just happened?

A. What was the last word you said?

. . . . . .

Q. Are you prepared, Mr. Morton, to vouch for the proposition that the failure to obtain capacity use within the time you have stated and as to which you have testified is a reasonably prudent and proper result or situation?

A. I have no opinion on that matter.

Q. You have no knowledge on that subject, have you?

A. No.

. . . . . .

[fol. 2906] Q. And you do not want your testimony to be construed as relating in any way to the necessity of this time lag, its reasonableness, its prudence, at all, do you?

A. That is correct.

Mr. Goodman: I move that the testimony of the witness in relation to Exhibit 38, predicating a going value, going concern value or supplying basic data for going concern value, be stricken or that the proffer of the exhibit in evidence be rejected because, although the showing is made of a time-lag between investment and the attainment of capacity use and of taxes, interest, operating expenses, being incurred within the period of time lag, there is no testimony in the record which in any sense justifies as reasonable and proper that such a situation should exist and evidence is not entitled to reception, as such, unless there is some reasonable justification for the situation presented.

For all that appears, the circumstance may and the inferences would be the result of a misconceived venture. We

do not know. There is nothing in the witness' testimony or in any testimony in relation hereto that brings it down to the point that it was reasonable, it was prudent, it was necessary to incur this time lag of which he predicates and upon which he predicates an allowance in rate base for the calculation of rates.

Mr. Littman: If your Honor please, we would like to [fol. 2907] join in the motion made by Mr. Goodman primarily for two reasons.

First, because this entire exhibit represents an attempt to capitalize past operating expenses, past ad valorem taxes and past interest payments. None of these charges were ever capitalized on the books of the company as appears from the face of this exhibit.

Moreover, there has been no showing whatever and I think this is of the utmost importance, there has been no showing whatever that this so-called purported cost attributable to unused capacity was necessarily incurred.

There is no explanation [so] to why it was incurred. No connection whatever has been brought into this proceeding which would tend, in any manner, to link these figures to the issues before us in this proceeding which are, of course, the question of the reasonableness of the rates.

What caused this unused capacity, what brought it about, the circumstances surrounding it, all those questions are unanswered. The burden of making a showing with respect to this exhibit is certainly not upon our shoulders or upon the shoulders of the Intervenors.

The burden is clearly upon Panhandle Eastern to make some showing which would tend to justify the inclusion in capital of these past operating expenses. No such showing has been made and I, therefore, submit the motion to strike this exhibit and all testimony made in connection with this [fol. 2908] exhibit should be sustained.

* * * * * * * * *

[fol. 2916] Cross-Examination

By Mr. Chamberlain:

* * * * * * * * *

[fol. 2928] O. W. MORTON, having been previously duly sworn, resumed the stand and testified as follows:

Cross-Examination (Continued)

* * * * * * * *

[fol. 2931] Q. Mr. Morton, do you know that in 1930 a contract was entered into by which Columbia Gas and Electric Corporation agreed to purchase of Panhandle Eastern Pipe Line Company their excess capacity up to 20 million cubic feet a day at 18 cents per thousand for such period as they had the excess capacity and later to buy the gas at 26½ cents?

A. I never knew anything or heard anything about that.

Q. Did you know that a demand was made upon your company for a contract against a purchase contract by Missouri Kansas Pipe Line Company seeking 20 million cubic feet of gas per day at 18 cents and that it was refused by your company?

A. I knew nothing of that.

* * * * * * * *

[fol. 2932] Q. You have presented an exhibit here in which you are showing what you believe to be the cost of the unused capacity in the Panhandle Eastern Pipe Line from the beginning of service in 1932 up to the time when the capacity was fully sold in 1937, have you not?

A. Yes, that is correct.

* * * * * * * *

[fol. 2933] Q. How did you come to prepare the exhibit?

A. Why, Mr. Biddison asked me if I would prepare for him the cost of carrying unused capacity on this pipe line.

* * * * * * * *

Q. Then you did propose a method of determining going value for this case, did you not?

[fol. 2934] A. In the early stages of our defense in this rate case, we discussed going value and I made some figures, but it was decided that I did not know enough about going value to present the thing.

Q. Well, you understand that your exhibit is directed toward obtaining an allowance in the rate base, did you not?

A. I have heard Mr. Biddison's testimony as to the use he made of these figures and I believe that that is approximately the use to which he put it from what I have heard him present here on this witness stand.

Q. That is the use you expected to be made of it, wasn't it, when you prepared it?

A. Yes, I thought Mr. Biddison would use it. I cannot say in that particular connection, however.

* * * * * * * *

[fol. 2935] Q. Let me ask you now to tell us — let me ask you first whether you ever made a study of rates for Fulton, Missouri?

A. I do not remember. I imagine that I did.

* * * * * * * *

[fol. 2936] Q. I wish you would state whether your company refused to sell gas to Fulton, Missouri, and, if so, what their reason was?

A. This is just from memory. I am not an officer of the company and I do not know the policies, but I do not mind telling you that I think that there was a matter that went up to the Supreme Court involving service to Fulton.

Trial Examiner: You mean the Supreme Court of Missouri?

The Witness: I believe it went to the Supreme Court of the United States, involving service to Fulton, in which it was said that Panhandle Eastern had refused service to Fulton, Missouri, but I still do not recall why. I do not know why.

By Mr. Chamberlain:

Q. Now, you read accounts of that in the papers, Mr. [fol. 2937] Morton, did you not?

A. Yes, there were things in the paper about that.

Q. And Fulton had to appeal first to the Missouri Public Service Commission, did they not, to get gas?

A. I am not sure, but I think they did.

Q. Then the matter went through the courts to the Supreme Court of Missouri, did it not?

A. I believe so, yes.

Q. And your company was finally compelled to serve them gas, was it not?

A. As I recall, they were not compelled to. There was a settlement of the matter before it was finally decided by the Courts and, in [order] words, the parties got together and we proceeded to give them gas then.

Q. Now, about what time did you proceed to give them gas?

A. I cannot remember the date it started. I cannot remember.

Q. It was many years after they had made their application for gas, was it not?

A. Yes, it was.

Q. And after there was some change in the management of your company?

A. I do not recall whether there was any change in the management in the interim or not.

[fol. 2938] Q. What do you recall about Fayetteville, wasn't there a Fayette, Missouri, or Fayetteville?

. . . . . .

The Witness: Fayette, Missouri.

. . . . . .

Q. Now, Mr. Morton, don't you know it to be a fact that your company refused service to these municipalities, saying that if was their policy not to sell to municipal distributing agencies?

A. Now, I do not know that.

Q. And do you not know that that was the matter at issue in the litigation in respect to Fulton, Missouri?

A. Yes, I know that.

. . . . . .

[fol. 2939] Q. Do you know of auditors of the Federal Trade Commission being in your offices for weeks gaining information for their examination?

A. I knew there were some auditors in our midst from a Federal agency or department, but I did not know which one.

[fol. 2940] Q. Did you not read, in your local papers, the results of the testimony taken in respect to your company and its relations with Columbia Gas and Electric Corporation.

A. Over the years, I have read all of that that has appeared in the newspapers on the subject, in our local papers, I mean.

Q. And did you not read the reports of the Federal Trade Commission which were in published form?

A. I do not recall.

. . . . . .

[fol. 2941] Q. Did you ever hear that Columbia Gas and Electric Corporation and their officers, Mr. Gossler, Mr. Reynolds and Mr. Monroe claimed there was a territorial allocation of the State of Indiana, whereby Panhandle had agreed not to sell gas to Missouri-Kansas Pipe Line Company for use north of a line which would extend east and west across the State of Indiana at Terre Haute?

A. No, sir.

. . . . . .

Q. Were you ever, at any time, called upon to make an estimate of the cost of service of gas prior to 1935 for any community in Indiana or Michigan north of a line which would extend east and west across the State from Terre Haute?

. . . . . .

[fol. 2942] The Witness. Not to my knowledge.

. . . . . .

Q. Now, did you know of a contract having been made late in 1931, for the service of gas to Columbia through Indiana Gas Transmission Company at the Indiana-Illinois State Line at 18 cents per thousand cubic feet?

A. Yes.

Q. You knew of that contract?

A. Yes, sir.

Q. Now, do I understand that you were not called upon to determine the cost of that service?

A. That is correct.

Q. That was determined by others than you?

A. Not by me, at any rate.

Q. Not by you. Now, do you know that Missouri-Kansas Pipe Line Company made a demand upon Panhandle Eastern for the service of gas at that point in 1931 and threat-

ened legal action against them if they would not sell it to them?

A. I know nothing of that.

Q. Did you not hear that Mr. Monroe said that he would not furnish it to them under any circumstances if they were to use it in Indianapolis?

A. I heard nothing like that.

Q. Were you ever called upon to make a study of the cost of service at Indianapolis?

[fol. 2943] A. Yes.

Q. When was that?

A. About two or three years ago.

Q. That was after 1935?

A. It was.

Q. And you were never called upon before that time?

A. I was not.

* * * * * * * * *

[fol. 2945] Q. Now, what, if any, studies did you make which were formal in the early years of your employment and which were used in fixing rates during the early years, 1931, '32, '33 and '34?

[fol. 2946] A. I cannot recall any studies that were put up in a formal way and were used in fixing rates.

* * * * * * * * *

[fol. 2947] Q. To try to get at the question a little more concretely, I call your attention to the fact that, in Illinois, you had a 40-cent city gate rate, did you not?

A. Very early, up to about 1933, as I recall it.

Q. Yes, I think that is right.

A. We had such a rate.

Q. Now, tell us how the gate rate of 40 cents for Illinois was determined and what part you had in that determination?

A. I had no part whatsoever in determining that rate, Mr. Chamberlain.

Q. That rate, then, was not based upon any cost study [fol. 2948] which you made which would indicate that that should be the rate, is that correct?

A. That is a correct statement.

Q. Now, let me ask if you did not read in the press dispatches in 1933 that the Illinois Commerce Commission

either annulled or refused to permit that rate to continue?

A. I do not recall that that is the circumstance surrounding the discontinuance of that rate, but I will go along with you to the extent that the rate was discontinued and probably on account of some objections that were made before the Illinois Commission, under whose jurisdiction we operated at that time.

Q. But your company maintained that gate rate until about 1933, did they not?

A. I think we had two gate rates until 1933, at which time we dropped the 40-cent one and, as I recall it now, the reason that was dropped was because the other one was cheaper and they preferred to take a newer rate which we had inaugurated in about 1931 or 1932.

. . . . . .

[fol. 2949] Q. Now, you had a 40-cent rate at the Indiana-Illinois Line, did you not?

A. I do not recall that.

. . . . . .

Q. You had an 18-cent rate, didn't you?

. . . . . .

The Witness: I remember that there was a contract and I testified a few minutes ago that I had some knowledge, however hazy it may be, that there was a contract between Panhandle Eastern and Columbia interests under the terms of which gas, under certain circumstances and having a certain degree of interruptibility, was available at 18 cents at the Indiana-Illinois State Line.

[fol. 2950] It is my recollection that that same contract called for 26-cent gas on a firm basis. It is a long time ago, and I never even reviewed these things before I came in here.

By Mr. Chamberlain:

Q. Now, tell us why your company did not sell gas to Lincoln, Illinois, for a period of years?

A. I do not know why the company did not sell gas to Lincoln.

. . . . . .

Q. You have no recollection whatever about the difficulty at Lincoln, Illinois?

A. Now, I have some recollection that there was some difficulty in connection with inaugurating natural gas service at Lincoln.

Q. And you know, do you not, that the company distributing gas at Lincoln offered to pay the full expense of the lateral line to serve Lincoln and yet they refused it?

[fol. 2951] A. No, sir, I do not know that.

Q. I wish you would search your memory about that.

A. No, I do not know that.

Q. How close is your main transmission line to the City of St. Louis?

A. I believe we go within 80 miles of St. Louis.

Q. And were you aware of the inquiry made by a special natural gas committee of the Board of Aldermen of the City of St. Louis early in 1935 in which they were making an inquiry into the question of obtaining adequate supply of natural gas for service in the City?

A. Yes, sir.

Q. And did you know that Mr. Bay was there as a witness? A. Yes, sir.

Q. And did you know that they made an application to him for a supply of gas which he declined to furnish?

A. I know that an application was made or at least they were discussing the subject. I do not know that the service was refused.

Q. You never made a connection with St. Louis, I take it? A. No, we did not.

Q. And the territory was then served by Mississippi River Fuel Corporation?

A. Another natural gas company, yes.

. . . . . .

[fol. 2952] Q. Did you hear of the offer that was made by the Phillips Petroleum Company to join with Mr. McNabb in building a line to connect your transmission line with St. Louis and asking for a supply of gas?

A. I remember that there was something like that in the wind at that time.

Q. Your company never made a connection?

A. No, we never made a connection.

Q. Were you ever called upon to make a study for the cost of your service to Emporia, Kansas?

A. I do not recall having been called upon to do so.

Q. Do you recall a demand by Emporia in 1932 for gas service? A. I do not.

Q. You do not recall its refusal? A. I do not.

Q. Were you aware of the filing of an antitrust suit by the United States Government against the Columbia Gas and Electric Corporation and certain of their officers, including Mr. Bay, in March of 1935?

A. Yes, sir.

Q. And did you know the charges that were made in [fol. 2953] that action with respect to stifling competition and attempting to wreck Panhandle Eastern so that its securities might be bought in by the Columbia people?

A. If the newspapers stated those things at the time, then I was aware of all of them.

Q. You knew Mr. Bay was a defendant in that case?

A. Yes, I did.

Q. Did you know later on it was settled? A. Yes.

Q. Did you know that Mr. Bay and, by the way, Mr. Bay was Vice-President of your company, was he not?

A. He was.

Q. Did you know that the receivers of Missouri-Kansas Pipe Line Company brought an action for some $180,000,000 [—] Columbia Gas and Electric Corporation, certain of its officers and Mr. Bay on a charge of having conspired to prevent the sale of gas by Panhandle Eastern and to prevent competition with the Columbia Company in Ohio?

* * * * * * * * *

The Witness: In general, I am familiar with all of that.

* * * * * * * * *

[fol. 2954] Q. Did you know of a request of your com-
[fol. 2955] pany for gas for Detroit by Mr. Reeser?

A. No, sir.

Q. In 1934? A. I never knew of him.

Q. Didn't you know of his meeting Mr. Neuner in Kansas City, seeking a supply of gas for Detroit?

A. I knew nothing of it.

Q. Do you know who he is? A. No, sir.

Q. Did you know of a request by Benedum Trees Company of Pittsburgh for gas for service in Detroit?

A. No, sir.

Q. Do you know anything of an application of J. W. Rice for service of gas to Detroit? A. No, sir.

Q. Do you know of any effort whatsoever that was made by officers of Panhandle Eastern to obtain a Detroit market prior to 1935?

A. I do not.

. . . . . .

[fol. 2956] Mr. Wheat: Mr. Examiner, on reviewing Exhibit 38, we have noted that the note at the bottom of Page 1 is erroneously stated. The note now reads:

"Includes only operating expenses that vary with M.c.f. sold."

I am informed that it should read:

"Excludes operating expenses that vary with M.c.f. sold."

I would like to ask Mr. Morton if that is true.

The Witness: That is correct.

. . . . . .

Trial Examiner: The original and official exhibit is not in the room at this time, so it will be necessary for us to remember this correction.

. . . . . .

By Mr. Chamberlain:

[fol. 2957] Q. Just one or two questions more, referring to Exhibit 38, Mr. Morton, I take it that you have deducted from your investment the investment in the Argos line and the Local Area, together with a portion of the line which was used for transportation?

A. That is correct.

Q. And by transportation, do you mean the transportation for others?

A. Yes, specifically gas transported for Northern Natural Gas Company.

Q. Now, in attempting to arrive at the value of the unused portion or the unused capacity, did you make any attempt to reconcile that with what will be a fair return upon the property?

A. Fair return did not enter into this study.

. . . . . .

[fol. 2959] Trial Examiner: In order that the record may be complete, I wonder if it would not be well, through this witness or some other witness or by statement of counsel, to include in this record some definition of the phrase "load factor" as used by this witness and at other points in the record already?

. . . . . .

The Witness: Load factor, as generally used, means the ratio of the maximum day to the average.

When we say "annual load factor", we mean the ratio between the maximum day and the average day for 365 days.

When we say "monthly load factor", we mean the ratio of the maximum day for that month as compared to the [fol. 2960] average day for that month.

I might add that it is a rather tricky term and that we should be pretty cautious about using it. It would be much better, in my opinion, if we would just say the relation or the ratio of the maximum day to the average day. It is more understandable to everyone, I believe.

Trial Examiner: When you use the phrase "load factor" with a prefix of a definite percentage, what significance does that indicate?

For instance, a 70-percent load factor?

The Witness: That means that the average day is 70 percent of the maximum day.

For example, if we sold one million cubic feet on the maximum day, and we sold an average of 700 thousand cubic feet on the average day, then the load factor would be 700 divided by a thousand, which is equal to .70 or, as we say, 70 percent.

It merely describes the relation between the average day to the maximum day.

Trial Examiner: Thank you.

By Mr. Chamberlain:

. . . . . .

Q. Now, I would suggest that, for the benefit of the [fol. 2961] record, Mr. Morton define what load factor is when applied to a contract such as that of the Panhandle with the Detroit City Gas Company?

A. That is just what I had in mind when I said that it is a tricky term.

Load factor, in my opinion, should not be used except just as I have stated it a while ago so very carefully. If we tried to talk about the load factor with relation to the Detroit contract or the load factor with relation to some other complicated situation, then we are really getting away from load factor and we are talking about something else entirely.

Load factor can only be just what I have said.

Now, we have misused it, all of us, so much that it is not uncommon at all for any of us to refer to the load factor erroneously, particularly in connection with the Detroit contract, but I think we could bring out the thing you have in mind much better by not tying load factor at all to the Detroit contract.

Q. Well, the contract itself provides for a load factor, does it not, provides a rate based upon load factor?

A. The contract provides a rate that fluctuates with the load factor of the base load as defined in that contract.

. . . . . .

[fol. 2962] Q. In other words, the load factor, as used, with respect to that contract, means the ratio of the average day of the year to the maximum day within the month of December, January, February and March, does it not?

A. That is a correct statement.

. . . . . .

[fol. 2963] Q. Let me suggest one more thing. You have in effect what is known as the 3 cent-4 cent rate for good load factor gas and bad load factor gas, do you not?

A. Yes, we have what is known as a 3- and 4-cent rate.

. . . . . .

Trial Examiner: I think Mr. Chamberlain used the phrases "good load factor" and "bad load factor",—did you not?

Mr. Chamberlain: Yes, I did.

Trial Examiner: I wonder if those phrases might not need defining?

The Witness: Now, if we want to talk about good load factor and bad load factor, which are relative terms as applied to the 3- and 4-cent rate, so called 3- and 4-cent [fol. 2964] rate, why, perhaps this will clear it up if I would say that we have offered in Indiana a rate which we call the 3 and the 4-cent rate and the 3-cent rate applies to all gas used during the months of June, July, August and September.

The 3-cent rate applies to the average quantity consumed during those four months for the balance of the eight months of the year and that gas we call "good load factor gas" because the consumption is fairly regular throughout the year.

It is a purely relative term. Then the remainder of the gas which is not sold at 3 cents is sold at 4 cents and that is the balance or the remainder of the gas and roughly, but only roughly, represents the house heating sales which are high in winter and low in summer and which, therefore, have a poor load factor.

By Mr. Chamberlain:

Q. Well, the gas sold under your schedule of rates for Indiana which is, as you say, a 3-cent-4 cent rate, is actually sold on a load factor basis, is it not?

A. Only in so far as the procedure I have described could be called a load factor basis.

Q. The good load factor gas comprises the gas sold in the four summer months and an equal amount sold in each of the eight other months?

A. That is right.

Q. In other words, your good load factor gas is 100 [fol. 2965] percent load factor, is it not?

A. No, it is not because, as I have defined load factor, it was, as I said, the ratio of the maximum day to the average day.

. . . . . .

Q. Yes, but if you will limit your consideration to the

equal take for each day of the year—let me change that—does it not comprehend that the monthly take of each month of the year shall be uniform in so far as the 3-cent portion applies?

A. Approximately, and I think maybe we can get this straightened out by my saying that the approximate load factor of the 3-cent gas is 100 percent.

Q. Then the rate of 4 cents applies to all gas which is [fol. 2966] taken at less than approximately 100 percent load factor?

A. Yes.

* * * * * * * *

Trial Examiner: While we have these definitions grouped, are there other technical terms, Mr. Morton, that are involved in the various contracts that will be considered in this hearing?

I have in mind one in particular and that is "interruptible gas" or "interruptible service."

Perhaps you have others, and I think that this is a good time to cover by definition the technical meaning of such terms.

The Witness: I cannot think of any except the one that you have mentioned, Mr. Examiner, and the term "interruptible" as it is used is, I might say, a loose term.

It is rather difficult of definition. I could only define it in a most general way. We think of "interruptible" as being gas, usually taken by industry, which can be interrupted in favor of the firm customers or domestic customers when the supply becomes limited through some cause or other.

* * * * * * * *

[fol. 2991] By Mr. Chamberlain:

Q. Mr. Morton, you deem it fundamental, then, in your business, that the increased sales would produce lower prices, or lower costs for your company?

[fol. 2992] A. That depends upon the load factor characteristics of the proposed loads that you speak of.

Q. Then, as your company increased its sales, would you expect a gradual reduction of revenue or increase in

A. Our unit rate has been about the same, year after year.

Q. That is, your average revenues?

A. Per M. c. f..

Q. What has been the fact as to your load factor? Has that improved or decreased?

A. I don't know which way it has gone, up or [done.]

Q. Well, it is certain that you have increased your sales every year since 1933, is it not?

A. That is correct.

Q. And is it not true that the average revenues which you have collected from the public have increased every year?

A. Which we have what?

Q. Average revennes per M. c. f. which you have collected from the public have increased every year, have they not?

A. The average rate has remained fairly constant. It may have increased slightly.

Q. Would you look at Exhibit 58 on Page 1 and refresh your recollection as to the average amount per M. c. f. received by your company since 1933?

A. In 1933 it was 21.08 according to this schedule, in [fol. 2993] 1934, 21.08; in 1935, 21.10; in 1936, 21.74; in 1937, 22.58; in 1938, 23.17; in 1939, 23.28; and in 1940, 23.35.

Q. Now, there has been an increase every year there since 1934, has there not, and that was the same as 1933?

A. There has been a slight increase.

. . . . . .

Q What was the amount of sales in 1933?

A Eleven billion plus.

Q. And in 1940 it was how much?

A. Fifty-six billion.

Q. And has there been a fairly uniform increase in sales during each of the intermediate years?

A. There has been an increase.

. . . . . .

Q. Now, one other question as to the sales in Indiana. [fol. 2994] Under the contract you mentioned, made at

the close of 1931, did you have more than one customer in Indiana for the years 1932, 1933, 1934 and 1935?

A. No.

Q. And who was that customer?

. . . . . .

The Witness: Indiana Gas Transmission Corporation.

. . . . . .

Q. And that was a subsidiary of Columbia Oil and Gasoline Corporation?

A. Yes, sir.

Q. Now, will you just make a quick computation and see if it was not a set 18 cent rate there for 1932, 1933, 1934 and 1935, which was the time prior to the filing of the ac-[fol. 2995] tion by the United States Government in the anti-trust case?

. . . . . .

The Witness: It appears to me from an inspection of this record that the average rate paid during those years, 1932 to 1935, inclusive, for sales to Indiana, was 18 cents per M. c. f.

Q. Now, let me ask you whether the sales to Michigan Gas Transmission Corporation are not included under the Michigan sales in Exhibit 59?

A. In Exhibit 59 it appears to me that the sales shown under the heading "Michigan" include only those sales made to Michigan Consolidated Gas Company and the Ann Arbor folks.

Q. Yes. Then, such sales as Michigan Gas Transmission makes in Indiana would be found in Column L under the title "Indiana"?

. . . . . .

[fol. 2996] The Witness: This is Mr. Watkins' Exhibit No. 59, and it appears from an examination of it by the witness that the figures you referred to were sales that were made by Panhandle Eastern Pipe Line Company to Michigan Gas Transmission Corporation for resale by the latter company in the State of Indiana.

. . . . . .

Q. Now, I wish you would make a quick computation as to the average revenues received for gas sales in Indiana which includes that sold to Indiana Gas Distribution Corporation and Michigan Gas Transmission Corporation for the year 1939.

A. On inspection of this Exhibit 59, it appears to me that the rate was approximately 20 cents plus.

* * * * * * * * *

[fol. 2997] Q. Then, will you state the average revenue received by your company from Michigan Gas Transmission Corporation for resale in Indiana for the year 1939?

[fol. 2998] A. It appears to be in excess of 20 cents per M. c. f.

Q. But less than 21?

A. Yes.

Q. What was the average revenue received for 1941 for the same thing?

A. Approximately 21.1 cents.

Q. And the Michigan Gas Transmission Corporation is a wholly-owned subsidiary of Columbia Gas and Electric Corporation?

A. I understand that it is.

Q. And you understand that rate to be for gas at the Indiana-Illinois State Line?

* * * * * * * * *

Mr. Chamberlain: I am asking for the average revenue received for M. c. f. of gas from the wholly-owned subsidiary of Columbia at the Indiana-Illinois State Line.

I understood you to say about 21.1 cents.

* * * * * * * * *

The Witness: From an inspection of Mr. Watkins' Exhibit 59, and dividing the revenue received by the M. c. f. sold, the unit rates which I have testified to appear to be the correct ones.

* * * * * * * * *

[fol. 3001] O. W. Morton, the witness upon the stand prior to the noon recess, resumed the stand and testified further as follows:

. . . . . .

[fol. 3003] Cross-Examination (Continued)

By Mr. Littman:

Q. Mr. Morton, do you have before you Exhibit No. 38?

[fol. 3004] A. Yes, sir.

. . . . . .

Q. When did you first commence your work on Exhibit 38?

A. I first commenced work on the general subject that is covered here in Exhibit 38 in July.

Q. Of 1941?

A. Of 1941.

. . . . . .

Q. Who requested that you commence the making of the study that eventually resulted in Exhibit 38?

A. The first information I had that there would be such an exhibit came in a meeting which was held, and at that meeting there were present all of the key men that you have known in this rate hearing, Mr. Neuner, Mr. Creveling, Mr. Wheat, Mr. Culton, Mr. Biddison and a few others.

That was in a meeting about July 25, 1941.

Q. It was at that meeting that it was decided that you were to commence your studies, is that correct?

A. Yes, sir.

Q. What instructions did you receive with respect to [fol. 3005] the making of this study?

A. At this original meeting about the only instruction I received was to post myself on the subject matter, to look into it and give it some thought and report back.

Q. What do you mean by the term "subject matter" as you used it in your last answer?

A. At that time, we were using the term "going value" or "going concern value" and that is the general subject matter that I was asked to look into at that time.

Q. That is, the term "going value" or "going concern value" was used during this conference to which you just alluded, was it not?

A. Yes.

. . . . . .

Q. How about other meetings? Did you have other meetings with these gentlemen?

A. Yes, later on we had other meetings at which we discussed the thing farther.

. . . . . .

[fol. 3006] Q. And what instructions did you receive at those meetings?

A. Well, it is difficult to state instructions received at each of the meetings but, after a series of them and after we had discussed what I knew about the subject, why, it was decided that possibly I had better not work up going value for the company at all.

It was decided that maybe I had better talk to Mr. Biddison on the subject and he seemed to have a better grasp of what was wanted and so I stopped working on my own initiative.

Q. And when was that?

A. That must have been two weeks after the date that I started, say, maybe early August.

Q. And it was about that time that you then had a talk with Mr. Biddison about what you were to do?

A. I might say that it was not the first talk but it was about that time that it was definitely decided by the management that possibly my general information on this subject was not as good as it should be and that, therefore, I had best talk to Mr. Biddison about it.

Q. Now, you had prepared some studies up to the time that this decision was made, had you not?

[fol. 3007] A. I had done some work. I do not know whether you would call them studies or not.

Q. Were they in writing?

Did you finish your answer, Mr. Morton? I am sorry to have interrupted you.

A. Yes, I had finished.

Yes, I had made some rought calculations and these I had discussed with the management from those rough

calculations and I think it was at that time that it was decided that maybe I had better talk to Mr. Biddison.

Q. Did those rough calculations look anything at all like what you now have in Exhibit 38? Were they similar studies?

A. Well, yes, they were along the same general line.

Q. Well, at any rate, it was decided, as you stated, that you were to carry on your work under the supervision or direction of Mr. Biddison, is that generally correct?

A. In general, that is true.

Q. Now, what instructions did you receive from Mr. Biddison? I am now speaking about the time that or shortly after it was decided that Mr. Biddison was to take charge of this subject?

A. Well, I showed Mr. Biddison what my ideas were, and he told me he thought that, in general, I was getting along pretty well and he offered some suggestions, told me how he thought it should be done and his instructions [fol. 3008] were not specific but, in general, he outlined the five methods that we show here in Exhibit 38.

. . . . . .

Q. I am not asking you to repeat word for word, Mr. Morton; that would, of course, be impossible, but I want you to give us your best recollection, generally, of what he said and what you said about the five methods.

A. Well, I cannot tell you just how Mr. Biddison put it. We had a conference and, as I say, he looked over what I had done and he offered suggestions as to what should be done.

I remember specifically that we were talking about how to make eliminations. I had not cleared up my mind as to how some of these things should be eliminated from this study, some of the things that are not involved in the study, how we would eliminate them from our figures and he offered some advice in that connection but, other than that, [fol. 3009] I do not believe I can reproduce our conversation.

Q. Well, was the term "going concern value" or "going value" mentioned in your conversation with Mr. Biddison?

A. I do not recall whether he used the words "going concern value" or "going value." He may have used the

term but, by that time, we were using a term, in so far as my work was concerned here, as the cost of carrying unused capacity on the line, on the main line. I know that he did use that term.

Q. But you are not sure whether he used the term "going value" or "going concern value"?

A. No, I do not know whether he applied that term or not to what we were doing.

Q. When was the decision made as to who was going to testify with respect to Exhibit 38, and with respect to any figures to be derived from Exhibit 38?

A. Well, I have named the date when we started and I have named the date when Mr. Biddison and I had our talk and undoubtedly, between those two dates, July 25 when I was given the general rough assignment and August, the early part of August, 8th, 9th, 10th, somewhere along in there, it was decided that Mr. Biddison was the man that knew more about this than I did and, therefore, should be the one to present the matter.

Q. Well, I am afraid you are going to have to be a little more specific.

Will you please turn to Page 1 of Exhibit 38? Looking at [fol. 3010] the figure shown in Line 2 called "investment total," did Mr. Biddison tell you to get those figures and put them in an exhibit?

A. No.

Q. You did that on your own responsibility, so to speak?

A. Yes.

Q. Would the same answer apply to the figures shown in Line 4?

A. Yes.

Q. Would the same answer apply to all of the rest of the figures shown on that page?

A. Yes, these are all basic statistics used in developing this mathematical study of mine and I assembled those figures after I had received my initial instruction from the company to look into this matter.

Q. Did Mr. Biddison instruct you to use the figures precisely as you have used them on Page 1 of Exhibit 38?

A. If you mean by that, did Mr. Biddison outline step by step what I was to do, I will say no, that, in general, he

indicated that this method was satisfactory and offered suggestions in the development of the figures.

Q. He did not tell you precisely what figure to use for this, that, or the other item that appears on Page 1 of Exhibit 38?

A. No, he allowed me quite a bit of lee-way. He asked [fol. 3011] me to develop this story here and gave me general advice on its development.

. . . . . .

[fol. 3012] Q. But the figures that you used were submitted to Mr. Biddison for his approval, is that correct?

A. That is correct.

Q. And the figures finally used on Page 1 of Exhibit 38 did meet with his approval?

A. Absolutely.

Q. Were any of the figures originally submitted by [fol. 3013] you to Mr. Biddison for Page 1 of Exhibit 38 changed by reason of any suggestion of Mr. Biddison's?

A. At some times, there was some change that Mr. Biddison suggested.

. . . . . .

Q. Well then, were the figures changed by you in accordance with his expressed desire in the matter?

A. They were either changed by me or else set up by me in accordance with his expressed desire. I cannot recall whether some figure at some stage of the game was prepared and then handed to Mr. Biddison and then he suggested a change and handed it back to me, or whether I gave him a general outline of what I was doing and he suggested a method of doing it.

Q. Well, when you completed Page 1 of Exhibit 38 at last and then had it reproduced as it now appears, I take it you and Mr. Biddison were in hearty agreement as to the figures appearing on that page?

A. Yes, sir.

Q. Now, let's turn to Page 2 of Exhibit 38. Here you show "Five Different Methods of Calculating Interest, Ad Valorem Taxes and Operating Expense"—should not that be "Expenses," plural, or doesn't it make any difference? [fol. 3014] A. I do not know that there is much choice. You can make it either way, as far as I am concerned.

Q. (Continuing) "And Operating Expense Attributable to Unused Capacity."

Now, who conceived these five methods?

A. These five methods did not just spring out of one man's head. The generalissimo, the motivating men behind these five methods is Mr. Biddison, but these methods were discussed with me, I think Mr. Neuner, they were discussed with him and so you could not say that they sprung into being from out of my head but I do think, as I say, the motivating force behind them is Mr. Biddison.

* * * * * * * *

[fol. 3015] Q. What about the last two shown on Page 2 from Lines 42 to 51, inclusive?

A. You probably recognize those as being gotten up by somebody who had read the Chicago Case. I read the testimony on the Chicago Case and those two methods are pretty close to the two that you may find in that other.

Mr. Gorman: Is that the Chicago District Electric Generating Case?

The Witness: No.

Mr. Gorman: It is Natural Gas Pipe Line of America?

The Witness: Natural Gas Pipe Line, yes.

By Mr. Littman:

Q. Who told you to read that case and submit the latter two methods?

A. As I said before, we had what I choose to call a council of war about July 25 and at that council of war the management outlined the part that each would play in this as they saw it at that time, subject to revision, of course, and it was at that time I was given the assignment of looking into this general subject and finding out what I could about it and it was from instructions received at that meeting that my reading of that Chicago Case developed.

* * * * * * * *

[fol. 3016] Q. Well, you recognized, did you not, while you were in the course of preparing Exhibit 38, that it was to be used in this proceeding as a basis for a claim for going concern value?

A. At one time, I thought that was what it was but, as I say, I apparently was not an expert at that thing and so they figured they had better turn it over to somebody else that knew more about it.

I suspected, or rather I knew, what I was doing here would be used as one of the elements of so-called "going value."

Q. You prepared this study for the purpose of furnishing the data to Mr. Biddison which was to form a basis of his testimony on that element of going concern value?

A. Yes.

Q. Of course, you said you read the Chicago Case rather early in your work in this connection, did you not?

A. Yes, I did.

Q. And the Court in that case did use, I believe, the [fol. 3017] term "going value" or "going concern value", did it not?

A. I believe that is what they called it when they presented it in that case.

Q. So that you were not in the dark on the purpose, generally, to which this exhibit was to be put?

A. That is correct.

Q. As a matter of fact, Mr. Morton, in order to make an intelligent study on the subject at all, you would want to know the purpose to which the exhibit was going to be put, wouldn't you?

A. Yes.

Q. Now, as I understand your Exhibit No. 38, you have undertaken to compute the interest, ad valorem taxes and operating expenses attributable to unused capacity by five different methods, is that correct?

A. That is it.

Q. And those five different methods and the conclusions with respect to each of those five different methods appear, do they not, on Page 2 of Exhibit 38, in Column G?

A. That is correct.

Q. Now, under the first method, you arrived at the conclusion that the amount of interest, ad valorem taxes and operating expenses, attributable to unused capacity was $6,465,590?

A. Yes, sir.

Q. And by the second method, $6,680,062, is that cor- [fol. 3018] rect? A. Yes, sir.

Q. And so on to the bottom of Column G?

A. Yes, sir.

Q. Now, without going into detail at this time, is there any amount included in any of the figures shown in Column G, other than (1) past operating expenses; (2) past interest, and (3) past ad valorem taxes?

A. I do not think there is.

Q. In other words, my statement to the effect that the amounts shown in Column G include only those three types of items is correct?

A. That is correct.

Q. They do not include a dollar of any capital expenditure, do they?

A. That is correct.

Q. And it follows, does it not, naturally, that the company has never, itself, capitalized any of the amounts of any part of the amounts shown in Column G on Page 2 of Exhibit 38?

A. I am not sure that in our bookkeeping procedure at some stage of our development or at some time during all of these years, I am not sure that some of these dollars were not accounted for by the accountants as capital or charged to capital investment, I believe is the term.

Q. If there are such instances, would they be rather [fol. 3019] minor, in your opinion?

A. I hesitate to answer that in either way because of this sort of thing that is running through my mind, and you can appreciate it.

I do know, from hearsay, I do not know it but I understand that in the early days of this company everything was capitalized.

Mr. Culton: May I remind you this first column only starts with April 1, 1932, and that was the date of the capitalization.

We concede that your question is correct, Mr. Littman, from the company's standpoint. We concede that the answer to your question should be yes.

Mr. Littman: Yes, Mr. Culton. I am earnestly endeavoring—

Mr. Culton: (Interposing) I knew you were, that is why I said what I did.

Mr. Littman: (Continuing)—To ascertain that my understanding of these figures is correct.

Mr. Culton: We are willing to stipulate that April 1, 1932, was the date of capitalization and is the time they capitalized for business operation.

Mr. Littman: I can appreciate the witness' caution with respect to the figures back in the early years. We are not concerned here with those.

[fol. 3020] The Witness: That is right.

By Mr. Littman:

Q. What do you mean by the term "attributable to unused capacity"?

A. That is just my choice of words, Mr. Littman. I believe that you can as easily say, "operating expense incurred on account of" or rather, to make the complete statement—"five different methods of calculating interest, ad valorem taxes and operating expense incurred on account of or as a result of there being in this system in the early days some unused capacity."

Q. And I take it that it is your testimony that the amounts shown in Column G of Exhibit 38 represent the interest, ad valorem taxes and operating expenses properly attributable to unused capacity?

A. Those are results that come about from an engineering calculation. When you say "properly attributable to unused capacity", I think that you have asked the witness to go beyond the exhibit here.

They are merely the figures that result from an engineering calculation of these things, as I see them.

Q. Mr. Morton, if Column G includes expenses, for instance, that are not properly attributable to unused capacity, they should be excluded, should they not?

A. Well now, if you are asking me whether I think the [fol. 3021] figures that have been submitted by Mr. Biddison are properly attributable to unused capacity, I do not believe I should attempt to answer that.

Maybe we can get on better if I just tell you that those are my calculations over there (indicating), on the book of rules as laid down here which are plainly stated

of the operating expense, ad valorem taxes and interest attributable to unused capacity.

Q. You are then not willing to testify, Mr. Morton, that the operating expenses, interest and ad valorem taxes included in Column G are properly attributable to unused capacity?

A. What is "properly"?

Q. What do you understand the word "properly" to mean or "proper" to mean?

A. Isn't it enough, Mr. Littman, when I tell you that that, in my opinion, represents the interest, ad valorem taxes, operating expense attributable to unused capacity?

Q. Attributable to such an extent that they should be included for purposes of this proceeding?

A. Now, again, you are asking me to go beyond the story I have here.

Q. Well, in your opinion, are these expenses, ad valorem taxes and interest amounts which are included in Column G all attributable to unused capacity?

A. Yes.

[fol. 3022] Q. And I take it by that answer you mean that they all have something to do with and have a direct relationship to the unused capacity of the system in the periods shown by you in Exhibit 38, of course?

A. Yes, that is true.

Q. Now, you used the term "unused capacity". To what are you referring when you use the term "unused capacity", the entire Panhandle Eastern Pipe Line system or some part of it or what?

A. I am referring to that capacity that was built in the main line of the Panhandle Eastern Pipe Line Company and was there prior to the time the line became loaded to a degree somewhat approximating that for which it was designed.

Q. You are a rate engineer, are you not, Mr. Morton?

A. Yes, I am.

Q. In your opinion as a rate engineer, should the amounts shown in Column G under any one or under any combination of the five methods in your opinion, be included in a rate base for purposes of determining reasonable rates?

A. I have no opinion about that.

Q. So that we may have no mistake about this, I want to make certain that my understanding is correct, that, in your judgment, every dollar shown in Column G has a relationship to, and a connection with, the unused capacity of the Panhandle Eastern Pipe Line system for the [fol. 3023] period shown in your exhibit?

A. If you add the words "main line", the answer is "yes."

Q. I am perfectly willing to add the words "main line".

Now, in order that we may make certain of the mechanics of your exhibit, I am correct in stating, am I not, that the amounts shown in Column G are parts of the larger amounts of interest, ad valorem taxes and operating expenses which are shown at the foot of Page 1 in Line 26?

A. They are.

Q. That is to say, if you added up all of the figures shown in Line 26 of Exhibit 38 at the bottom of Page 1, you would then have all of the interest, ad valorem taxes and operating expenses for the 4-½ year period from April 1, 1932, to September 30, 1936, inclusive, with some minor exceptions which are shown clearly on your Page 1?

A. I believe that is true.

Q. You appreciate that I am trying to get the philosophy of this exhibit rather than to bog down the record with details at the moment, Mr. Morton.

A. All right.

Q. According to my calculations—you correct me later if you wish, if I should be wrong—the total amount shown in Line 26, if you added all the items, would come to $9,793,173. Is that your general understanding of it?

[fol. 3024] A. Were you adding the sum of those figures shown on Line 26?

Q. Yes, sir. A. All right.

Q. Now, your figures shown in Column G represent an allocation or a portion of that $9,793,000 figure which I just read, based upon a percentage of so-called unused capacity in the years shown, is it not?

A. I believe that is correct.

Q. Generally, and omitting details, if the unused capacity by one of your methods were to be over the 4-½

year period, let us say, 50 percent, then you would simply take 50 percent of the $9,793,000 figure and transfer it over to Column G, is that generally the situation?

A. That is generally so.

Q. I am not holding you strictly to these percentages. They are assumptions purely for the purpose of short-cutting the method and getting it on the record.

A. All right.

Q. Now, were the amounts of interest, taxes and operating expenses which are shown in Exhibit 38 incurred by Panhandle Eastern Pipe Line Company and Illinois Natural Gas Company only?

A. The title of this indicates that it is Panhandle Eastern Pipe Line Company and subsidiary companies.

[fol. 3025] Q. Of course, we have had some difficulty with that before, Mr. Morton, so I would appreciate it if you would tell us what other companies are included.

A. Yes. Some figures from the Central Distributing Company undoubtedly are in there.

Some figures from the Texas Interstate Company are undoubtedly in there because we see here, from the title, that we have tackled this from the standpoint of Panhandle Eastern Pipe Line Company and subsidiary companies.

I might say the amount is very small from any of those other companies, aside from Panhandle Eastern and Illinois Natural Gas Company, which, at that time, was Panhandle Illinois Pipe Line Company.

Q. Now, did you mention Central Distributing Company? A. Yes, I did.

Q. When was that company incorporated?

A. Central Distributing Company is only three or four years old, but its predecessor was the Central States Gas Utilities Company and that was one of the subsidiaries of Panhandle Eastern, since its beginning, as I recall, since very early days.

Q. When was Central Distributing Company dissolved?

A. I believe it was July 1, 1937—correction—I believe the Central States Gas Utilities Company became the Central Distributing Company on July 1, 1937 or 1938.

. . . . . .

[fol. 3026] Q. Mr. Morton, did you want to make a statement with respect to unused capacity or your definition of that term?

A. Yes. During the recess it was called to my attention that it sounded as though I did not feel that the figures shown in Column G, Page 2 of Exhibit 38 were properly attributable to unused capacity.

I understood the question to be whether or not these figures were properly includable in the rate base and I did not wish to testify as to the propriety of their inclusion in the rate base but I did, however, intend to convey the idea that I felt they were properly attributable to unused capacity.

Q. Have you ever used the figures shown in Exhibit 38 or similar figures in preparing rate schedules for the company?

A. No.

Q. Just before the recess, we were discussing the names of the subsidiary companies and the subsidiary companies themselves which were included in Exhibit 38 or, perhaps, [fol. 3027] stated another way, we were discussing the subsidiary companies of Panhandle Eastern Pipe Line Company whose operating expenses, taxes and interest were included in the figure shown in Exhibit 38.

I would like at this time, for the purpose of facilitating this cross-examination, to have marked for identification with the next exhibit number a document submitted to Commission's counsel by Mr. Watkins in response to an inquiry addressed to Mr. Watkins when he was on the stand in direct examination.

This exhibit is entitled, "Panhandle Eastern Pipe Line Company and subsidiary companies—table to subsidiary companies of Panhandle Eastern Pipe Line Company."

Attached to this exhibit are the following schedules which I would like to have marked as Schedules 2 and 3, respectively, and to have the first page of the exhibit marked as Schedule 1.

I will read the title on the next two schedules. Schedule 2 has the following heading: "Subsidiary Companies of Panhandle Eastern Pipe Line Company Included with

Panhandle Eastern Pipe Line Company in Consolidation; Balance Sheet Per Books, Earned Surplus Per Books, Capital Surplus Per Books—Gas Plant"; and Schedule 3 headed as follows: "Subsidiary Companies of Panhandle Eastern Pipe Line Company Included with Panhandle Eastern Pipe Line Company in Consolidation Statement of Gas Produced."

I will ask, Mr. Examiner, that this exhibit be given a [fol. 3028] number and that the three pages be marked Schedules 1, 2, and 3.

* * * * * * * * *

(The Document Referred to was Marked Exhibit No. 112 for Identification.)

* * * * * * *

By Mr. Littman:

Q. Now, on the first page of Exhibit 112, Mr. Morton, which is called Schedule 1, Mr. Watkins shows the names of subsidiary companies, their dates of incorporation, and their dates of dissolution.

Now, would you mind reading into the record the names, date of incorporation and dates of dissolution of those subsidiaries of Panhandle Eastern Pipe Line Company whose interest, ad valorem taxes and operating expenses are included in your Exhibit 38?

A. This study has been prepared on a consolidated basis—

Q. (Interposing) By "this study", you mean Exhibit 38?

[fol. 3029] A. Yes. Exhibit 38 has been prepared on a consolidated basis for convenience and such of these companies as were existing at the date shown in the studies were included.

Q. And those dates included in the studies are April 1, 1932 to September 30, 1936, as shown in Columns A to E, inclusive, on Page 1 of Exhibit 38?

A. Correct.

Q. Well now, with that statement, would you mind reading the names of those companies which you believe to be included in your study in Exhibit 38?

A. I believe the following companies' statistics are included in Exhibit 38:

Central Distributing Company;

Central Pipe Line Company;

Central States Gas Utilities Company;

Illinois Natural Gas Company;

Macon Gas & Electric Light Company;

Missouri-Kansas Gas Company;

Panhandle Illinois Pipe Line Company;

Texas Interstate Pipe Line Company.

Q. Now, the dates of incorporation of each of those companies and the dates of dissolution of each of those companies appears in Exhibit 112, but I think, at this point, it might be well to read those dates into the record for each of those companies so that we may know what [fol. 3030] years' figures are included in your Exhibit 38.

A. The date of incorporation of the companies:

Central Distributing Company—November 17, 1934;

Central Pipe Line Company—August 25, 1933;

Central States Gas Utilities—August 15, 1928;

Illinois Natural Gas Company—

I would like to correct the record to the extent that I do not believe any Illinois Natural Gas Company figures appear in it, since it was not incorporated until 1938.

Q. Yes, that would be true, and that would naturally follow, wouldn't it, because your study does not go beyond September 30, 1936, in so far as amounts attributable to unused capacity are concerned, is that correct?

A. Correct.

And the dates of incorporation:

Macon Gas & Electric Light Company—January 25, 1888;

Missouri-Kansas Gas Company—June 27, 1928;

Panhandle Illinois Pipe Line Company—August 16, 1930;

Texas Interstate Pipe Line Company—February 12, 1930.

The dates of dissolution: Central Distributing Company, referring to a footnote on Schedule 1, Exhibit 112, indicates the date of dissolution of Central Distributing Company as follows: In January, 1941, Panhandle Eastern Pipe Line Company distributed to its stockholders the [fol. 3031] common stock of Central Distributing Company in payment of a dividend.

Continuing with dates of dissolution of the various companies:

Central Pipe Line Company—November 26, 1937;

Central States Gas Utilities Company—April 15, 1935;

Macon Gas & Electric Light Company—March 18, 1938;

Missouri-Kansas Gas Company—October 11, 1935;

Panhandle Illinois Pipe Line Company—July 30, 1938;

Texas Interstate Pipe Line Company—October 31, 1936.

Q. How long have you been employed by Panhandle Eastern Pipe Line Company? A. Since 1931.

Q. You are no doubt familiar with the companies whose names you have read, are you not? A. Yes, I am.

Q. Now, what was the business of Central Distributing Company?

A. They are a distributing company, as the name indicates. They receive their gas at the city gates and distribute it to their various retail customers.

Q. Now, Panhandle Eastern Pipe Line Company no [fol. 3032] longer owns that company, does it?

A. That is true.

Q. Do you know how many cities Central Distributing Company served, let's say, during the 4½ years of your study from April 1, 1932, to September 30, 1936?

A. Central Distributing Company served several small towns in Kansas and Missouri, approximately twenty in number. The total number of customers was about 3,500 at that time.

Q. Now, can you state the nature of the business conducted by Central Pipe Line Company during the 4½ year period that you used in your study?

A. No, I cannot. I have some general knowledge of it but I cannot state the exact business of it.

Q. Do you have any general recollection of the type of business in which it was engaged?

A. It was a separate corporation set up in Illinois for the purpose of owning a certain lateral line, as I recall it.

Q. Do you remember where the lateral line began and where it ended?

A. I believe that it was the Hoopston lateral in eastern Illinois.

Q. Now, what was the nature of the business carried on by Central States Gas Utilities Company during the 4½ year period?

[fol. 3033] A. They were the predecessor of the Central Distributing Company and carried on a distributing business.

Q. How many communities did you say were served by Central States Gas Utilities Company and the predecessor, Central Distributing Company?

A. I said about twenty.

Q. Would it be more accurate to say that those companies served 16 communities in Kansas and 13 communities in Missouri?

A. I had in mind the number served from the main line only. Apparently yours includes Local Area too.

Q. How many retail customers were served by those companies?

A. I said about 3,500, but I think now it is nearer 3,000. Of course, it varied over the years, beginning the period with, say 2,000 and ending the period with 3,500.

Q. Now, we might go to Macon Gas & Electric Light Company. What was the nature of the business carried on by that company?

A. They had a little manufactured gas plant up at Macon, Missouri.

Q. They manufactured gas? A. Yes, sir.

Q. Did they manufacture any electricity? Their name seems to indicate they might.

A. It is a misnomer; they did not.

[fol. 3034] Q. Do you know the population of Macon, approximately? A. Four thousand.

Q. Now, the Missouri-Kansas Gas Company, what was the nature of its business during the 4½ year period?

A. I believe it was a small gas production company in the Local Area.

Q. You are now referring to the Local Area that has been heretofore described in this proceeding as an area in Missouri and Kansas and in the vicinity of Kansas City, Missouri?

A. Correct.

Q. Now, the Texas Interstate Pipe Line Company, will you give us some information with respect to the operations of that company?

A. That was the producing company of the Panhandle system in the Hugoton and Amarillo fields.

Q. Now, referring again to Column G, of Page 2 of Exhibit 38, do not the figures in that column include the costs of manufacturing artificial gas which were incurred by Macon Gas & Electric Light Company during the period from April 1, 1932, through September 30, 1936?

A. I think an infinitesimal amount is included in that column as you have described it.

Q. What do you mean by "an infinitesimal amount"?

A. In respect to the total figures which we are dealing, these subsidiaries that were included in the study we are [fol. 3035] discussing here were very, very small.

Q. When does an amount become infinitesimal and when does it cease to become infinitesimal in dollars, in your opinion?

A. Now, that is very difficult to answer because no one knows. It is a relative term.

Q. You see, Mr. Morton, that is why I asked for your definition. My idea of infinitesimal may be different from yours and I wondered what you meant by it.

A. I am afraid I would not be able to give you a definition of what constitutes a very small part which we call an infinitesimal amount, but I am repeating again the amounts included in this study that go with those companies that you believe should be excluded are very small in respect to the total.

Q. What product did Macon Gas & Electric Light Company use for the purpose of manufacturing artificial gas? Was it coal?

A. Yes, they used coal and enriched it with oil.

Q. Now, will you explain how the cost of that coal and oil from which artificial gas was manufactured could be considered an operating expense attributable to unused capacity of this pipe line, Mr. Morton?

A. If we are going to analyze this thing down to that point, Mr. Littman, we will be here a long, long time, be-
[fol. 3036] cause this did not purport to be anything except an engineering calculation based upon the statistics of the company.

Now, to answer your question specifically, there is no way that I know of that you can say that the oil and coal as used up a Macon should enter into that figure and I would like to add that it does not affect it one way or the other very much.

Q. Even if there was a dollar's worth in there, it ought to go out, shouldn't it?

A. Not in my mind, my conception of the problem, Mr. Littman. As we conceived this, we started out here to find out how much of the interest, ad valorem taxes, operating expense was attributable to unused capacity in the main line system of Panhandle Eastern Pipe Line Company and its subsidiaries which were principally Panhandle Illinois Pipe Line Company and the Texas Interstate Company, a producing company.

It is just a question of my conception of the problem.

Q. Does your conception of the problem embrace the inclusion in operating expenses attributable to unused capacity of a natural gas pipe line the cost of buying coal and oil with which to manufacture manufactured gas in Macon?

A. I was treating this project as a whole. Specifically, that small item, I can offer no particular reason for including that small item except to say that I was treating this problem in its broader aspects, such as this: I have
[fol. 3037] dropped points after the decimal. Many of my calculations have not been, if you will notice, carried out to the cents. They are to the even dollars.

A matter of judgment enters into this thing. It was my judgment that it was entirely proper to include all of those little companies.

Q. Now, will you answer my question, please, Mr. Morton? I think you may have forgotten the original question and I think it can be answered yes or no.

. . . . . .

The Witness: Since that expense was a part of the total expense of operating this project and since I included the expenses as a whole, I did not feel it necessary or proper to go to the detail of eliminating it.

By Mr. Littman:

Q. You did not bother to eliminate it?

A. That is correct.

Q. But you did bother to make certain eliminations, did you not, Mr. Morton?

A. Certain eliminations were made.

Q. All right. Suppose you tell us about the eliminations that you bother to make? Let's look at Page 1.

A. I selected what I thought were the pertinent and important eliminations and I did not try to make small eliminations that I felt would not greatly affect the answer. [fol. 3038] Q. Well, we will get to the question shortly of how large or how small these are, Mr. Morton, but for the time being, you want to leave those costs of buying coal and oil for the purpose of manufacturing artificial gas in your study?

A. Yes, that is all right.

Q. Now, how about the cost of reading meters in these various communities served in Missouri and Kansas by the Central States Gas Utilities Company?

Are the expenses of reading those meters in here too, in your Exhibit 38?

A. The expense of reading those meters is in Exhibit 38.

Q. How about the cost of advertising for new customers in those communities? Is that included?

A. Yes, sir.

Q. How about the cost of repairing a leak in a gas main or in a service line in one of these communities, in Missouri or Kansas, which was served by Central States Gas Utilities Company?

Are such costs also included in your total in Column G as "attributable to unused capacity"?

A. There are.

Q. What of the cost of billing these distribution customers by the companies that you named? Are those costs included in your Column G for the 4½ year period which you used as the "not loaded" period?

[fol. 3039] A. Yes, they are included.

Q. Should they be included? Should all of these expenses which I just enumerated be included in your totals in Column G as expenses "attributable to unused capacity" of Panhandle Eastern Pipe Line system?

A. Since those expenses formed a part of the operating expenses of the Panhandle Eastern Pipe Line Company and subsidiary companies, I believe that they properly belong in here.

Q. Now, will you please enlighten us as to what connection, if any, that character of expense which I just named had to do with the operation of the main line of Panhandle Eastern Pipe Line Company?

A. The expenses I have that I am talking about in this study are not necessarily expenses that are associated directly with the pipe line operation.

I have treated this in an over-all general way. I have taken the total expense of doing business, whether it is reading a meter or fixing a leak or whether it is paying the salary of the president of this combined enterprise and I have allocated this total operating expense to use and unused capacity on a percentage basis and since these small expenses you mentioned are in there, they have been treated just as the larger expenses are treated.

Q. Now, would you answer my question, Mr. Morton, please.

. . . . . .

[fol. 3040] The Witness: There is a connection between the expenses of a distributing company and the expenses of the Panhandle Eastern Pipe Line Company which is the main transmission company.

They were affiliated companies. They were engaged in the same general endeavor and that is the sale of gas along the main line of this company.

Now, there is a connection between the expenses of the distributing company which sold main line gas and of the transmission company that carried it there.

Q. A connection between those expenses and what, unused capacity of the pipe line?

A. Yes.

Q. Wherein?

A. Since they were a part of the whole expenses of operating the project as I have explained and since I have split down the whole expense of operating the project into used and unused capacity, they may properly be included.

Q. Well now, suppose Panhandle Eastern Pipe Line Company had owned a very large distributing company [fol. 3041] during this 4½ year period or suppose that Panhandle Eastern Pipe Line Company's subsidiaries owned such a large system.

Let us suppose that that system had incurred, let us say, $3,000,000 of operating expense in the manufacture of gas. Would you have treated that $3,000,000 of expenses incurred in connection with the manufacture of gas as an expense attributable to unused capacity of the natural gas pipe line system?

A. That would have been a question of treatment. If the amount had been large in proportion to the total and if, in my judgment, it did not belong in there, I would certainly have removed it.

Q. You entertain some doubt about whether you would or would not remove it, do you not, Mr. Morton?

A. If it had been large in proportion to the total amount and would greatly affect the answer, I would have removed it.

Q. What would you have done if it was as much as $3,000,000?

A. I would have taken that figure out of this.

Q. Suppose it were $2,000,000?

A. I would have taken that out.

Q. Suppose it were $1,000,000?

A. I would have taken that out.

Q. Suppose it were half a million dollars?

A. I do not know. I do not know how I would handle that.

[fol. 3042] Q. You might leave that much in?

A. I might or I might not, dependent upon how important it seemed. Importance, after all, is a great factor in the preparation of a study like this, its relative importance to the answer.

Q. Well, one-half million dollars a year would make a radical change, would it not, in your figures shown at the foot of Columns A, B, C, D and E on Page 1 of Exhibit 38, would it not?

A. Yes, half a million dollars would have been very important in that answer.

Q. It would give you quite a bit more going concern value, wouldn't it, too, if you had included another half-million dollars in there?

A. Yes, it would have.

* * * * * * *

[fol. 3043] Q. How many of these seven companies that you named were producing companies, I mean, natural gas producing companies, Mr. Morton?

A. I believe two.

Q. Namely, Missouri-Kansas Gas Company and Texas Interstate Pipe Line Company?

A. Yes, sir.

Q. Did Texas Interstate Pipe Line Company own the wells and some production system property in Texas Panhandle Field and in the Hugoton Field?

A. Yes, sir.

Q. And that was the company that was taken over by Panhandle Eastern itself, was it not?

A. That is correct.

Q. And that system now forms a large part of the present production system, does it not?

A. Yes, sir.

Q. Now, Missouri-Kansas Gas Company produced gas in the Local Area, is that correct?

A. Yes, sir.

Q. And that Local Area is presently a part of the en-[fol. 3044] tire Panhandle system, is it not?

A. That is right.

Q. Now, the ad valoremi taxes incurred on the distribution system owned by Central States Gas Utilities Company and Macon Gas & Electric Light Company are included, are they not, in Column G?

A. Yes, they are included.

Q. And you still think they should remain in Column G?

A. I think that is entirely O. K. for them to be in there.

Q. I take it that all of the ad valorem taxes paid by all of the companies which you named with, I think, the exception of Illinois Natural Gas Company, are included in Column G, are they not?

A. Yes, they were all a part of the consolidated companies.

Q. Now, is the same true of interest incurred by all of those companies during the 4½ year period?

A. Yes, sir.

Q. What do you mean by the term "interest" as used in this exhibit? I have particular reference to Line 49 entitled "Interest Charges." What kind of interest does that include?

A. That applies to the bond interest, the actual out-of-pocket interest that was paid out by the consolidated [fol. 3045] companies as a result of the fact that they were in business and had property bonded.

It also included note interest and any other small items of interest that we usually group under the heading of "Other."

Q. Now, those interest charges as shown in Line No. 19 are rather large amounts. Of course, those are the basic amounts used, are they not?

A. Yes, sir, those are the amounts that were used; the basic amounts.

Q. They range from $1,335,289 for the period shown in Column A from April 1, 1932, to December 31, 1932, to $813,694 for the period January 1, 1936, to September 30, 1936.

What is generally the range, is it not?

A. Yes, sir.

Q. Do you consider interest paid on the bonded indebtedness as a proper basis upon which to compute going concern value, Mr. Morton?

A. I am not able to talk to you much about what is a proper basis of going concern value. I have no conviction on that matter that you asked me about then.

Q. Well then, you are not personally making any suggestions along the line of whether it should be included in any rate base for rate-making purposes, are you?

A. No, I am not.

Q. Well, did you make a suggestion to Mr. Biddison [fol. 3046] that this amount should be used for purposes of his study?

A. No.

Q. Well, you said you sold him a few times on a few items. Would you mind giving us some of those items that you sold him on and convinced him that he should include in this study?

A. Well, it was not necessary for me to convince Mr. Biddison. From my conversations I could tell very early in the first discussion we ever had of it that, to his mind, interest charges were certainly a very important part of a calculation that would show costs attributable to unused capacity.

Q. And you agreed with that, didn't you?

A. Yes, I think they are part of the costs that may properly be shown as properly attributable to unused capacity, some of that cost.

Q. For purposes of forming the basis of an estimate of going concern value?

A. Well, I am not too familiar with the subject of going concern value, so when you ask me if it is proper as forming the basis for going concern value, I do not have any opinion on that.

Q. Suppose Panhandle Eastern Pipe Line Company and its subsidiary companies had not had any bonded indebtedness during this 4½ year period of so-called unused capacity. How much would you have included in Line 19?

[fol. 3047] A. None, or nothing.

Q. Well, in your opinion, the greater the bonded indebtedness of a company, the greater the going concern value?

A. I do not know about that.

Q. If one company has a low rate of interest on its bonds, and another company has a high rate of interest on its bonds, would you want to recommend to this Commission that the latter should be given a greater going concern value than the former?

A. I am not testifying on going concern value. I do not know.

Q. But if you made the study for a gentleman such as Mr. Biddison who was making an estimate of going concern value, you would submit a study which would show

considerably more interest "attributable to unused capacity" for the latter character of company than for the former character of company that I have described, is that not correct?

A. I can agree with you if you change your question just to the extent that if I were submitting to him a study purporting to show interest attributable to unused capacity.

Q. Yes, on that account.

A. On that last character of company, the figure would be larger.

Q. Now, you made a study on your own hook, so to speak, before Mr. Biddison came into the picture and took [fol. 3048] over, and I will ask you whether or not your original study included such an item as interest charges as a basis of going concern value.

A. Yes, that is true.

Q. Well, you then do believe that it should go into a rate base, don't you?

* * * * * * * * *

The Witness: I did believe it should go into a rate base. I now have no opinion.

By Mr. Littman:

Q. Now, did your original study comprehend the inclusion of operating expenses as one of the bases for your determination of going concern value?

A. Yes.

Q. So at that time you entertained some ideas of your own on that subject?

A. Exactly.

Q. Well, let's see what those ideas were. Do you have [fol. 3049] any ideas on the subject now?

A. No, I am convinced that I do not know much about going value.

Q. Well, let's go back to the old days when you had some views on the subject.

If one company had high operating expenses by reason of inefficient management and another company had low operating expenses by reason of efficient management, all other things being equal, which one would receive the greater going concern value if operating expenses were to be taken as the test?

A. I do not know.

Q. Well, Mr. Morton, if you were submitting basic data for use in connection with a going concern study such as appears in Exhibit 38, the company having the higher operating expenses by reason of inefficient management would receive a larger amount in Column G, Page 2 of your Exhibit 38, than the company having lower operating expenses by reason of efficient management, is that correct?

A. That is correct, if we followed the formula that we have shown here in these five methods.

Q. Do you consider that a proper method that produces such a result?

A. A proper method for arriving at costs attributable to unused capacity following the formula that I have used here, I would say yes.

[fol. 3050] Q. Now, your study, particularly that part of it which is shown on Page 1, Line 21, "Operating Expenses—Partial" includes every dollar of delay rentals paid on unoperated acreage by Panhandle Eastern Pipe Line Company and its subsidiary companies during the entire period.

From April 1, 1932, to September 30, 1936, does it not?

A. It does.

Q. Will you please look at your working papers and tell me how much has been included in Line 21 of delay rentals paid on unoperated acreage?

A. For what period, did you say?

Q. For your 4½ year period which I believe you have characterized from time to time as the "Not loaded period."

A. I do not have the sum added.

Q. Well, you have got $66,319 in the nine months of 1932, have you not? A. Correct.

Q. $85,691 in the calendar year 1933? A. Correct.

Q. $85,824 in the year 1934; $85,265 in the year 1935, and $63,445 in the nine-month period in 1936 from January 1 to September 30 in that year?

A. Correct.

. . . . . .

[fol. 3051] Q. According to my arithmetic, it is $386,544. Does that sound right to you?

A. That appears to be correct.

Q. If it is incorrect, I wish you would please correct it later. A. Yes.

Q. Now, do you know whether the company proposes to capitalize delayed rentals paid subsequent to September 30, 1936?

A. No, I do not.

Q. You have a pretty good idea, though, that they do not intend to, don't you? A. Yes.

Q. By "yes", you mean that my statement is correct?

A. Correct.

Q. Perhaps it would be well for you to tell us what delayed rentals are? I am not sure whether the record has a descriptive statement of that or not. I would appreciate it if you would make a brief statement descriptive of the meaning of that term.

A. I previously stated that I was not an accountant but perhaps my rough knowledge of it will suffice.

Q. All we want is a general description.

A. Those are payments that are made to land owners by the company in lieu of drilling of wells.

Q. And that acreage is commonly called unoperated or [fol. 3052] undrilled acreage, isn't it?

A. I believe so.

Q. Well, does unoperated acreage represent used capacity or unused capacity, Mr. Morton?

A. I think it depends upon the circumstances.

Q. Suppose you give us the circumstances in which you would consider unoperated, undrilled acreage to be used capacity?

A. Let me discuss the unused capacity for a moment to get my thoughts clear on it.

If you made contracts or purchased something in excess of that which was immediately required because you were going to need it after a while, in the interim between the time you purchased it and the time you did use it, it would be unused and, therefore, in this study here would have been treated as unused capacity.

Now, I have only treated a portion of these delayed rentals as unused.

Q. I do not know whether you had completed your answer? A. Yes.

. . . . . .

Q. Well, none of it is used, is it, until it is drilled? [fol. 3053] A. Well, I do not think you necessarily have to have something immediately active to say that it is in use. I submit that an inanimate object could be used.

Q. Under your theory, delayed rentals might just as well be capitalized in 1940 as in 1935, might they not?

A. I do not believe I understand your question.

Q. What don't you understand about it?

A. You say these delayed rentals might as well be capitalized in 1940 as 1935.

Q. Under your theory, it would be just as proper, according to your theory, to capitalize them in 1940 as to capitalize them in 1935?

A. Perhaps I do not have enough knowledge of accounting to get at what you are speaking about, Mr. Littman.

Q. Let me put it this way: The use that is being made of this exhibit is, that these amounts that you have in Column G or amounts very similar to them, it is claimed, should be capitalized, that is, they should be made a part of the rate base upon which the company claims that it is entitled to earn a reasonable return."

Mr. Wheat: Of course, you understand, Mr. Littman, there has been no suggestion that it has been capitalized in the technical sense of that term.

Mr. Littman: In the practical sense—

Mr. Wheat: (Interposing) No, nor in the practical [fol. 3054] sense of the term. That is what I think is bothering the witness, that it was capitalized.

Mr. Lee: But it is in the rate base—

Mr. Wheat: (Interposing) I think what is included in the rate base and what is capitalized is a highly different problem. I think the question is confused.

The Witness: But that question goes way beyond this study that I have made here, which is just my idea of the costs attributable to unused capacity.

Mr. Lee: But the object and end of the study, though, regardless of how you characterize it, is to get the money there represented into the rate base upon which you want a return, isn't that true?

The Witness: If you want to make an assumption, Mr. Lee.

Mr. Lee: Isn't that why you made the study?

The Witness: That is perfectly all right. But, as I say, that is so far ahead of the thing we are talking about here that your witness cannot give you any enlightenment on that subject at all.

Mr. Culton: I suggest counsel address the questions on propriety to the witness who testified on propriety. This witness has stated he had done nothing except to determine what it cost the company to carry unused capacity.

He has not testified as to what should go into the rate base or anything. Mr. Biddison has testified on those matters.

[fol. 3055] Mr. Lee: Yes, but he and Mr. Biddison worked so closely together and it is a part of the general mosaic of the picture they are painting here and it is common-sense he knows what the objective is and no matter what you call it, the objective is to get it into an enlarged rate base and get a return on it.

He knows what we are talking about. He is not confused or misled, or anything.

By Mr. Littman:

Q. Let me get at the matter this way, Mr. Morton.

You understand, I am not trying to confuse you deliberately.

Is it not true, under your theory, that delay rentals might just as well be called "expense attributable to unused capacity" in 1941 as in 1935, is that not correct?

A. Why, I think that is true.

Q. Now, isn't it a fact that, under your theory, the greater the delay rentals paid, the greater the amount that you find attributable to unused capacity and the greater the going concern value, if your study is to be used for going concern value?

A. Well, is it necessary for me to assume that it is going to be used for going concern? Couldn't I just answer your question by saying that the greater the delay rental, the greater under this study here, showing costs attributable to unused capacity, the greater would be the [fol. 3056] costs attributable to unused capacity.

Q. That is satisfactory. That is your testimony?

A. Yes, sir.

* * * * * * * *

[fol. 3059] O. W. MORTON, a witness, having been previously duly sworn, resumed the stand and testified further as follows:

Cross-Examination (Continued).

By Mr. Littman:

Q. Mr. Morton, at the close of yesterday's session, we were discussing Exhibit 38. I wish you would please turn to Page 1.

Now, in Lines 1 and 2, you show the total investment. Will you briefly describe what is included in those figures, just generally, without giving us the details.

A. I might refer here to my memorandum, which incidentally, is included with my working papers which you have seen.

Q. Yes.

A. My memorandum to the Accounting Department requesting this information.

"We will require average investment in property, plant and equipment for each of the periods broken down into—

(1) Main line;

(2) Local Area;

(3) Argus;

(4) Hugoton 16-inch line;

[fol. 3060] (5) Liberal Compressor Station.

"The purpose of this segregation is to obtain figures that will enable me to make certain allocations."

That is the request and the information shown in Lines 1 and 2 is information sent to me by the Accounting Department in reply to that request.

Q. So that the total in Line 2 includes all of the property that you have just described? A. Yes, it does.

Q. Then you make certain deductions, do you not, from that total, as shown in Lines 3 and 4? These deductions are for "Argus, Local Area and portion used in transportation".

Would you please give us the breakdown of those figures as between the three classes which are named in Lines 3 and 4?

A. Yes. That information is shown on the third work sheet, my work sheet No. 3. On that work sheet we show the total investment in the Local Area forwarded to me by the Accounting Department and, incidentally, that Local Area investment which we have taken out of the total includes one of the subsidiaries to which we were referring yesterday, the Missouri-Kansas Gas Company.

I have since found that that subsidiary is listed here in Local Area and, therefore, was deducted from this entire presentation we have made in Exhibit 38.

Q. When you speak of deductions, are you speaking of [fol. 3061] deductions of investment and gross revenues?

A. Yes.

Q. Are you including deductions for—

A. (Interposing) Yes, the operating expenses also are taken out of this picture so that that item that we discussed yesterday is not in here at all.

Q. That is, as to the—

A. (Interposing) Missouri-Kansas Gas Company.

Q. Missouri-Kansas Gas Company? A. Yes.

Q. How about interest? A. That is out.

Q. That is out also? A. Yes, sir.

Q. Will you proceed with your explanation?

A. You were asking me to give you a breakdown of the items which are totaled on Line 4, Page 1. Those totals consist of three items; the investment which was furnished me [be] the Accounting Department representing the total investment in the Local Area which is not related to the

main line system and, therefore, I felt should be eliminated from this study; it also includes Argus investment, that is, the investment in some wells out in western Kansas with which you are perfectly familiar that that has nothing to do with this main line story; and also includes an al- [fol. 3062] located portion of the main line which was used for transportation of gas for Northern Natural Gas Company.

That is the detail of the three items, the total of which is shown on Page 1, Line 4.

Q. Now, will you explain why you deducted the investment used for transportation on behalf of Northern Natural?

A. That was a service for which the pipe line was not designed. My conception of its probably was this: Here was a pipeline of some 860 miles in length. It had been constructed for the purpose of furnishing a market at some future date but, in the interim, there were certain parts of it that were not loaded, namely, out of the 860, about 800 miles of it was not loaded. For a short time, we were able to carry some emergency gas for the Northern Natural Gas Company at a very small rate and, during the time that we carried this gas for the Northern Natural Gas Company, that section of the line carried a pretty fair load and I felt that, in a story that is to show the cost of carrying unused facilities, it had no place, so I eliminated it.

Q. Did you eliminate any part of the production system investment that was being used to serve Northern Natural?

A. No, I did not.

Mr. Culton: Was any portion of the production system used to serve Northern Natural?

The Witness: I believe this Northern Natural gas was [fol. 3063] produced from another source other than ours.

Mr. Culton: I thought counsel might have an erroneous understanding of the facts there.

Trial Examiner: What is the fact as to that, Mr. Culton?

Mr. Culton: We picked it up from their wells and transported it.

Trial Examiner: It was merely a transportation service?

Mr. Culton: That is right.

Trial Examiner: You were not selling gas?

Mr. Culton: We were not selling gas from that particular service. We were selling Argus but that gas was not used in these facilities at all.

Mr. Littman: Mr. Culton, you are quite familiar with that situation?

Mr. Culton: I think so.

Mr. Littman: Would you mind telling us where this gas was picked up and from whom it was secured and where it was delivered? Perhaps you can tell that.

Mr. Culton: I have a general idea, but I think the witness can be more specific about it.

The Witness: Roughly, the story is this: They had their own production out there around Hugoton, Kansas.

By Mr. Littman:

Q. By "they", you mean Northern Natural?

A. Northern Natural, or else had made arrangements [fol. 3064] for some production out there and, pending the time of their building a pipe line over to it, they made an arrangement with us, under the terms of which they would use our pipe line since it was unloaded and had a lot of unused capacity in those days, they would use our pipe line until such time as we told them to get off and we picked up this gas out there and carried it up to Liberal, and from Liberal station east about 80 miles, to the point of their main line intersection with ours and there we turned it back to them.

Q. So that you made an elimination from investment of the investment applicable to that classification for the purposes of this study?

A. Yes, I did.

Q. And you made an elimination from the gross revenues?

A. Yes, I did.

Q. For that?

A. Yes, and also the operating expenses in connection with that service.

Q. Yes. How did you make the elimination from operating expenses? What method was used?

A. I used a very simple, direct standard usual engineering procedure. Very simply explained, it is just this: That if the investment necessary to do a certain thing was so much of the total, then the operating expenses that might be eliminated from the total was just in proportion [fol. 3065] to the investment that was there.

Q. And that proportion of deduction was the proportion of all of the expenses?

A. Yes, sir.

Q. You applied a ratio to the total?

A. That is right, a ratio to the total project.

Q. And did you apply the same method with respect to making a deduction for interest?

A. Yes; I did. No interest is in there for that.

Q. And what you have said with respect to Northern Natural, I presume, would go also for the Argus and Local Area?

A. That is true, the same general approach.

Q. Now, Mr. Morton, I refer you now to line 21 "Operating Expense, Partial." Now, will you explain what expenses are included in that line?

I believe yesterday we agreed that all delay rentals were included?

A. Yes, in general, I did this: You asked what is included in that line. I realized from my studies that there was, let us say, an average of 55 percent unused capacity in this line.

I reasoned then, by a very simple process, that if there was 55 percent unused capacity in the line, that probably 55 percent of the operating expenses of this whole project were being incurred because of this unused capacity.

[fol. 3066] Q. You mean 55 percent of all the operating expenses less that proportion of them which you have explained you have deducted?

A. You are anticipating me, I am building up to that. As I say, I felt that if there was 55 percent unused capacity in the line, then it would be a reasonable assumption to just

sit right down and take 55 percent of all the operating expenses and say that they were incurred because of unused capacity but, after I studied the problem a little bit, I could see that there were some expenses in this project that I could not say were there because of unused capacity.

I could see that there were some very large items, like purchased gas, for example, the cost of purchasing gas. Well, that has nothing to do with unused capacity so I just eliminated it from this whole study.

I am discussing a little bit in detail these operating expenses that you have asked about.

There is the next item on that list and I am looking at the list which I requested the Accounting Department to furnish me, and the next item of expense, the next general classification is "Purchased Gas Expense."

Well, that expense is expense that results from employing men to read meters out there in the field and to pay for their transportation, maintained their cars and supplies and equipment.

Well, in those days, we had more or less of a skeleton [fol. 3067] force out there. This skeleton force was maintained, whether we sold 10 billion a year or 20 billion a year, just about the same size. It had no relation to the fluctuations of the amount of gas sold.

It appeared to me to be largely an item that was related to unused capacity but, to be on the safe side and to avoid long, detailed discussions on it, I eliminated it from this study. I eliminated all of that expense.

Now, the next item is the one that we were discussing, "Delay Rentals." As I say, I analyzed these expense account, in general. I did not go into them in detail to find out all of the charges that have been made of the four or five year period against every account.

I just treated them in general and said, "What is this delay rental? Well, that is an expense that is incurred on account of maintaining acreage." That is what delay rental really is. It is one of the expenses incurred with maintaining acreage.

Now, that acreage was maintained not for the present time but for the future time when the line would become loaded, so it seemed to me, and I think it is quite apparent to you, that the acreage was lying there awaiting the time when it could be used in the fully loaded activities of this pipe line so the operating expense, it seemed to me like the most natural thing in the world to assume that the operating expense that was incurred in maintaining that unused [fol. 3068] acreage, if you please, unused because it was there awaiting the time when it would be used for a fully loaded line, it seemed to me that that expense certainly should be given careful consideration in arriving at those expenses that were attributable to unused capacity during the early years of this project.

You want me to go right on through the group?

Q. Yes.

A. The next item we have here is "Gas Wells"—

Mr. Chamberlain: (Interposing) May I ask there, I beg your pardon, then you did not eliminate the cost of the delay rentals in your computation?

The Witness: The net effect is that some of the cost of the delay rentals shows up in this study, Exhibit 38, as expense incurred on account of unused capacity, so the answer is, I did not eliminate it.

Mr. Chamberlain: Well, is it all included? That is, the 55 percent proportion of it?

The Witness: No, I am glad you asked me that, Mr. Chamberlain, I had overlooked that point. We are looking now at total expenses. I am looking at delay rentals for the year 1933, to be specific, which was $85,691.

Now, 10 percent of that $85,600 was eliminated when we went through our operating expense and took out everything connected with Local Area, Argus and Northern Natural.

[fol. 3069] That is to say, 10 percent of that dropped out of the picture before we started and then, of the balance, which would be some $78,000, of the balance only a portion have I charged into the cost or against the cost of carrying unused capacity and that proportion is based upon the

percentages shown in the five different methods, about 60 percent.

By Mr. Littman:

Q. Now, this 10 percent that you spoke of, how did you arrive at that?

A. You asked about the items on Line 4, that is, Northern Natural investment, Local Area investment and the investment in Argus.

Now, I took that investment which is about 10 percent of the total, by the way, and applied that percentage to the total operating expenses, I took out right at the start 10 percent of the operating expenses and threw them clean out of this whole story because they had nothing to do with it.

Q. Will you proceed with your explantion?

A. Gas Well Royalties were a very small item during those years. Of course, gas well royalties has nothing to do with unused capacity in the system and so, naturally, I threw it out.

Now, the next item I have listed as expenses which were considered in arriving at the cost of carrying unused capacity, the next item is "Production Department, Other." [fol. 3070) Production Department, other, means, expenses incurred in operating our production department, which have nothing to do with the delay rentals or gas purchased expense or the cost of gas or rather, when I say, "nothing to do with it," I mean after we eliminate from all production expense the cost of gas purchased and purchased gas expense and delay rentals and royalties, then we have a residue which is left which, by the way, averages about $40,000 a year, and that represents the cost of maintaining a production organization.

A large part of that goes to the office in Kansas City. Now, my conception of this thing was that this whole production expense, almost all of it that is, the portion that is classified here as "production, other," was attributable to unused capacity because we were maintaining a big standby force there to operate this big project although we were not selling very much gas out of it but because it carried the title, "Production", I omitted it.

I just leaned over backwards and threw it out of this study because I was afraid that when the time came and we got to discussing it, we would spend too much time and detail on it and it does not amount to much anyway, $40,000 a year, so I just threw it out but I do not believe it should be out and it does offset many of the small items we have discussed to this point.

Now, the next item was "Transmission". I asked the Accounting Department to give me a breakdown of all the [fol. 3071] transmission expense just under two heads. I did not ask for details at all.

As I say, we tried to avoid detailed studies in these expense accounts because that is an interminable proposition. There are many millions of items that have been charged, literally millions of items that have been charged to these accounts over these periods.

I asked the Accounting Department to give me the transmission expense in two headings; (1) compressor stations, and, (2) other transmission expense.

I asked for it under these two headings because I knew that part of the compressor station expense should go out of this picture. I knew that some of the compressor station expense was proportional to the amount of gas carried and had nothing to do with unused capacity, so I wanted compressor station expenses separate so I could eliminate it.

Now, in eliminating compressor station expense, I have eliminated a great deal of the value or the cost that should go in this study.

As I say, I have eliminated it completely. You wonder why I say that. It is because of this: During all those years, we maintained a standby force, we maintained standby equipment, supplies and materials of all kinds at these compressor stations awaiting the day when they would be fully used.

Now, a lot of that expense, as I say, was attributable to [fol. 3072] unused capacity. I think that will be clear on the face of it without my going any further in detail, but I eliminated every bit of it from this study because I felt we were going to need some leeway in some of these items.

I knew that there would be some definite items included here inadvertently or in my haste to get a quick picture drawn. I knew there would be some items included if you debated them out, item by item, which would not belong in there, so I left that leeway in these other accounts to take care of such items.

Now, next, we come to "Transmission Expense"—

Mr. Wheat: (Interposing) Pardon me. Mr. Morton, you did not give a sample amount of this compressor station expense.

The Witness: The total compressor station expense averaged for the period about $100,000.

By Mr. Littman:

Q. Averaged for what period?

A. For the entire period of this study.

Q. You mean 4½ year period?

A. Yes, it is about $100,000 per year, is what I intended to convey. To be specific—

Q. (Interposing) Just a minute. You have confused me.

Now, we are speaking of a 4½ year period from April 1, 1932, to September 30, 1936. Now, is the $100,000 for the entire period or is it $100,000 per year over the 4½ year period?

[fol. 3073] A. $100,000 per year over the 4½ years.

Mr. Chamberlain: Now, that is compressor station expense?

The Witness: Yes, sir.

Mr. Wheat: And you eliminated all of it?

The Witness: I eliminated all of it.

* * * * * * * * *

The Witness: The next item that I have is a very sizeable item. It is "Transmission, Other". It averaged close to $200,000 a year for the entire period. I considered all of this expense in arriving at the amount of operating expenses chargeable to unused capacity during these years, and when I say "considered all of it," I do not mean that

I included all of it as operating cost of carrying unused capacity.

I mean that I considered it and I applied to it the percentages and the method shown in Exhibit 38.

By Mr. Littman:

Q. You mean, you included all of it in Line 21, don't you?

A. I mean I included all of it in Line 21, but after Line 21, I eliminated some of it, about 10 percent of it, on account of Local Area, Argus and Northern Natural, and then I eliminated about 45 percent of the balance on the ground that it certainly was not due to unused capacity.

That left about 55 percent of all of that shown under [fol. 3074] "Transmission, Other." It left about 55 percent of it in the answer.

Now, the next item that I have listed is "Distribution." That item averages about $18,000 a year, I think. You asked yesterday why we should include an item that was labeled "Distribution" in a study like this.

Mr. Culton: That amounts to how much per year?

The Witness: That amount to about $18,000 per year, and you said at the time you asked me whether or not meter reading of the distribution customers' meters should be included in here.

First, I want to state that I did not include all of distribution expense in the final answer which final answer is my figure of the cost of carrying unused capacity in this system.

By Mr. Littman:

Q. Just a minute, you did not include all of anything in your final figure, did you?

A. That is right.

Q. Now first, let's talk about Line 21.

. . . . . .

[fol. 3075] The Witness: Line 21 is merely an intermediate step in this process of arriving at the operating expense attributable to unused capacity.

. . . . . .

[fol. 3076] Q. I am going to put to you a very simple question.

State whether or not you have included in Line 21 all of the distribution operating expenses which you just described a moment ago.

. . . . . .

[fol. 3077] I would like the record to show that.

The Witness: All of that expense entitled "Distribution" is carried over to Line 21.

Q. Now, did you make any deduction from that amount of distributing expense included in Line 21 before you got down to Line 26?

Let's put it that way. Have you made any deduction in Line 26 or before you reached Line 26 from that distribution system? A. Yes.

Q. All right. Now, you may state what you deducted.

A. The total deduction from the totals shown on Line 21 is shown on Line 24 and is—I would like to strike that—the deduction in operating expenses that we are discussing and the expenses which are shown in Line 21 amount to about 10 percent for Local Area gas transported, Argus pipe line elimination and from the balance, I have eliminated about 45 percent on an average as being the amount that was attributable to used capacity, leaving in unused capacity about 55 percent of the balance.

Q. And you are way ahead of me again. I would like to go through this step by step in order that the record may show clearly what you did. We are going to get to [fol. 3078] that 45 percent and we will give you every opportunity to explain it, but tell me, Mr. Morton, whether you made any deduction in Line 24 from the total distribution system which was included in Line 21. I am speaking now of distribution expense. A. Yes.

Q. Now, what deductions did you make?

A. Line 24 shows the total of all deductions from operating expenses shown in Line 21 which were made as a result of using the Argus, Local Area and Northern Natural Gas allocation.

Q. Can you tell us what that allocation was?

A. Since that property was about 10 percent of the total property, why, the effect of washing that through the operating expense means that we have reduced the operating expense by about 10 percent.

Q. I see. In other words, if I correctly understand you, and we are now speaking of distribution system expenses; you put all of them in Line 21 and then you made an elimination in Line 24 of approximately 10 percent to get the 90 percent balance approximately in Line 26, is that correct? A. That is correct.

Q. After you had your amount in Line 26, you then applied your percentage of unused capacity for each of the periods? A. That is correct.

[fol. 3079] Q. Is that right? A. That is correct.

Q. That brings us down to the 45 percent which you were speaking about, roughly.

A. Yes, it does. The next item——

Q. (Interposing) Just a minute. Why did you allocate distribution expense on the same basis as you allocated the Argus, Local Area and transportation expense?

A. I just took the total and allocated the total and since the distribution formed a part of the total, it went right along with the total.

In other words, I made no separate study, as I said before, no separate detailed study of each account.

Q. Well, did these distribution systems have anything to do with the transportation of gas for Northern Natural?

A. I have thought about this distribution system in connection with this whole matter since we discussed it yesterday, and it is quite apparent to me that this distribution business is just as much a part of the unused capacity of this system as any of the other items that we have discussed.

Q. Even though one of these distribution systems was carrying artificial gas?

A. Even though one of them happened to be caught in the net with the Central Distributing Company which was selling gas on the main line.

Q. Now, will you answer my question, please, Mr. Morton?

[fol. 3080] A. Your question was, as I recall it, whether or not the distribution system has any connection with the Northern Natural Gas?

Q. Yes. A. Was that it?

Q. Yes.

A. I see no connection between the two.

Q. Well, what connection did these distribution systems have with the Argus sales?

A. This had no connection with the Argus sales.

Q. What connection do these distribution systems have with the Local Area situation?

A. Of course, in that case, you do realize that much of the distribution is in the Local Area around Kansas City. A large part of our distribution activities were in the Local Area.

I might say that if I had made a detailed study of that distribution account, I would have eliminated more than was eliminated by using the 10 percent that we spoke of.

Q. I do not know whether you had completed your discussion of these expenses or not, Mr. Morton? I want to give you every opportunity to do so.

A. No, sir, I can go right along through them. The next item that we have here—

Q. (Interposing) We are still talking about Line 21; [fol. 3081] are we not? That is, the total figures included in Line 21 and then you are tracing the deductions?

A. That is correct.

Q. We have discussed so many other things since then that I wanted to make sure that we were talking about the same thing now.

You may proceed.

A. The next item we have in this detail of operating expenses consisted, the total of which appears in Line 21, is customers' accounting and collecting.

This item amounts to about an average of eighteen or nineteen thousand dollars a year. I included that along with the other expenses considered.

Mr. Wheat: Which is that item, Mr. Morton?

The Witness: This item now is customers' accounting and collecting.

Mr. Wheat: Thank you.

The Witness: The theory under which that was included, if we have to have a detailed theory for the inclusion of each one, is that a great deal of the accounting that we had, the accounting force which we had in the company was maintained because we were a growing company and we were preparing to handle larger affairs than we were at that time handling.

Therefore, I thought that certainly a portion of the customers' accounting and collecting was attributable to unused capacity. [fol. 3082]

By Mr. Littman:

Q. Just before you leave that point, had you finished your answer on that character of expense that you have called "Customers' Accounting and Collecting Expense"?

A. Yes, sir.

Q. You would expect, would you not, Mr. Morton, that the customer accounting and collecting expense would go up when Panhandle Eastern attached more customers, wouldn't you?

A. Yes, but not proportionately, and that is the point I am making.

Q. You mean, not exactly proportionately?

A. That is right, not exactly proportionately, or even approximately proportionately. You see, part of that force, as I say, is a standby force, occupying a large office, awaiting the time when they, like the pipe line, would be used.

Q. Now, that customers' accounting and collecting expense includes, does it not, accounting and collection expense in connection with the distribution systems?

A. A great deal of that is attributable to the maintenance of the distribution system.

Q. In other words, this is all in addition to the $18,000 you mentioned a moment ago, is it not? We are now talking about a separate character of expense.

A. Yes, the two together just about form the annual expense of the whole Central Distributing Company. [fol. 3083]

Q. Now, a company such as Panhandle Eastern Pipe Line Company, which is a wholesale company, does not,

when it confines itself strictly to wholesale business, have very many customers in number, does it?

A. When it confines itself strictly to wholesale business, I think that is true.

Q. And that is the purpose for which this system was originally designed, isn't it?

A. I think so.

Q. Now, in the years when Panhandle Eastern owned these distribution systems and had these various retail consumers to serve directly through its subsidiaries, it, of course, had a higher amount of customer accounting and collecting expense than it would have had, had it confined itself strictly to wholesale business, is that correct?

A. Yes, it costs more to carry on that kind of business than a wholesale business.

Q. But you still feel that you were justified in including a part of that expense?

A. Yes, because we have included the revenues too, you see, from that business, and the M. c. f. also in our study. We did not just weight it down with the operating expense. We have got everything of this company in there, all of the Central Distributing Company activities.

[fol. 3084] I might say to you, if we threw the whole thing out it would not affect the answer one percent.

* * * * * * * * *

Q. You are talking about one item?

A. I am talking about the Central Distributing system. If you threw all the items out you would not affect the total one percent.

Q. But in addition to the amount you are talking about—

A. (Interposing) The total of all of the subsidiaries we talked about yesterday is less than one percent.

Q. Well, are you prepared to give us a detailed itemization of all of this character and type of expense?

A. I am prepared to tell you that it would not affect the answer over one percent.

* * * * * * * * *

Q. Suppose you answer my question.

[fol. 3085] A. I have made a study that is detailed enough to assure me that what I have said is true.

Q. Detailed enough to convince you, but we do not know about it, Mr. Morton. Is it in your working papers?

A. I have prepared, since you and I talked, a study, Mr. Littman, showing that if we threw out every subsidiary that we have discussed, we would not affect the answer $100,000 out of five and one-half million dollars.

Q. Have you made a detailed audit of the company's books to ascertain the amount of expense involved in distribution and the interest charges?

A. There is no use in my saying I have made a detailed audit. I have made over-all figures and made enough allowances for every kind of error that might creep in, and still do not get any appreciable error in the answer.

Q. Suppose you tell us how much interest Central States Gas Utilities Company paid during these 4½ years?

A. I do not know the interest Central Distributing paid, but in this study, I have not considered the interest Central Distributing paid. This is a consolidated story. The inter-company payments of interest do not show up here, in this item.

Q. They are certainly included, are they not, in the totals at the bottom of Page 1?

A. We do not add every interest that every subsidiary [fol. 3086] pays to the parent company and duplicate it each time as it goes from one subsidiary to the other. This is a consolidated statement of interest.

Q. I understand that, of course, it is a consolidated statement. Did Central States Gas Utilities Company have any outstanding bonds?

A. No, I do not think it did, as I recall it.

Q. Do you know whether they did?

A. I am quite sure they did not.

Q. Do you know whether any of the other companies, subsidiary companies, that we discussed yesterday, whose bond interest is included in here, had any outstanding bonds?

A. I do not see how that would affect this story at all.

Q. If they had any outstanding bonds and paid any interest, that interest would be included, certainly, would it not, in Line 19?

A. Yes, sir, if they paid interest to the parent company, which they did, why, it would be washed out in this story, since we are considering a consolidated story.

Q. Well, if they paid it to others than the parent company?

A. If they paid it to others than the company, that is true, it would.

Q. It would be included? A. Yes.

* * * * * * * *

[fol. 3087] Well, do your working papers show the amount of interest paid by these subsidiary companies to outsiders?

A. If any was paid to outsiders by these subsidiary companies, it shows on my working papers, entitled "In-
[fol. 3088] terest Expense."

Q. Does it show a breakdown of the interest?

A. This is a consolidated story and does not show the breakdown of interest payments between the inter-company relations.

Q. And the figure that you used as interest payments was furnished to you by someone else, wasn't it?

A. This figure was furnished to me by the Accounting Department.

Q. And you are not personally familiar with those figures, are you?

A. I am to the extent that I discussed them with the Chief Accounting officer and he explained—

Q. (Interposing) Just a minute. I object to what the chief accounting officer explained. I asked you whether or not you, of your own personal knowledge, knew the breakdown of the figures that you used for the purposes of this study with respect to interest?

A. I, of my own personal knowledge, have not gone into the books of the company to obtain details that back up these over-all consolidated figures that have been handed me by the accounting department, that is correct.

Q. So that it follows, does it not, that you do not, of your own personal knowledge, know how much bond interest is included in your figures that was paid by these subsidiaries to outsiders?

[fol. 3089] A. Not as individual companies, but as a total, yes.

Q. Of course, your total is shown on Page 1 of Exhibit 38, is it not, and what you have just said with respect to interest is true, also, is it not, of the ad valorem taxes shown in your study?

That is to say, you have no personal knowledge of the details of those taxes, do you?

A. That is correct. The Commission has seen all of my working papers, every one that applies to this, and it is shown on the face of them just what it is.

Q. And those working papers do not show any breakdown, do they?

A. They do not show a breakdown. They show totals consolidated.

Q. And the same is true, is it not, of the operating expenses? You do not know, of your personal knowledge, the details of those operating expenses, do you?

A. All of these figures are on a consolidated basis. I do not know the individual amounts contributed to the total by each of the separate subsidiaries.

Q. It follows then; does it not, Mr. Morton, that you do not, of your own personal knowledge, know what proportion of the expenses, taxes, and interest attributable to these distributing systems that we have named are in-

[fol. 3090] cluded in your total figures and study in Exhibit 38?

A. Study 38 and the figures shown in that study do not reflect the individual company's interest payments.

Q. Are you talking about interest payments by those companies to Panhandle Eastern, their parent company, or to others?

A. It shows no detail as to either of those.

Trial Examiner: At the beginning of your testimony this morning, Mr. Morton, as the Trial Examiner recalls it, you read the substance of a request which you had made of the Accounting Department.

Is it correct to say that your request was for a consolidated statement of the items to which you made reference?

The Witness: It is.

Trial Examiner: And when you say a consolidated statement you mean that we shall understand that the

statement was to include all of the subsidiaries which were named yesterday?

The Witness: Yes, sir.

Trial Examiner: And your entire Exhibit 38 is based on the data and information you obtained from the Accounting Department in response to that request?

The Witness: Yes, sir.

Mr. Coulton: May I ask if that Accounting Department is the department of which Mr. Watkins is the head?

The Witness: It is. I understood all of the figures in [fol. 3091] this rate case were to be submitted on a consolidated basis.

Mr. Wheat: At any rate, that is what you have attempted to do?

The Witness: Yes, sir.

Trial Examiner: And, of course, you can obtain full detailed information as to any of these matters concerning which Mr. Littman has interrogated you, if given time?

The Witness: Yes, sir.

By Mr. Littman:

Q. Now, have you completed your enumeration of the expenses and the manner in which deductions were made? I believe the last one you mentioned was "Sales Promotion Expense." Are there any others?

A. "Administrative and General" is the next large one. By the way, I do not wish to skip any of them. "Sales Promotion Expense", I do not believe I have discussed that.

Q. I think you did—I am sorry—yes, that is right, "Sales Promotion Expense" you did not yet touch upon.

A. That is, as you know, expense that is incurred on account of efforts to build load. I felt that we were maintaining a sales organization that was consistent with the efforts of a sales organization operating with a fully-loaded line, and that these expenses were attributable to unused capacity in much the same manner as were the other items that I have mentioned above.

[fol. 3092] The next item—

Q. (Interposing) Just a minute before you go to the next item.

In Line 21, you have included every dollar of sales promotion expenses incurred by Panhandle Eastern and its subsidiary companies, all of which you named yesterday?

A. That is correct.

Q. Including the distribution system sales promotion expenses?

A. That is correct.

Q. Now, have you completed that character of expense? Suppose you give us the next.

A. The next item is a large one, and amounts to about $200,000 a year.

Mr. Wheat: By the way, you did not state the average of the sales promotion expense.

The Witness: That average is about $35,000 a year, thirty-five to forty thousand dollars.

The next item is "Administrative and General", averaging around $200,000 a year. I felt that the administrative and general expense that was incurred during these, shall we say, lean days, was largely incurred on account of, and was attributable to unused capacity, so I considered all of that expense in this study although I believe I explained before the total of none of the items is carried over into the final answer.

[fol. 3093] By Mr. Littman:

Q. Of course, your exhibit clearly shows that you work from Line 19 with respect to expenses, make certain deductions and then secure your percentage of so-called unused capacity and work over, after applying the percentages of unused capacity by five methods, until you get over to Column G.

That is clear in your exhibit, isn't it?

A. Yes.

Q. Well, do these administrative and general expenses include all of such character of expenses incurred by, not only Panhandle Eastern Pipe Line Company, but its

wholly-owned subsidiaries, namely, Central Distributing Company, Central Pipe Line Company, Central States Gas Utilities, Macon Gas & Electric, Missouri-Kansas Gas Company, Panhandle Illinois Pipe Line Company and Texas Interstate Pipe Line Company?

A. That is correct.

Q. Does that character of expense which you described as administrative and general expenses include the salaries of executives?

A. It does.

Q. Of all of these companies?

A. It does.

Q. What other type and character of salaries are included in that?

A. That is a catch-all title, administrative and general. [fol. 3094] We show there all of the expenses in connection with salaries and expense of doing business principally in the main office other than those which we have previously described in detail.

Q. Does that complete the list of expenses, Mr. Morton?

A. It does.

Well, there is a small item which bears the title "Non-operating Expense". Now, I was working pretty fast trying to get an answer to this thing, using over-all methods, rounding off percentages, and, generally, short-cutting it to the point where I thought the answer was correct, however, and just to avoid any argument on the subject, I just threw out all non-operating expenses.

I felt some of them were attributable to unused capacity but it is just another one of those items where I tried to lean over backwards to be on the safe side, and I threw the thing out for consideration entirely.

Q. Will you name one item you considered attributable to unused capacity in the non-operating expenses?

A. Non-operating?

Q. Yes.

A. I never even reviewed the items that are charged in the non-operating expense. I think if I talked about it a while and looked into it a little bit, I could tell you what is in it, but I thought since we are just going to throw it out

of this study anyway, lock, stock and barrel, in order to be [fol. 3095] on the safe side, we might just as well not spend any time hunting it up to see what it was.

Q. If you never looked at it and do not know what is included in that category of expenses and you are unable to name any at this time that have any connection with unused capacity of the pipe line system, how can you say that you were leaning backwards when you threw them all out?

A. I figured that is a fair statement to say that you are leaning backwards and on the safe side when you throw something out completely from your study without even examining it, since it would take so much time to do so and it seemed to me like that is leaning over backwards.

I feel sure, if we would analyze an account that has charges of ten to fifteen thousand a year in it, some of them could be said to be attributable to unused capacity, but it is just typical of the methods I used, Mr. Littman.

Q. You are sure if you looked long enough and hard enough you would find them in there?

A. Yes, I feel sure that some of the non-operating expense of this company during those years was attributable to unused capacity and had a direct relation to the fact that we had here a big project that was getting ready to go to town but had never gone yet.

Q. Suppose in browsing through those expenses which you have characterized in that last group, you had found [fol. 3096] some expense incurred in connection with manufacturing gas. Would you have included those in your study?

A. I would not have picked out any portion of a general heading like this and tried to split it down. I was not working to that fine a limit. No, I would still have left it out.

For all I know, there might be some expenses with that Macon Company right there automatically eliminated.

Q. Now, Mr. Morton, what daily line capacity did you use as 100 percent capacity?

A. I used as the basic figure, a capacity of 125 million cubic feet.

Q. And that is shown, is it not, in Line 18, Column F, on Page 1 of Exhibit 38?

A. Yes.

Q. What annual delivery did you adopt as standard or loaded, to use your term, year?

A. What annual delivery in cubic feet?

Q. In M.c.f.

A. Yes, I used the figure 39,219,025 M.c.f.

Q. Well, you are reading the wrong figure, I believe, Mr. Morton?

A. From that figure, I eliminated 2,057,116 M.c.f. to get the figure shown on Line 16 of 37,161,909 M.c.f.

Q. It was the latter figure, namely, 37,161,909 M.c.f. that you did finally adopt as the annual delivery for the [fol. 3097] standard or loaded year, is it not?

A. For one or two of the comparisons I have made in the five studies, yes.

Q. Well, I would like to be clear on it. You did not use the 39,219,025 M.c.f. figure for any purpose, did you, in this study?

A. Except the starting point.

Q. In other words, you were working toward the 37,000,000-odd figure?

A. The latter figure, yes.

Q. And you used that 37,000,000-odd M.c.f. figure as the annual delivery for the standard or loaded year for purposes of this study?

A. Of course, you may appreciate by looking at page 2 that that figure itself was again adjusted to reach the standard for comparison.

Q. Yes.

A. However, that is the basic figure and I think that is the basic figure and the starting point.

Q. Well, so we won't have any misunderstanding about it in the record, and I hope we won't—

A. (Interposing) Neither do I, Mr. Littman.

Q. I certainly think we can get together on this. In your Method No. 1—I have been referring to Methods 1, 2, 3, 4 and 5 in the order in which they appear on Page 2 [fol. 3098] of Exhibit 38. You do not have any objection to my referring to them in that way, do you?

A. No.

Q. Now, what annual M.c.f. sales figure did you use in working out your Method 1?

Mr. Wheat: Mr. Littman, just so the record will be clear, couldn't we have the record show that what you are referring to now is Method 1 is what Mr. Morton has headed, "Direct Investment-Volume Method".

The method that you are referring to as No. 2 is Mr. Morton's "Direct Investment-Revenue Method".

The method you are referring to as No. 3 is Mr. Morton's "Direct Investment-Max. Day Method".

The method you are referring to as No. 4 is Mr. Morton's "Adjusted Base Year-Volume Method."

And the method to which you are referring as No. 5 is Mr. Morton's "Adjusted Base Year-Revenue Method."

It seems to me that with that in the record, we can be completely clear.

Mr. Littman: Yes, indeed, I think that will assist materially in conducting this cross-examination.

The Witness: To answer your question, Mr. Littman, Page 2 plainly shows there on Line 28 that I did use the figure that we were speaking of, of 37,161,909 M.c.f. brought over from Line 16.

[fol. 3099] It is self-explanatory almost there, if you notice.

Mr. Littman: Sometimes.

Mr. Culton: Line 5 divided by Line 16 is what you referred to?

The Witness: Yes.

By Mr. Littman:

Q. And that same 37,161,909 M.c.f. figures is also used in connection with Method No. 4, is it not?

A. Yes.

. . . . . .

By Mr. Littman:

Q. At the time we reached the recess, you had given us the three basic figures for the so-called loaded or standard year, namely, the figures for the total daily capacity and for the annual delivery and for the annual revenue.

Now, what was the delivery load factor during your standard or so-called loaded year?

A. I do not recall having that figure. I cannot tell you right off what the load factor was during the standard or loaded year.

[fol. 3100] Q. Mr. Morton, wouldn't it be calculated in this way? You have a slide rule there and a calculator there, and you tell me if I am wrong.

Take the 37,161,909 M.c.f. shown in Column F. of Line 16 and divide by 365 days to get the average M.c.f. sales per day. That would be your first step?

A. Correct.

Q. Now, what would you get?

A. 102—

Q. You are working the slide rule, aren't you?

A. Yes.

Q. We get 101,813 M.c.f. as the average daily delivery. Wouldn't you divide that figure by the 125,000 M.c.f. shown in Column F, Line [redacted], called "Maximum Line Capacity-Daily M. C. F." to secure the delivery load factor for the standard or loaded year?

A. Now, I defined load factor the other day as being the ratio between the maximum delivery and the average delivery for any given period. The figure you have read would be to divide the average day by the maximum line capacity so that the answer to your question is "no."

Q. Suppose then, Mr. Morton, you use the actual peak day delivery shown in Line 17, Column F in the amount of 121,455 M.c.f. instead of the 125,000 M.c.f. and tell me what load factor you would get?

[fol. 3101] A. The answer is 84 percent, in round numbers.

Q. Yes, we get 83.84, certainly close enough.

Now looking again at Line 18, I notice that you have in Columns A, B, C, D and E, during the entire 4½ year period from April 1, 1932 to September 30, 1936, inclusive, the figure of 80,000 M.c.f. as the "Maximum Line Capacity-Daily M. C. F." Is that correct?

A. Yes, sir.

Q. What does that 80,000 figure mean? What does it really represent?

A. That represents the capacity of the pipe line during those years, the maximum daily capacity of the pipe line during those years.

Q. In other words, if I correctly understand you, that is the most gas that Panhandle Eastern Pipe Line Company could be expected to get through their lines in any given 24-hour period?

A. Yes, sir.

Q. I presume there are some minor exceptions to that, are there not, Mr. Morton?

A. Yes.

Q. Because I notice immediately above the 80,000 figure, in Column E, the actual delivery in the maximum day as shown in Line 17 exceeded somewhat the rated capacity, if you don't mind my calling it that?

[fol. 3102] A. Yes, that is true.

Q. But, for all practical purposes, the 80,000 represents the true daily capacity during that 4½ year period?

A. Yes, sir.

Q. Now, looking to the extreme right of Line No. 18, I note that the capacity of your system increased from 80,000 M. c. f. to 125,000 M. c. f.

That is to say, between the period shown in Column E, to-wit, January 1, 1936, to September 30, 1936, and the period shown in Column F, namely, October 1, 1936, to September 30, 1937, the capacity of the system was increased by 45,000 M. c. f. per day, is that correct?

A. Yes, that is true.

Q. I should have called that daily capacity?

A. Yes.

* * * * * * * *

[fol. 3103] Q. Now, we were discussing the fact that the daily capacity has increased from 80,000 M. c. f. to 125,000 M. c. f. as shown in Columns E and F.

Now, assuming Mr. Morton—before we go to the next question—that was an increase of approximately 56 percent, was it not?

A. Yes, sir.

Q. Assuming that the pipe line was delivering at 100 percent capacity throughout 365 days in any year between

April 1, 1932, and September 30, 1936, what amount of gas would have been delivered annually on that basis?

A. 29,200,000.

Q. That is secured, is it not, by multiplying 80,000 M. c. [fol. 3104] f. daily capacity in the 4½ year period by 365 days, is that correct?

A. Correct. I should have said, 29,200,000 M. c. f.

Q. Doesn't that figure of 29,200,000 M. c. f. represent 7,961,909 M. c. f. less than the annual deliveries which you took for the standard or loaded year delivery?

A. That is correct.

Q. You took for your standard or loaded year a delivery figure of 37,161,909 M. c. f. shown in Column F, Line 16, did you not? A. Yes, sir.

Q. In other words, in order for the pipe line to have delivered the amount of 37,161,909 M. c. f. which it delivered in your loaded year, the pipe line would have been called upon to deliver 7,961,909 M. c. f. in excess of its total annual capacity in any of the years prior to October 1, 1936, is that correct?

A. That is the result you get from this mathematical computation, yes, sir.

Q. Well, isn't it true?

A. Yes, that is true.

Q. In other words, to put it in more simple language, the system, as it existed during the entire 4½ year period shown in Columns A, B, C, D and E, from April 1, 1932, to September 30, 1936, could not have delivered anything like 37,161,909 M. c. f., could it?

[fol. 3105] A. It could not.

Q. You would not mind telling us, would you, for the purposes of the record, what percentage does the 7,961,909 M. c. f. represent of the 29,200,000 M. c. f. figure? We get, 27 percent. Is that right? A. 27, plus.

Q. Assuming that prior to October 1, 1936, the pipe line had been delivering gas at the load factor which you have stated for the loaded year, namely, 84 percent, what annual delivery would have resulted?

A. You are asking now—I just want to get the record straight, or be sure I understand you—how much gas would have been delivered in a 12-month period if—

Q. (Interposing) Prior to October 1, 1936.

A. Prior to October 1, 1936, if the pipe line had operated at 84 percent of its capacity. I get out of that, 24,600,000 M. c. f.

Q. That is pretty close. We have 24,528,000 M. c. f. Is that not about right?

A. That is satisfactory.

Q. The slide rule does not come quite as close, does it, in such large figures? A. That is true.

Q. Now, this amount of 24,528,000 M. c. f. represents how much less than the annual delivery in your loaded year?

[fol. 3106] A. That would be 37,161,909 less 24,600,000, both in M. c. f., or approximately 12,500,000 M. c. f.

Q. And that amount of 12,500,000 M. c. f. represents what percentage of 24,528,000 M. c. f.?

A. That is approximately 51 percent.

Q. Have you ever seen Exhibit No. 58, Mr. Morton, which—

A. (Interposing) I believe I have. I do not recall at the moment, however.

Q. Suppose I hand you my copy of it. It is an exhibit which was prepared and submitted by Witness Watkins entitled, "Statement of Gas Revenue, Period from April 1, 1932, to June 30, 1941".

Now, before I inquire about any figures on this exhibit, did you help in the preparation of this exhibit, Mr. Morton? A. I did not.

Q. You have seen it before, however?

A. I have seen it.

Q. Can you state, as the company's rate engineer, whether or not the average M. c. f. figures shown in Column B in Exhibit 58, Schedule 1, are correct?

Mr. Wheat: I read that "average Per M c. f."

Mr. Littman: Average per M. c. f., that would be more accurate.

The Witness: Undoubtedly, those figures are correct.

By Mr. Littman:

[fol. 3107] Q. What would you consider to be a representative average figure per M. c. f. for the 4½ year period prior to October 1, 1936, during which period you state the pipe line capacity was not used to full capacity?

A. Between 21½ and 22 cents per M. c. f.

Q. Well now, using that figure and assuming that the pipe line had been operated at a 100 percent load factor, that is, at 100 percent capacity throughout the entire 4½ year period prior to October 1, 1936, will you state what annual revenue would have resulted in each of the periods shown in Columns A, B, C, D and E, in your Exhibit 38, using the average revenue of 22.6 cents?

* * * * * * * * *

Mr. Littman: You said 22 cents?

The Witness: I used the figure 21½ to 22 cents?

Q. We will use the 22-cent figure, I am sorry.

A. I would just as soon use the 21.6 if that is what you have there. In these engineering calculations, the round figures, we frequently use them.

[fol. 3108] Q. Suppose you use the figure 22, Mr. Morton, which is your figure, the 22-cent figures which is the one you said would be the most representative of the average revenue for the 4½ years.

Trial Examiner: The statement, as I recall, was between 21½ and 22, is that right, Mr. Morton?

The Witness: Yes, that is so.

Trial Examiner: If you are going to make some extended computations, I suggest you get at your average figure accurately and use that instead of an assumed figure.

By Mr. Littman:

Q. Which one would you feel would be more representative?

A. I feel we could use 21.75 satisfactorily.

Q. All right, then suppose we use that amount.

A. Now, I am multiplying for the calendar years 29,200,000 M. c. f. by 21.75 cents. The result is $6,350,000. That would have been the revenue each of the calendar years on the premise that you have made, and for the two; nine-months' period, we would have had 75 percent of $6,350,000, which would be $4,760,000 that the revenue for the entire period would have been three times $6,350,000—

Q. (Interposing) I do not particularly care for a cumulative figure, Mr. Morton.

A. I was thinking you had asked for it.

[fol. 3109] Q. Well, let's see. In other words, if Panhandle Eastern Pipe Line Company had been using its lines at 100 percent capacity throughout every day of the 4½ year period prior to October 1, 1936, which period you use as the "Not Fully Loaded Period", the total revenue would have been $6,350,000 per year, per calendar year?

A. Correct.

Q. Whereas, the revenue in your loaded year of October 1, 1936, to September 30, 1937, was $8,953,083 as shown in Line 10, Column F, is that correct?

A. Yes.

Q. In other words, to put it more simply, Panhandle Eastern Pipe Line Company could not have possibly reached any revenue approximating the $8,953,000 which it reached in your loaded year—it could not have accomplished that with its existing capacity in any of the 4½ years which preceded the loaded year. Is that a correct statement, in more simple form?

A. That is true.

Q. In other words, I am correct, am I not, in stating that the revenue in the loaded year of $8,953,083, as shown in Column F, Line 10, is 141 percent of the total revenue that could have possibly been obtained in any preceding year, even if the system had been operating at 100 percent capacity in every day of those years and sold the gas at the prevailing price that you mentioned?

[fol. 3110] A. That seems to be approximately correct.

Mr. Wheat: What was that percentage, Mr. Littman?

Mr. Littman: 141.

Mr. Wheat: Thank you.

By Mr. Littman:

Q. Assuming that the pipe line had been operated at an 84 percent load factor which you calculated for us a few moments ago, during the entire 4½ year period prior to October 1, 1936, will you please state what annual revenue would have resulted in each of the periods shown in Columns A, B, C, D, and E, using your average revenue of 21.75 cents per M.c.f.?

A. I believe that is the figure that I had started to give you a while ago; that is $6,350,000 for each of the

three periods, B, C, and D, and 75 percent of that is $4,760,000 for the two periods A and E, that is, the two nine-months' periods.

Q. I do not believe you are answering the specific question I have put to you, Mr. Morton. I appreciate that this line of inquiry may be rather difficult to follow, but I am going to ask that the question be read again and see if you wish to make a correction.

. . . . . .

By Mr. Littman:

[fol. 3111] Q. You see, what I want is the annual figure. You do not need to give us the figure for each column. I want the annual figure.

A. I was apparently giving the 100 percent load factor figure. As I understand it now, we would multiply the capacity of 80,000,000 by 84 percent by 365 to obtain 24.6 million M.c.f. which, in turn, we multiply by 21.75 which I calculate here on the slide rule to give us an annual revenue of $5,350,000.

Q. In other words, to state it more simply, the $5,350,000 revenue figure which you just named is that revenue which Panhandle Eastern would have derived per year prior to October 1, 1936, if the system had been operated at an 84 percent load factor and assuming the revenue of 21.75 cents per M.c.f.?

A. That is approximately correct, as I see it.

Q. Now, this revenue in the loaded year shown by you in Column F, Line 10, of $8,953,083 represents what percentage of the revenue figure which you just named in the amount of $5,350,000?

We get 167 percent.

A. I get 167 percent.

Q. Well, it is clear, is it not, from these calculations, that in your study as shown in Exhibit 38, you have compared the use of the system as it existed in the 4½ years [fol. 3112] prior to October 1, 1936, with the use of a system having more capacity than was actually available and installed during those 4½ years, is that correct?

A. Not directly, not without proper consideration of the fact that during the loaded year more capacity had been

put into the line, not without adjustment for the additional capacity.

I have not made a direct comparison between, let us say, a large apple and a small peach. I have adjusted that apple to the size of the peach before making any comparisons.

Q. Did you make any adjustments, such as that which you have described in connection with your methods Nos. 1, 2 and 3?

A. In No. 1, we might discuss them separately, here is what I did: In No. 1, I show the investment per M.c.f. during a loaded year and the other years.

Q. Without adjustment?

A. No adjustment is necessary for that kind of a comparison.

Q. Well, we may quarrel about that a little later, but the fact of the matter is, that you made no adjustment in your Method 1, did you?

A. Only the adjustment that is inherent in comparing investment per thousand during one year with investment per thousand during another period.

[fol. 3113] On its face, it would be quite an unfair comparison to adjust either one of those figures either up or down. That is a very simple thing.

The investment per thousand cubic feet sold during this year as compared to the investment per thousand cubic feet during some other period, there is no adjustment there, that is a very simple calculation.

Q. Mr. Morton, what do you mean by the term "capacity" as it is used in the title of Page 2 of Exhibit 38, "Five Different Methods of Calculating Interest, Ad Valorem Taxes and Operating Expense Attributable to Unused Capacity"?

A. I can best describe that by saying that capacity, as we use the term here, is not limited strictly to the physical carrying capacity of the pipe line.

That term as used here, embraces the conception of capacity to earn money as well as the capacity to carry gas physically through the line.

Q. Then it does not mean capacity of the pipe line, does it?

A. It is not limited strictly to capacity of the pipe line.

Q. Well, does the term "capacity" as you have used it in that caption include capacity in the sense that it has reference to the capacity of the pipe line?

A. It does.

[fol. 3114] Q. You are referring then in your caption to unused capacity of the pipe line system of Panhandle Eastern or not?

A. I have just explained what I meant by capacity as used here, Mr. Littman. I hesitate to repeat it again. We can have it read back again—

Q. (Interposing) I am afraid I did not understand your answer, Mr. Morton, which is why I am asking the question again in a little different way. To me, it seems that the word "capacity" expresses capacity of a pipe line.

You say, as I gather it, it might or might not. I want you to tell me what you mean by it.

A. I might amplify that, yes, to this extent.

You will notice in Method 2 there, for example, "Direct Investment-Revenue Method", in that method I compare the investment that has been put in this pipe line per dollar of revenue taken from the sale of gas, the investment per dollar during a year when the pipe line was earning and going to town, as we say, with periods when the pipe line was not earning and was not doing so well, when its inherent capacity for earning was there but was an unused earning capacity.

Q. Then you are speaking, in Method 2, of earning capacity, are you?

A. There is no reference in Method 2 to the physical daily maximum ability of the pipe line to carry gas. Some [fol. 3115] of these methods are not related at all to the physical ability of that pipe line to carry gas, except in so far as earnings are related to ability to carry gas.

Q. Well, let's be specific and let's look at Method 2. In Line 34, you use the term "Percent Used Capacity". Now, what kind of capacity are you talking about there?

A. That method has no reference to any particular capacity other than the one that I have described as capacity.

Let's examine a little closer and see if I can get what you are heading at, Mr. Littman. In Line 1, we show the investment per dollar of revenue received.

Mr. Culton: You mean, Line 33?

The Witness: Line 33, thank you.

We show investment per dollar of revenue that was inherent in this pipe line during those various periods. That is to say, let's select, for example, the year 1934.

We had an investment in this pipe line of $15.78 per dollar of revenue taken from it.

By Mr. Littman:

Q. In twelve months?

A. In twelve months, but during another twelve months period, when the line was loaded and when it was earning a revenue somewhat commensurate with the plan of those who started the project, the investment per dollar of revenue at that time was $4.92, so that in 1934 we had three [fol. 3116] times as much investment per dollar of revenue taken out of the line as we had during the year when the line was doing what it was supposed to do.

Therefore, we conclude that we had only about 30 percent of its capacity used during the year 1934, or, another way to put it, about 70 percent of that investment per dollar of revenue that was inherent in this situation in 1934 was there because of some future time and not being used in the year 1934.

Q. Well, you use the $4.92 shown in Line 33 as 100 percent, do you not?

A. You may call it that.

Q. What do you call it in this exhibit? What do you call that?

A. I have never called it—I see right underneath I have 100. That is O. K., 100 percent.

Q. What do you label it in this exhibit?

A. 100 percent, a base for comparison.

Q. What do you label it in this exhibit? What do you call it in this exhibit, 100 percent?

A. Do you wish me to read Line 34?

Q. Yes.

A. Percent used capacity.

Q. Yes. Now, what does that have to do with capacity, Mr. Morton? Where does capacity enter into that figure at all?

A. I think, Mr. Littman, it is apparent on its face, I [fol. 3117] cannot go any farther than to point out to you what that line says and again repeat that the figures shown on Line 34 represent my calculation of the percent of used capacity in the system at those different periods.

Q. Now, the term "Percent Used Capacity", as you have used it in Line 34, does not have anything to do with the capacity of the pipe line system to carry gas, does it?

A. Only in so far as whatever relationship there is existent between investment and revenues and ability to carry gas.

Q. Could you answer my question yes or no?

A. I do not believe I could answer your question yes or no.

Q. Well, your 100 percent "percent used capacity" relates to a dollar figure, $4.92, doesn't it? A. Yes, sir.

Q. And the $4.92 merely represents the amount of investment per dollar of revenue received for the gas which was actually sold in the period October 1, 1936, to September 30, 1937, and that is all it represents, is that correct?

A. That is correct.

Q. As a rate engineer, do you think it is proper to call such a figure 100 percent used capacity, Mr. Morton?

A. I think it is all right to use this figure in arriving at my conception of the percentage of used and unused capa- [fol. 3118] city during these different periods.

Q. I understand that, but I am asking you whether or not you consider the terminology or the description which you have used of "percent used capacity" as properly descriptive of $4.92 which was derived in the manner I have described?

A. Yes, I think, as I have used it here, it is properly done.

Q. Well, what would you call the percent that would be arrived at by making an actual determination of the actual daily capacity of a pipe line? Would that also be "percent used capacity" for 100 percent?

A. That could be used as one of the methods, yes, sir.

Q. In one instance, you would have the total capacity in M. c. f. as representing "percent used capacity" and, in

another case, you would have $4.92 and you would call it the same thing?

A. That would be all right.

Q. Well, I guess you could call anything most anything you want, Mr. Morton, but I want to make certain that we understand that you do not claim that the figures in line 34 represent used capacity of the pipe line itself.

A. Well, of course, we both realize that there can be a great deal of play on terminology, Mr. Littman.

Q. Let's look at the term that you use in Line 29, "Percent Used Capacity". At the end of that line, you have [fol. 3119] in Column F, 100. Is that 100 percent used capacity? Is that what you mean by that figure?

A. Yes, that means what it says.

Q. But it says exactly what Line 34 says, doesn't it?

A. Yes, it says the same thing. I have used the same description all the way through.

Q. Does it mean the same thing?

A. Yes, it means the same thing.

Q. Well, you have $1.18 there whereas you had $4.92 down below; do you still say it means the same thing?

A. Yes, it is just another way of doing the same thing.

Q. Using the same words to describe it?

A. That is all right for this study.

Q. When you use the term, "Percent Used Capacity", you are not referring to the physical capacity of the pipe line, are you?

A. Only in so far as it might be related to investment or earning power. There is a certain relation, we must both of us concede, that there is a very close relation between capacity of the line, the physical ability to carry gas, its capacity to earn and the investment that is in there for the purpose of establishing a going and earning proposition.

Q. Now, in the line immediately above Line 29, that is, in Line 28, you have the term "investment per M. c. f.", and that is derived, is it not, simply by taking the invest- [fol. 3120] ment in each of the periods shown on the previous page and dividing that investment by the number of M. c. f.'s sold in that year?

A. That is the way to do it, yes, sir.

Q. That gives you $1.18? A. Yes, sir.

Q. And you call that 100 percent capacity?

A. Yes, sir, $1.18 investment per M. c. f. during the loaded year is 100 percent capacity in this study.

Q. Now, I believe you said that that $1.18 has something to do with the physical capacity of the pipe line. Let's see whether it has. As you just stated, the $1.18 is obtained by a straight mathematical division.

Was the total number of M. c. f.'s sold in the year October 1, 1936, to September 30, 1937, the total amount of M. c. f.'s that could be sold? Does it represent the capacity of the pipe line? You can answer that yes or no, can't you?

A. No.

Q. Now, does the investment figure which you use in Column F, line 16—I beg your pardon, Column F, Line 5—does that investment have anything to do with the capacity, physical capacity, of the system? You can answer that yes or no, can you not? A. Yes.

Q. In other words, I presume what you mean now is that since this particular amount of money that you used, [fol. 3121] that is, $44,022,170, in Column F, Line 5, represents total investment, that that investment had a certain capacity and that, therefore, the investment has something to do with capacity. Is that generally true?

A. That is a little more specific than I believe that I would care to make it. What I am answering is the general question, as I understand the question I am answering—is there any relationship between investment and capacity—and I just can answer that right out by saying that, in general, as your investment goes up your capacity goes up. There is usually, on pipe lines, some relationship between them.

Q. But it is not a direct relationship necessarily, is it?

A. I know that it is not a direct relationship.

Q. Now, let's look at your third method. There you used the same phrase, "Percent Used Capacity" in Line 39, 100 percent. This time, it means $362, doesn't it?

A. It means that the investment per M. c. f. on the maximum day during the loaded year was $362, that I used that as 100 percent capacity.

Q. In deriving that figure, did you use the actual capacity of the system for any 24-hour period?

A. I used the investment of the system divided by the maximum day on the system.

Q. Maximum day delivery?

[fol. 3122] A. Maximum day delivery.

Q. Not the maximum capacity of the system?

A. That is correct. That figure represents the investment that was in this project in the loaded year per thousand cubic feet carried on the maximum day's delivery.

Q. Well, obviously, the figure of $362, which you call "Percent Used Capacity", does not refer to the physical capacity of the pipe line system, does not?

A. It does not refer directly to the 80 million a day or the 125 million a day which we frequently refer to as the capacity of the system.

Q. In other words, your answer is, "no, it does not refer to physical capacity"?

A. That is correct.

Q. Now, let's look at the fourth method. There you used the identical term in Line 44, "Percent Used Capacity" and you have 100 percent.

This time it refers to 23,783,622 M.c.f., does it not?

A. Yes, it does.

Q. And that was not the M.c.f. capacity, was it, of the system for the year October 1, 1936, to September 30, 1937?

A. No, that was not the physical capacity of the system.

Q. In your Method 5, you used the same term again, "Percent Used Capacity" and there, this time, it means $5,729,973. Those dollars are what, revenues?

[fol. 3123] A. Yes, that is revenue.

Q. Revenues for 12 months, are they not?

A. Yes, sir.

Q. That would have been derived upon certain assumptions? A. Correct.

Q. Now, you would not say that, in these circumstances, the 100 percent refers to any such thing as the capacity of this pipe line system, would you?

A. Mr. Littman, you have asked me that several times.

Q. But we are on a new method. We are on the fifth method, you know.

A. If we are trying to get at the facts here, let's get at them. I have previously told you what my conception of capacity as used in this study is, and I have not changed it since we started the examination on these five different methods.

There is a relation, as I said before, and I want to make it plain that I do believe and I think it is generally conceded that there is some relation between earning power, investment and ability to deliver, or capacity.

There is some relation there that is very plain to anyone who has fundamental ideas about pipe lines. In general, the greater your capacity, the more money you have to have in the system.

[fol. 3124] Now, there is a relationship. I cannot say that none of these methods are not related at all to physical capacity. I do not want to say that.

Q. Well, they are not very much related to physical capacity, are they?

A. I do not know how much.

* * * * * * * *

[fol. 3125] Q. Mr. Morton, will you please turn to Page 2 of Exhibit 38. In Line 28, you used the term, "Investment Per M.C.F." Does that refer to the M.c.f. annual sales?

A. Yes.

Q. Well now, two of these periods that you have, namely, the period shown in Column A and in Column E, are not annual periods, are they? A. That is correct.

Q. What M.c.f. sales did you use for those two periods?

A. Well, I did there what I have explained before. It is not comparing a big apple with a little peach. I reduced them to the same basis.

On my direct examination covering this, I stated that I had made proper adjustment for nine-months' periods, so that, what I have done is to take a nine-months' period and set it up to what it would have been over a year's period at the same rate.

[fol. 3126] Q. Where did you make that adjustment?

A. Well, now, that remark I made is to apply to those places where such adjustment is necessary to reach a proper answer.

Now, in this direct investment—volume method—

Q. (Interposing) That is No. 1?

A. No. 1, the intermediate step does not show. Let's see if I can show you how we got that. I have divided Line 5 by Line 16.

Q. In each case?

A. And for the Column E, let us examine that. I take 40 million and divide it by 15.5. Now, there is one—

Q. (Interposing) Would you mind spelling out those figures?

A. Yes, I take 40 million from Line 5 and divide it by 15.5 at Line 6.

Now, that gives me 259, which we get—

Q. (Interposing) What is this 15.5 that you are talking about? I would like to have you read the entire figure, if you don't mind.

A. All right. I have divided the total investment shown on Line 5, just as the exhibit shows—

Q. (Interposing) Column F?

A. Column E.

[fol. 3127] Mr. Wheat: That is $40,109,403?

The Witness: $40,109,403 by the figure found on Line 16, Column E, which is 15,512,181 M. c. f.

By Mr. Littman:

Q. That gave you what? A. That gave 259.

Q. $2.59? A. Yes; $2.59.

Q. Now, you do not mind if I make it clear, that is the figure shown on Column E on page 2, Line 28?

A. That is correct.

Q. Before you go to the next step, that figure of $2.59 is not investment per M. c. f. of annual sales, is it?

A. Let me examine that a minute.

Q. Perhaps we could save time, Mr. Morton, by suggesting that possibly you made your adjustment in the 60.74 figure which appears in Line 29, Column E.

A. Yes, thank you, Mr. Littman, that is correct. I was disturbed for a moment there to see that the $2.59 is not the investment per M. c. f. of annual sales. That figure is the investment per M. c. f. of nine months' sales.

The adjustment to take care of the nine-months' period is made in the next line.

Q. And the adjustment is not in the $3.59 figure?

A. That is correct. I do not doubt, if you will wait [fol. 3128] just a moment and I will check this, that I have taken 75 percent of the $2.59 to get a figure which would be comparable to $1.18 which shows in Column F and, sure enough, that is the way it works out.

Q. So that we may agree, may we not, Mr. Morton, that the $2.59 figure shown in Column E, Line 28, as investment per M. c. f. is not comparable to the $1.18 figure in the same line in Column F, is it?

A. That is correct and let me add that the percentages underneath that are derived from these figures with proper adjustments, however, are comparable, in my opinion.

Q. And is the same situation true with respect to the $10.61 figure which appears in Line 28, Column A, for the nine-months' period, April 1, 1932, to December 31, 1932?

A. Yes, that is true.

Q. And that figure is not comparable to the $4.43 figure which appears in Column B on the same line?

A. That is correct.

Q. Now, are there any other instances where that situation prevails as between nine months and one year's period? Don't you have the same situation—

A. (Interposing) We do all the way through, and I believe it is in four of the five methods, as I recall it now, but I am sure in at least four of the five methods it was necessary to adjust for nine months' periods. Of course, [fol. 3129] it is apparent on the face of it that it is not fair to compare a nine-months' figure to an annual figure.

Q. Yes, and we wanted to make certain that we understood the mechanics behind these figures so that we would not improperly compare them.

Now, turning back to Page 1, if you please, I think you have a typographical error probably in one of these figures. You do not mind if we make a correction, if that is the case, do you, Mr. Morton?

A. Not at all. I would not be surprised to find an error.

Q. Well, suppose you look at the figures in Column D on Page 1, particularly the figure in Line 14, "Argus, Local Area and Transported", in the amount of 25,510,846 M. c. f.

A. Yes.

Q. Isn t there a correction to be made on that figure?

A. Yes, undoubtedly there is come correction to be made there. I am looking back through my working papers to find the correction.

The figure on Line 14 should read, "15,510,846 M. c. f."

Q. That is the figure in what column?

A. Column D, Line 14.

Q. That should be 15,510,846 M. c. f.?

A. Yes, sir.

[fol. 3130] Q. Now, Mr. Morton, just before the noon recess we were talking about comparing the use of the system as it existed in the 4½ year period prior to October 1, 1936, with the use of the system having more capacity than was actually available and installed during those 4½ years, and I believe you stated that an adjustment had been made to take care of that situation, did you not?

A. Yes, sir.

Q. And I believe you stated that that adjustment had been made to compensate for that comparison in all five methods?

A. Wherever I thought it was required. I can trace it [fol. 3131] through to find out whether it was in five, or just four of the five. I believe it is immaterial at the moment.

Q. Let me get at it this way: The adjustment that you spoke of with respect to Method 1 was the weighting of the investment in the respective years, was it not? That is, you took into consideration the amount of investment in plant in each of the years compared. Was that what you referred to when you said you took into consideration the difference between the situation as it existed in the 4½ year period prior to October 1, 1936, and in the year after October 1, 1936?

A. Yes, in that method I took into consideration the investment per thousand of cubic feet sold during each period.

Q. But isn't it true, that in that method, namely, Method No. 1, you did not take into consideration or make an adjustment of those periods on the basis of the actual physical capacity of the system?

A. We are back where we started on that. Would it help any, Mr. Littman, if we just would strike out the title that we have used on Lines 29, 34, 39, 44 and 49 and just, instead of saying, "Percent Used Capacity", just leave that line blank and not name that at all?

This phraseology that I have used here or terminology, "Percent Used Capacity" is an engineer's choice of words attempting to describe something that he thinks pertinent to the answer, and I did not spend a great deal of time in [fol. 3132] selecting that title.

Now, if it would help us any, I would be glad to make that line blank, just show percentages, because it is only a working step to the answer that you find on that line entitled "Percent Used Capacity" all the way through.

Q. I think it would be helpful, and I think it would eliminate some confusion that has resulted among the staff and myself. I certainly concur. If you wish to suggest a different title or one that more closely describes the situation, why, that would be satisfactory, but if you say it is purely a working step, I think we could strike it.

A. That is my suggestion. Now, any name that you might designate for it—

Mr. Wheat: (Interposing) You would leave, wouldn't you, the parentheses showing what you did in that line?

The Witness: Certainly, only to help in tracing through the computation, however.

By Mr. Littman:

Q. Now, this striking of "Percent Used Capacity" would apply to each of the five methods, would it not?

A. Yes.

Q. That is Line 29. How about Line 30, "Percent Unused Capacity." That is the same situation, is it not?

A. Now, let's consider that a moment. That "Percent Unused Capacity" is one of the basic figures I am using to [fol. 3133] get at my answer and I would not care to strike that line without giving it some thought.

Q. Well, let's strike the "Percent Used Capacity" for the time being.

Mr. Culton: We are not striking that. He said, if you want to strike it completely, the words mean nothing. If

you do not understand them—we think that the words are very accurate and the fact that you do not understand them does not mean that we do not understand the way they were used, so we are leaving them in the exhibit as they are.

If you cannot understand those three words and want to strike them from your mind and leave what he says there as being what he has done there, that is O. K.

Mr. Lee: Why can't you clarify it by putting in a definition of what you mean?

Mr. Culton: We think he has made a very clear definition, and if counsel cannot understand it, it is frequently like I am when somebody of another profession says something, it is just one of those things that sometimes happens to us lawyers.

Mr. Littman: We understand it, that is not our difficulty, Mr. Culton, but we could never understand why he called it what he did.

Mr. Culton: I have lots of times been unable to understand testimony. That is just one of the unfortunate results of being a lawyer and trying cases where other pro- [fol. 3134] fessions are involved.

Mr. Lee: The question is, doesn't it leave the impression that it is the capacity of the line he is talking about? That is the impression I got from the exhibit.

Mr. Wheat: Isn't it true, Mr. Littman, that since the examination has been had and the witness has explained so fully what he did and everything, there is certainly nobody that is fooled by this terminology and, as the witness has stated, if you have some suggestion as to some other terminology, I am sure we would be glad to consider it.

I do not think anybody is under any misapprehension at all as to what the witness was trying to do and what he did and he has stated that there is a general relationship all the way through between these various things that he has for his own purposes labeled, "capacity."

Mr. Littman: I personally think your witness' suggestion is an excellent one, but if you do not believe that it is

a good one, why, I presume you can do as you please about it.

By Mr. Littman:

Q. Well, getting back to our question, comparing the system before September 30, 1936, with the system after October 1, 1936, in the first three methods shown on Page 2, you did not make any adjustment in direct proportion to the difference in physical capacity of the pipe line as it existed in those two periods?

[fol. 3135] A. That is correct. I felt that the fact that I was stating "Investment per M.c.f." was a sufficient comparison between one period and another, without making any kind of adjustments.

As a matter of fact, an adjustment in a situation like that would, in my opinion, have been out of order.

Q. An adjustment of what kind would have been out of order?

A. An adjustment in a situation like that would have been out of order.

Q. Now, Mr. Morton, looking at the adjusted base year method which we have called Nos. 4 and 5, I notice that you have an adjusted base year method starting in Line 42 that seems somewhat comparable to Method 4, that is, Method 1 is "Direct Investment-Volume Method"; Method 4 is, "Adjusted Base Year-Volume Method".

I also note that you have an "adjusted base year-revenue method" which seems to be comparable to the method of No. 2 which was a "direct investment-revenue method."

Now, why didn't you show a sixth method on this page, namely, "Adjusted Base Year-Max. Day Method"? It appears to me like one of these is left off.

A. In making that comparison, I have compared the investment to the Max. day for each of those periods. That is to say, I show what the investment is per M.c.f. of gas [fol. 3136] delivered on the Max. Day.

Mr. Wheat: You mean, you are talking about Method 3 now?

The Witness: I am talking about Method 3. For example, taking the year 1934, I took the total investment

that we had in 1934 and I divided it by the maximum day that obtained on the pipe line in 1934 and I found that the investment per maximum day delivery was $779.

Now, during a loaded period which would be that shown in Column F, I divided the investment of that year by the M.c.f. sold on the maximum day and I got $362.

Now, it is quite apparent that the 1934 figure is almost twice as large as the loaded year figure. Therefore, I said about half of the investment was being used and about half of it was not being used during 1934 and it seemed to me that no adjustment of any kind, such as you have questioned me about, was necessary to complete the comparison.

Mr. Wheat: Mr. Littman, I believe possibly the witness has confused what you said in your question.

Mr. Littman: I am afraid he has.

Mr. Wheat: May I just ask a question that may clear that up. As I understood Mr. Littman, he asked you why you did not add a sixth method which would be "Adjusted Base Year-Max. Day Method."

Well now, if you had tried to make a sixth method on that basis, your answer just now given would show that [fol. 3137] you could not have an adjusted base year of a maximum day, could you? You were using a maximum day, weren't you?

The Witness: There might have been some adjustment that another calculator could have made there, so I cannot say there could not have been such, but I cannot concede, any logical way of setting up a method that compares to Method No. 3.

By Mr. Littman:

Q. Let me ask you this, Mr. Morton, these five methods that you have set forth on Page 2 of Exhibit 38 are not the only methods that you have worked up, are they?

A. I have worked out other methods; roughly, however.

Q. Have you ever worked out the method that I just described?

A. No, sir I never worked out an adjusted Max. Day method.

Q. What would you think of such a method? You have told me you did not think it was necessary to make an adjustment of your Method 3, but here is another method that seems to follow quite logically from your Method 3. What would you think of such a method?

A. I would have to see how it would work out. I would have to have more details. Offhand, it seems to me you have done a fair job and done all that you can do along that line when you take the investment of each year and [fol. 3138] divide by the maximum day of each year.

Then you automatically take care of any fluctuations in investments and Max. Day. You are comparing a unit there, which unit is investment per Max. Day of sales on this pipe line.

Q. Well, you worked out a so-called supplemental method for Method 1 which you have put in here as Method No. 4. They are more or less comparable, aren't they?

A. They are comparable at some points, yes.

Q. In other words, in the fourth method you use the Volume Method, do you not?

A. Yes, I do. I relate the volume of each year to the volume of the loaded year with proper adjustment before that relation, however, of the loaded year.

Q. Now, with respect to your second method, called "Direct Investment-Revenue Method", you have offered a supplemental method called "Adjusted Base Year-Revenue Method", which has many features in common with your No. 2 Method?

A. Yes, I would say so.

Q. But you did not do that, Mr. Morton, when you came to your third method, called "Direct Investment-Max. Day Method". I wonder whether you have told us fully why you did not do it? Have you given all of the reasons that you can think of as to why you did not do it?

A. The mere fact, Mr. Liftman, that four resembles one and the fact that five resembles two, would not make it [fol. 3139] necessary that you set up a six to resemble three. Your logic is that since I have two pairs here, I should have three pairs.

Q. You do not mind my natural curiosity, do you, in that regard?

A. Not at all, just go right ahead.

Q. You could now express no opinion as to the validity of such a method or do you want to express an opinion as to the validity of using a comparable so-called adjusted "Base Year-Max. Day Method". What would be wrong with doing that?
